## COMPRISING THE

> SPECIFIC CHARACTER, DESCRIPTION, CULTURE, HISTORY, APPLICATION IN THE ARTS, AND EVERY OTHER DESIRABLE PARTICULAR RESPECTING ALL THE PLANTS INDIGENOUS TO, CULTIVATED IN, OR INTRODUCED

> INTO
> BRITAIN.

NEW EDITION, CORRECTED TO THE PRMSENT TIME.

Edited by MRS. LOUDON;

ASSISTED BY
GEORGE DON, F.L.S. ; AND DAVID WOOSTER, LATE CURATOR OF THE IRSWICH MUSEUM.
I. 0 ND 0 N :

LONGMAN, BROWN, GREEN, AND LONGMANS.
1855.

$\mathbf{I}_{\mathrm{N}}$ this Encyclopædia are included all the indigenous, cultivated, and exotic plants which are now found in, or have been introduced into, Britain. The object of the work is to give a natural history of these plants, accompanied by such descriptions, engraved figures, and elementary details, as shall enable a beginner, who is a mere English reader, to discover the name of any plant which he may find in flower, refer it to its proper place, both in the Natural and Artificial Systems of Classification, and acquire all the information respecting it which is useful or interesting. It must be evident to all who are conversant with the present state of botany, and who know the number of plants which have been introduced into Britain, that to accomplish such an object within the limits of a volume is a task of no ordinary difficulty ; some explanation of the manner in which it has been executed may therefore be required.
The Work is divided into Two Parts. The First Part (p. [1.]) contains the Linnean or Artificial Arrangement of all the genera and species, with all the details comprehended in botanical description and natural and artificial botanical history, and with engraved portraits of one or more species of each genus. The Second Part (p. 1051.) contains the Jussieuean or Natural Arrangement of all the genera, without repetition of the species or any deiails connected with them: but as the names of the natural orders are added after each genus in the Artificial System, apd as each genus in both arrangements is numbered, a direct reference may be had from the second arrangement to the first, and from the first to the second; reference may also be had indirectly, through the medium of the Contents and Index.
An Introduction is given to each system of arrangement (p. [1.] \& 1051.), and a General Introduction to the whole work ( p . xix.), in which its uses are explained. When the beginner has a plant in flower and would ascertain its name, he will turn to the Linnean System, as explained in the Introduction to that system (p. [1.]) ; and, when he has but a small part of any plant, he will turn to the Natural System, as directed in the General Introduction (p. xix.).
All the Technical Terms, or words not usually found in an English dictionary, are explained in the Glossary (p. 1094.); and engravings are given of such of the objects designated as might occasion any difficulty to a beginner. This Glossary and the two Introductions (p. [1.] \& 1051.) form together a complete Grammar of Botany.
The Table of Synonymes in various languages (p. 1108.) may, to a certain extent, be considered as presenting the Popular Floras of the various countries where these names are used; since it is only to the remarkable plants of a country that vernacular names are given.
The signs used for the habits of plants (column 3.), and their duration in the garden (col. 4.), are improvements in botanical description by the Editor*, now applied for the first time. The twenty-three varieties of habit are indicated by figures of the plants themselves; as a grass for a grass, a bulb for a bulb, a plant floating on water for an aquatic, \&c., \&c., to recollect which requires no exertion of memory. A perennial is indicated by a triangle, instead of the old sign, $\psi$; an annual remains a circle as before, O , because, among other reasons, gardeners sow patches of annual flowers in circles ; and a biennial is a double circle, $\mathcal{O}$, instead of the old sign, $\mathrm{z}^{7}$. The bark stove is a square, $\square$; the dry stove three sides of a square, $\beth$; the green-house two and a half sides of a square, $\llcorner$; and the frame two sides of a square, - ; because these forms, if supposed to indicate the sections of plant-houses enclosed by glazed sashes, as actually built, will represent the different structures which are meant to be indicated. By combining the signs of duration with habitation, $\boxtimes \mathbb{D}$ ( description. Thus, in consequence of the single innovation of the triangle and the

[^0]square, we have simplified and extended the power of indicating the habits and habitations of plants by signs from ten, the usual number in the most complete botanical catalogues, to forty, the number employed in this work.

No farther explanation of the nature and uses of this work appearing necessary, it only remains to present the thanks of the Proprietors and of the Editor to Aylmer Bourke Lambert, Esq., F.R.S. V.P.L.S. F.G.S. \&c., for allowing Mr. Sowerby the freest use of his rich botanical library and extensive herbarium, for the selection of subjects to be engraved ; and to David Don, Esq., Lib. L.S., Mr. Lambert's librarian, for his unremitted and unwearied exertions, during upwards of seven years, to facilitate the labours of Mr. Sowerby. To Robert Brown, Esq., F.R.S. V.P.L.S. \&c.; to the Council of the Linnæan Society; and, again, to David Don, Esq., in his capacity of librarian to the Linnæan Society, the Proprietors are much indebted for similar services; and they beg leave to thank, in a very particular manner, Messrs. Loddiges of Hackney, for original drawings of many species, made from living plants in their unrivalled collection of exotics. Without the herbarium of Mr. Lambert, and the Hot-houses of Messrs. Loddiges, this work could not have been produced.

It remains only for the Editor to state, that the botanical merits of this publication belong entirely to Professor Lindley, F.R.S. L.S. G.S. \&c.; and J. D. C. Sowerby, Esq., F.L.S., \&c. The former gentleman determined the genera and the number of species to be arranged under them ; prepared the specific characters, derivations, and accentuations; either wrote or examined the notes; and corrected the whole while passing through the press: the latter, assisted by David Don, Esq., and Messrs. Loddiges, sought out the figures, dried specimens or living plants, necessary for illustration, and made drawings of them on the blocks to be engraved, in that accurate and scientific manner, and with that appropriate taste, for which his late father was long so much distinguished, and for which he himself has not yet been equalled in this or in any country. All that the Editor can deem to be his own is the plan of the work; and if this be found not to have failed in answering those expectations which the state of science, in botany and the compilation of books, might have warranted in 1822, when this work was commenced, he will have obtained all the approbation to which he is entitled.

Bayswater, May, 1829.

## J. C. L.

The Supplements which accompany the present edition of the Encyclopadia of Plants contain the most important species and varieties of plants which have been introduced into British gardens, or been originated there between 1827 and 1855. A new General Index is also given. The First Additional Supplement was prepared by Mr. W. H. Baxter, Curator of the Royal Botanic Garden, Oxford; and revised by George Don, Esq., F.L.S.; and the Second Additional Supplement has been prepared by Mr. Don, assisted by Mr. David Wooster, late Curator of the Museum at Ipswich. The drawings of the plants for the woodcuts of both Supplements have been made by J. D. C. Sowerby, Esq., F.L.S.

The First Additional Supplement was prepared by my late husband; and in the present one I have endeavoured, as closely as possible, to follow the same plan. As, however, the publication of this Second Additional Supplement was unavoidably delayed from the difficulty of finding living specimens or dried plants, to serve as copy for some of the woodcuts, I have, assisted by Mr. Wooster, added an Appendix containing the most important of the plants which have been introduced since the letterpress of the Supplement was completed. In preparing this Appendix I have been greatly indebted to the Bon Jardinier for the present year, published by M. Louis Vilmorin, of Paris; and to Messrs. Veitch, of Exeter, whose very able collector, Mr. Lobв, has introduced so many new and valuable plants.

Bayswater, April, 1855.
J. W. L.
$\sigma$ To indicate when a reference to the Supplement is necessary, a cross $(+)$ is placed in the body of the work before such genera as are divided or repeated, and also in those places where new genera should have come in; and a § before such species as have some further information given respecting them in the Supplement.

# RULES FOR PRONOUNCING BOTANICAL NAMES. 

## syllables.

In classical words there are as many syllables as there are vowels; except when $u$ with any other vowel follows $g, q$, or $s$, and when two vowels unite to form a diphthong. The diphthongs are $a, \alpha, a i, e i, a i, u i, a u$, $e u$, and ou. These seldom coalesce in final syllables; $00, e e, e a$, and other combinations which never occur as diphthongs in classical words, follow, in commemorative names, the pronunciation of their primitives, as Teédia, Woódsia.

## vowels.

In this work the accented vowels are indicated by the mark placed over each; but as this only points out the vowel on which the stress is laid, the following observations will be found useful in showing when the vowel is to be sounded long, and when short. In addition to the primary accent, every word of more than three syllables contains a secondary accent, which is regulated by the same rules. The secondary accent must always be at least two syllables before the primary accent, as in Chelidonium; for its place the ear is a sufficient guide, and even were it entirely omitted, still, however inharmonious, it would not be incorrect.
Every accented penultimate vowel is pronounced long, when followed by a vowel or a single consonant, as Achiliè $a$ tomentùsa; but it is shortened when followed by two consonants or a double one, as $S$ órbus, $T$ áxus; except when the first consonant is a mute and the second a liquid, as A 'brus.

Every accented antepenultimate vowel, except $u$, is pronounced short, as Helléborus, Humulus; but when succeeded by a single consonant, followed by $e$ or $i$ and another vowel, it is lengthened, as Stellaria; except $i$, which is short, as Tilia.
$A$ unaccented, ending a word, is pronounced like the interjection $a h$, as Sticta ( $a h$ ).
$E$ final, with or without a consonant preceding, always forms a distinct syllable, as Silènë, $A^{\prime}$ loë; also when the vowel is followed by a final consonant as Tri-cho-ma-nes, not Tri-cho-manes.
$I$ unaccented, if final, sounds as if written eye, as Spica vénti (eye); but, when it ends a syllable not final, it has the sound of $e$, as Méspilus (Mespelus), Smithii (Smithë-eye).
$Y$ is subject to the same rules as $i$.
The diphthongs $a$ and $a$ conform to the rules for $e ; e i$ is generally pronounced like eye; the other diphthongs have the common English sounds.

## CONSONANTS.

$C$ and $g$ are hard before $a, o$, and $u$, as Córnus, Gàlium ; soft before $e, i$, and $y$, as Cetrària, Citrus.
$T, s$, and $c$, before $i a, i e, i t, i o, i u$, and $e u$, when preceded by the accent, change their sounds, $t$ and $c$, into $s h$, as Bletia, Vicia; and $s$ into $z h$, as Blasia: but, when the accent is on the first diphthongal vowel, the preceding consonant preserves its sound, as aurantiacum.
$C h$, before a vowel, is pronounced like $k$, as Chelidonium (kel), Colchicum (kolkekum); but in commemorative names it follows their primitives, as Richardsonia, in which the ch is soft.
$\mathrm{Cm}, \mathrm{cn}, \mathrm{ct}, \mathrm{gm}, \mathrm{gn}, \mathrm{mn}, \mathrm{tm}, p s, p t$, and other uncombinable consonants, when they begin a word, are pro. nounced with the first letter mute, as Ptèris (teris), Cnicus (nikus), Gmelina (melina), Gnidia (nidia); in the middle of a word they separate as in English, as Lap-sàna, Lém-na.
$P h$, followed by a mute, is not sounded; but, followed by a vowel or a liquid, sounds like $f$, as $P$ hlèum (fleum).
${ }_{S} c h$ sounds like $s k$, as $S$ chœ'nus (skenus); in $t l$ and $\pi m$ both letters are heard.
$S$, at the end of a word, has its pure hissing sound, as Dáctylis ; except when preceded by $e, r$, or $n$, when it sounds like $z$, as $R$ ibes (ezz).
$\boldsymbol{X}$, at the beginning of a word, sounds like $z$, as Xảnthium; in any other situation it retains its own sound, as Taxus, Tamarix. (Extracter from the Gardener's Magaxine, vol, v. p. 232.)

## GENERAL INTRODUCTION.

The science of Botany consists of two departments, Phytology and Physiology. This Encyclopædia is exclusively devoted to the former department, and it is limited to the plants in Britain, indigenous and exotic.

Phytology, or the History of Plants, comprehends the knowledge of the external parts of plants, the determination of their names, their classification, their uses, their individual history, and their geography. The object of this work is to convey, in the most convenient manner and in the least possible space, a knowledge of the various particulars which arrange themselves under these heads.

A knowledge of the external parts of plants will be readily and agreeably obtained by turning over the first 700 pages of this work at random, looking at the engravings, and comparing them with the names and descriptions to which they refer; the same process will enable the reader to recognise, at sight, the 10,000 species figured in the 700 pages. In this way, botanical figures supply the place of a botanical garden; and the beginner learns the natures, the technology, and the general appearances of plants, almost as easily and naturally in the one case as he does in the other.

To determine the name of an unknown plant, it is necessary to be furnished with a specimen of it in flower. The parts of the plant including those of the flower being already known by the process above mentioned, its class will be ascertained by the Table of the Linnean System (p. 2.), and its order, genus, species, \&c., by turning to the page referred to at the end of the class. Thus, if you hold in your hand a specimen of Phillyrèa angustifòlia in flower, on counting the stamens and pistils you find it belongs to Class II. Order 1., from which, in the Table in p. 2., you are referred to the details of the class in p. 8.; you there find, under Order 1., the characters of all the genera of that order, and that the flower which you hold in your hand best agrees with the definition given of the genus Phillyrèa, No. 33. But you wish to know the species; and, Phillyrèa being No. 33., you turn to that number in the details of the genera in the subsequent pages. After comparing its leaves with the specific character given of the different species, you find it best agrees with $P$. angustifolia; and, finding this species numbered 143., you look for that number in the two plates of engravings in the lower parts of the pages, and find a figure which confirms your decision. By reading the abridgements in the line which follows the word angustifollia, together with the note to the generic name Phillyrèa at the bottom of the page, you find in an abridged form its English name, habit, habitation in the garden, popular character, the height to which it grows, its time of flowering, the colour of its flower, its native country, the year of its introduction into Britain, its propagation, the soil in which it grows, a reference to a work where it is figured and described at greater length, and its uses in the arts, or whatever else is remarkable in its history. You find, also, the natural order to which the genus belongs, the etymology of the name, the French or German name, if the plant has a vernacular name in these languages, and, both generic and specific names being accentuated, you have the pronunciation. On turning to the Table of Synonymous Names (p. 1108.), you will find its vernacular name in the languages of the countries where it is common. If it is not so common in any country as to have received a vernacular name, it will not be found in that list. Finally, if you should not understand any of the terms used in the definition of the specific characters or in the notes, on turning to the Glossary (p. 1094.) you will find them explained, and illustrated where necessary by engravings.

When the beginner has a leaf or any part of a plant not in flower, he may ascertain, by turning to the Introduction to the Natural System (p. 1051.), to which of the three grand divisions of the vegetable kingdom it belongs, and may learn other particulars, according to circumstances which it is unnecessary to detail. Without the flower, he will not be able by the Natural System to determine the name of a plant; but, what is often much more important, with a very small portion of any part of a plant he will be able to discover some thing of its nature, an advantage which does not belong to the System of Linnæus.

The classification or arrangement of plants is made by botanists with a view to two objects: the first, to facilitate the discovery of their names, and thus to know them individually; the second, to give general ideas respecting their natures, and thus to know them as belonging to large masses or groups. Hitherto, no system has been discovered which has attained both these objects in an equal degree of perfection; but the Linnean Arrangement has made the greatest advances in teaching how to discover the names of plants, and the Jussieuean in teaching us their natures, and how to recognise them as belonging to certain masses or groups. In order that the student may acquire both these kinds of knowledge, we have given both arrangements. We have begun with the Linnean, not only as being best adapted for beginners, but because it is necessary to know how to discover the name of a plant, as well as to be able practically to recognise a number of plants, before attempting to know their natures, or to combine them in masses or groups.
"The standing objection to botany," says White of Selbourne, "has always been, that it is a pursuit that amuses the fancy and exercises the memory without improving the mind or advancing any real knowledge; and where the science is carried no farther than a mere systematic classification, the charge is but too true. But the botanist, who is desirous of wiping off this aspersion, should be by no means content with a list of names; he should study plants philosophically, - should investigate the laws of vegetation, - should examine the powers and virtues of efficacious herbs, - should promote their cultivation, and graft the gardener, the planter, and the husbandman, on the phytologist: not that system is by any means to be thrown aside; without system the field of nature would be a pathless wilderness ; but system should be subservient to, not the main object of, our pursuit."
"After all that has been effected, or is likely to be accomplished hereafter," Professor Lindley observes, "there will always be more difficulty in acquiring a knowledge of the Natural System of Botany than of the Linnean. The latter skims only the surface of things, and leaves the student in the fancied possession of a sort of information which it is easy enough to obtain, but which is of little value when acquired; the former requires a minute investigation of every part and every property known to exist in plants, but when understood has conveyed to the mind a store of information, of the utmost use to man, in every station of life. Whatever the difficulties may be of becoming acquainted with plants according to this method, they are inseparable from botany, which cannot be usefully studied without encountering them." *

The History of Plants comprehends every thing relating to their use in the arts, or in any way as connected with man, with animals, or with civilisation. The Geography of Plants relates to the countries in which they are indigenous or acclimated, and to the soils and situations in which they grow or may be grown. Every thing essential in relation to these points will, as we have already stated, be found after the name of each species in the text, after the name of the genus in the notes below, under the natural order to which the genus belongs in the Natural Arrangement (Part II. p. 1051.), in the Table of Synonymes (p. 1108.), or in the Glossary (p. 1094.).

The General Index (p. 1143.) contains not only the names of the genera, and of the classes and orders of both systems, but those of all the remarkable species, and the more important systematic and British synonymes both of genera and species. The various names being included in the same alphabet, this Index may therefore be consulted as a Dictionary of Plants.

[^1]
## THE

# ENCYCLOPEDIA OF PLANTS. 

## PART I.

LINNEAN ARRANGEMENT.

THE main object of the artificial system of botanical arrangement is to facilitate the discovery of the names of plants. For this purpose some one organ, common to plants in general, is fixed on; and, according to certain conditions in which this organ is found, individual species are referred to their places in the system, as words, by their initial letters, are referred to their places in an alphabetical dictionary.

In the progress of artificial systems different organs have been fixed on by different botanists; but those which have been most extensively employed are the corollas by Tournefort, and the stamens and pistils, by Linnæus. The system of Tournefort has been a good deal employed in France, and may be considered as the artificial system of that country; that of Linnæus has been employed in most other countries, and is justly esteemed by far the most perfect artificial system which has hitherto been produced. It is, therefore, adopted in this work.

The application of the Linnean system in practice, Sir J. E. Smith observes, is, above all other systems, easy and intelligible. Even in pursuing the study of the natural aftinities of plants, this botanist aftirms " that it would be as idle to lay aside the continual use of the Linnean system, as it would be for philologists and logicians to slight the convenience, and indeed necessity, of the alphabet, and to substitute the Chinese character in its stead." (Introduct. to Bot.) "The student of the Linnean artificial system," he elsewhere observes, "will soon perceive that it is to be understood merely as a dictionary, to make out any plant that may fall in his way." (Gram. of Bot.) "If we examine," says Decandolle, "the artificial systems which have been hitherto devised, we shall find the most celebrated of them, that which was proposed by Linnæus, to possess a decided superiority over all others, not only because it is consistently derived from one simple principle, but also because the author of it, by means of a new nomenclature, has given to his terms the greatest distinctness of meaning." (Elements of the Philos. of Plants, by Decandolle and Sprengel.) Whether or not subsequent advances in science may enable botanists to dispense with the Linnean system altogether, it is not for us to affirm; but in the meantime nothing can be more certain than that the Linnean system is the best leading arrangement for such a work as the present, in the existing state of botanical knowledge in Britain.*

According to the Linnean system all plants are furnished with flowers, either conspicuous or inconspicuous. The plants with conspicuous flowers are arranged according to the number and position of their stamens and pistils ; those with inconspicuous flowers are arranged according to the situation of the flowers on the plant, or according to other circumstances in the plant itself.

To discover the name of a plant by the Linnean system, therefore, all that is necessary for a beginner is to possess a specimen of it in flower, and to be able to know its different parts by the names given them by botanists. To discover the class, order, and genus of a plant, it is only necessary to be able to distinguish and name the different parts of the flower. These parts are: the calyx or cup (fig 1. a), which is that leaf, or those leaves, by which the flower is usually enclosed when in a bud, and which, when the flower is expanded, appear under it. The corolla (corona, a crown) is the coloured leaf, or leaves, of a flower (fig. 1. b). The stamen (or first principle of any thing) is the thread-like process, or processes, immediately within the leaves of the corolla (fg. 2.) : it consists of two parts, the filament or thread ( $a$ ), and the anther ( $b$ ); this anther contains what is called the pollen, or fructifying meal (c). In the centre of the flower is the pistil (fig. 3.): it consists of three parts, the germen, or rudiments of the fruit or seed (a), the style (b), and the stigma or summit(c), which crowns the style, and is destined to receive the fructifying pollen.
The pistil and stamen are the essential parts of a flower. The corolla or the calyx may be wanting, and yet the flower will be termed perfect, because the absence of those parts is no obstacle to reproduction. Even the style and the filament may be absent without preventing the formation or ripening of the fruit; and there are many flowers which have the anther sitting close to the corolia, \&c., without a filament, and the stigma to the germen without a style; but the
 anther, the germen, and the stigma are essential.

The seed is contained in the pericarp, or seed-vessel, which is the germen when grown to maturity. The name of seed-vessel varies according to its form, substance, \&c.; but the word pericarp (peri, about, karpon, a fruit) is applicable to all its varieties. The receptacle is the base or medium which connects the orher parts of the fructification. (Magaxine of Natural History, vol, i. p. 233.)

The degree of knowledge conveyed by the following Table, and the preceding observations, will enable a beginner to discover the class, order, and genus of any plant which he may find in flower.

[^2]Frast Grand Division. - Plants with conspicuous Flowers (Phanerogàmia).

Second Grand Division. - Plants with inconspicuous Flowers (Cryptogìmia).
11. Gonoptérides (gonos, seed, pteris, fern), Stachyopterides (stachys, a spike, pteris, fern), Poropopterides (paros, a pore, pteris, fern), F1lices (filix,

To discover the particular species or variety of a plant it is necessary to become acquainted with the forms and different conditions of the leaves, stems, and other parts of the bodies of plants, as well as with their flowers, and this knowledge, as we have before stated ( $p . x i x$.), will be obtained with the greatest facility by turning to the Glossary (p.1094.), and comparing the definitions with the engraved figures.

## Class I. - MONA NDRIA. I Stamen.

This class, which is not large, contains chiefly exotic plants, and of these the tribe of Scitamineæ is considered one of the most beautiful families of the vegetable kingdom. The useful productions are chiefly the Ginger, Cardamom, and Turmerick, spices highly esteemed, and in general use wherever they are known, and can be procured. The Salicornia, a native of our sea-shores, is burned for kelp, and pickled for culinary purposes. Almost all the plants of this class are aquatics, or grow in marshes. They chiefly thrive best in a sandy loam, from which their roots should be well cleaned every year.
The genera of the Scitamineæ and Canneæ have been remodelled by Roscoe, whose arrangement has received considerable improvement from the hand of the late Dr. Roxburgh. The nature of the floral envelope of those plants has long been a subject of dispute among botanists, some considering the colored inner segments to be true petals and to be variable in numbers; and others, supposing them to be part of the calyx and constant in number, their occasional variation in number being capable of explanation. Persoon (Synopsis, p. 1.) is of opinion that many of the genera of the first section ought to be referred to Gynandria. According to Willdenow and others, the following species belonging to other classes have only one stamen.
Monogynia. Mangifera indica; Alchemilla aphanes, several species of Scirpus, Cyperus, Schœenus, Kyllinga, Cryptostomum monandrum, Chorizandra, Yolycnemum monandrum, Hopea.
Digynia. Lacistema, Leersia, Salsola, and many grasses.
Order 1. MONOGYNIA.
1 Stamen. 1 Style.

## § 1. Germen inferior, anther simple, style erect, free. Flowers spathaceous.

1. Canna. Anther attached to the edge of the petal-like filament. Style thick, club-shaped. Stigma linear, obtuse.
2. Maranta. Anther attached to the petal-like filament. Style petal-shaped. Stigma three-sided. Flowers panicled.
3. Calathea. Anther attached to the petal-like filament. Style petal-shaped. Stigma cucullate. Flowers in close heads.
4. Thalia. Anther attached to its proper filament. Style depressed. Stigma depressed, perforated, and gaping.
5. Phrynium. Anther attached to its proper filament. Style united to the tube of the corolia, hooked at the end. Stigma funnel-shaped. Seeds with an arillus.
6 2. Germen inferior, anther double, style inclosed in the furrow formed by the anther. Flowers spathaceous
6. Hedychium. Anther naked. Tube of the corolla long and slender, with both limbs 3-partite, the interior one resupinate. Capsule dry.
7. Roscoea. Anther 2-lobed, incurved, surrounding the style with an appendage split at the base. Outer limb of the corolla 3-partite, with the upper segment erect and fornicate. Inner limb 2lipped.
8. Alpinia. Anther not crowned. Interior limb of the corolla with one lip. Capsule berried. Seeds with an arillus.
9. Hellenia. Anther in some marginal. Filament linear, longer than the anther, with a very short rounded entire or cilobed appendage. Capsules crustaceous. Seeds with an arillus,
10. Zingiber. Inner limb of the corolla with one lip. Anther with a simple recurved horn at the end,
11. Costus. Interior limb of the corolla nearly campanulate, split at the back. Filament lanceolate, Anther in the centre of it or at some distance from the end. Seeds naked.
12. Kampferia. Tube of the corolla long and slender, with both limbs 3 -partite. Anther with a 2 -lobed crest.
13. Amomum. Inner limb of the corl. with 1 lip. Anther with an entire or 2-lobed crest. Seeds with an arillus.
14. Curcuma. Both limbs of the corolla 3-partite. Anther with two spurs at the base. Seeds with an arillus.
15. Globba. Inner limb of the corolla 2-lobed or none. Filament hollow at the base, with a wedge-shaped lip Anther with an appendage or none. Seeds attached to 3 parietal placentas.
16. Mantisia. Outer limb of the corolla 3-partite, inner filiform with a double trifid limb. Filament 4-partite at the end.

## §3. Germen superior, corolla irregular.

17. Philydrum. Calyx 2-leaved colored. Filaments 3 united at the base, the two lateral ones barren and petal-shaped. Seeds numerous, minute.
§4. Germen inferior, corolla irregular. Flowers naked.
18. Lopezia. Cal. 4-leaved. Cor. 4-petaled, unequal. Filaments two: one antheriferous, the other petalshaped abortive. Caps. 4-valved, 4-celled, many seeded.

## 8. Germen inferior, corolla regular, flowers naked.

10. Boerhaavia. Cal. 1-leaved, ob-conic, inclosing the seed. Cor. plaited, on the end of the calyx.
11. Centranthus. Cor. 5-lobed, regular, spurred. Caps. 1-celled, crowned with the limb of the calyx expanded into a plumose pappus.

## § 6. Apetalous.

21. Pollichia. Cal 1-leaved, 5-toothed. Seed 1. Fruit upon the heaped, berried scales of the receptacle.
22. Salicornia. Cal. turbinate, entire, fleshy. Stamen inserted into the bottom of the cal. Style 2-fid,

Utricle inclosed in the fleshy calyx. Seed vertically compressed.
23. Hippuris. Cal. entire, minute. Style in the hollow of the anther. Germen inferior, one-seeded, crowned by the rim of the calyx.
24. Zostera. Spadix linear in the sheath of the leaf, bearing seed on one side. Stamens opposite the germens and alternate with them, sessile. Caps. one-seeded.
25. Chloranthus. Stamen irregular, fleshy, lobed, fixed to the side of the germen. Stigma capitate. A drupa.

Order 2. DIGYNIA.
1 Stamen, 2 Styles.
26. Corispermum. Cal. 2.leaved. Cor. O. Seed one, oval, convex-plane. (Stamens often 5.)
27. Callitriche. Cal. 2-leaved. Pet. O. Caps. 2-celled, 4-seeded.
28. Blitum. Cal. trifid. Cor. O. Seed one, immersed in a berried calyx.
29. Aspicarpa. Cal. 5-parted. Cor. O. Stamen included. Germen and Stigma 2-lobed. Fruit cartilagi. nous, 1-seeded.

History，Use，Propagatzon，Culture，
1．Canna．From a Celtic word signifying a cane or mat．Le Balisier，Fr．Blumenrohr，Ger．Canna，Ital． The first three species are found wild within the tropics on all the continents，and chiefly in moist woods，or spongy woody wastes ：in America and the Brazils，they are known by the name of wild plantain，and their leaves are used as envelopes for many objects of commerce；from which circumstance，the French name of the plant（balisier）is said to have arisen；balija being Spanish for an envelope．Clusius says he saw the C．Iutea rosaries：in the East Indies the seeds are somet，and that the inhabitants there use the seed for making their rosaries：in the East Indies the seeds are sometimes used as shot．The roots of C．edulis are eaten，dressed in various ways，in Peru．The seeds of most of the species are round，hard，black，shining，heavy，and about one sixteenth of an inch diameter．These grow readily，or the plants may be propagated by dividing the roots；Miller recommends rich garden earth；Sweet（Bot．Cultiv．p．34．）light rich soil for all the species．Most these，if planted in a warm border early in summer，will Hower there during the season．
2．Maranta．So named from Bartholomeo Maranti，a Venetian physician，who wrote three books chiefly to illustrate Diosc．；died 1554．Galangre，Fr．Galgant，Ger．The M．arundinacea is called Indian arrow－ront because its thick fleshy root was thought to extract the poison from wounds inflicted by the poisoned arrows of the Indians．In the West Indies it is used as an alexipharmic，to resist the force of poisons：

Essential spectic Character.
1 Inner limb of the corolla 3-fid, Seg. ovate equal sprdg. with long claws, Lip bifid, rev. Leaves ovate lane 2 Inner limb of the corolla trifid, Segments lanceolate acuminate straight
3 Inner limb of the corolla trifid, Segments straight emarginate
4 Inner limb of the corolla bifid
5 Peduncle short inclosed in the upper leaf, Inner limb of the corolla trifid, Segments ovate lanceolate suberect, Lip erect spreading entire
6 Peduncles elong. Inner limb of corolla 3fid, Seg. Janccol. spathul. reflexed spreading, Lip oblong entire
7 Segments of cor. 2 entire ovate unequal, Lip bifid bent down
8 Segments of cor. 3 broad emarginate and crenate : the claws long, Lip. 2 -fid bent down
9 Leaves of cal. lanceolate acute, Cor. 5 parted, Leaves ovate obl. acute at both ends cordate
10 Leaves of cal, oblong obtuse, Cor. 6 parted, Leaves ovate-obl. acute at both ends cordate
11 Leaves sessile ovate with the sheaths and nerves very red, Inner limb 4 parted
12 Leaves smooth and stems colored at the base, Roots tuberous and large, Middle seg. of corolla very short
3 Flowers sessile in pairs, Segrnents of cor. 2 erect bifid, Lip spotted revolute
4 Flowers on stalks: outer segments reflexed, inner 3 erect, Leaves lanceolate pointed at each end
5 Inner limb of the corolla trifid, Segments flaccid
16 Inner limb of the corolla trifid, Segments ovate straight, Lip three-lobed fringea
17 Stem and Leaves beneath downy, sheaths curled and colored at the edge, Flowers cernuous
18 Culm branched herbaceous, Leaves ovate lanceolate somewhat hairy underneath
19 Leaves ellipt. oblique at end, Spikes elong. in fasc. Bract. erect, 2 -fid. imbricate acute pubesc.
20 Culm branched knotty ovate smooth, Spikes terminal subternate, Bracteas colored
21 Stem knotty, Leaves lanc. narrow, Panicle wavy, Inner braits colored, Calyx ovate
22 Stem shrubby branching, Leaves ovate smooth
23 Leaves oblong lanc. pubesc. F1, stalks 2 -fid. Germ very hairy
24 Stemless, Scape naked, Spikes comose, Bracteas reflexed
25 Flowers in dense heads shorter than the leaves which are striped with purple

26 Calyx two-flowered, Culm reedy powdered, Leaves ovate revolute at the apex

## 27 Stemless, Leaves radical

28 Shrubby, dichotomous, Leaves cordate
29 Leaves lanceolate, Spikes compact imbricated, Segments of the cleft lip of the corolla lunulate 30 Leaves linear lanc. Spikes open, Fasc. of flowers subtern. Seg. of cleft lip obl. the other 5 segs. of cor lin. 31 Leaves obl. lanc. smooth, Spikes loose, Fascic. tern. 3 Ad. Inner segs. of the cor. linear-cuneate, Lip bifid 32 Spike many-fl. loose, Fascicles many-f. distant, Lip obovate bifid, Filament colored longer than corolla 33 Leaves lanceolate, Spike loose ovate, Petals linear, Lip ovate 2 -lob. Fil. the same length as petals
34 Spathes truncate 1 -fl. Outer segments of cor. linear, Lip roundish 2-lobed longer than the style

## and Miscellancous Particuldrs.

washed, pounded, and blanched, it makes a fine powder and starch, and may be used as food, resembling in many respects the salep. A light loamy soil suits all the species, which, though tender, are readily propa-
gated by dividing the root.
3. Calathea. So named by Meyer, probably from the cup-like stigma of the genus. It is much admired on account of its singularly striped foliage, to which the specific name alludes, and its ovate spike of purple flow ers, about the size of a large pine cone.
4. Thalia. In memory of John Thalius, a German physician, at Nordhuys, author of Plantæ Hercynæ, 1588. An aquatic, and if planted two or three feet under water, will survive our winters, in the open air. It flowers beautifully.
5. Phrynium. Фevuov, a plant which grows in marshes, the habitation of frogs, from фeuvos, a frog. The leaves are used in Malabar and China, for wrapping up cakes in the oven; before expansion they infuse them in spirit of rice or sugar diluted with three times its quantity of water, to make vinegar. Loureiro.
6. Hedychium. From a Greek word signifying sweet, from the grateful odour it emits. This beautiful genus requires a light rich soil, and large pots to make the plants flower freely. H. angustifolium deserves a place in every collection.

History, Use, Propagation, Culture,
7. Roscoea. Named by Sir J. E. Smith, in honour of W. Roscoe, Esq., the accomplished historian of the Medicis, and the first botanist who elucidated the plants of the order Scitamineæ. The species are little known, but are both beautiful and curious.
8. Alpinia. After Prosper Alpini, an Italian physician and botanist, who practised at Cairo between 1580 and 1584, and died in 1615. Canne de Riviere, Fr. A splendid genus, requiring rich soil, a moist heat, and plenty of room. A. racemosa answers best when treated as an aquatic.
9. Hellenia. In honour of C. N. Hellenius, Professor at Abo, who, in 1798, published several academical diso sertations. The same culture answers this plant as recommended for Hedychium.
10. Zingiber. From the original Indian appellation. Zingembre, Fr. Ginfer, Ger.; and Zinzer, Ital. Many of the specific names employed in the genus are derived from the vernacular names of the species. The roots of Z. officinale, and zerumbet, much used in the kitchen and in medicine, form a considerable export from our West India Islands. As a medicine, ginger is particularly useful in flatulent colic, debility, and laxity of the system, and in torpid and phlegmatic constitutions, to excite a brisker action of the vessels. The roots of ginger are taken up when the stalks fade, and, being first washed and scalded, are afterwards dried in the sun. This forns black ginger; the white sort is never scalded, but only washed and dried. When the root is to be

38 Flowers large terminal in the sheaths of the top of the stem, Leaves oll. acute sm.
39 Spike terminal comose, Bracteas colored longer than the flowers, Leaves oblong-ovate pubescent

71 Leaves orbiculate ovate wavy woolly beneath
72 Leaves oval, Spike central, Anther crest jagged
73 Scape very short, Flowers heaped, Leaves distant ovate acum. entire smooth
74 Scape short, Flowers numerous close, Sterile stem simple, Leaves ellipt. lanc. pointed
75 Scape naked very short, Spike capitate, Leaves linear lanceolate
76 Scape branching lax, Leaves ovate
77 Leaves broad villous beneath, Spikes radical, Lip round oval, Crest broad truncated, Caps. 9 wingeh
78 Scape naked, Spike elong. Bract. inflated, Leaves broad lanceol.

and Miscellaneous Particulars.
preserved in syrup, it is taken up and scalded before fully grown. After steeping and washing in water, it is put in jars, and covered with a thin syrup. (Browne's Jamaica.)
and fomentations, but not as internal medicine. 11. Costus. From its name in Arabic, gosth. Jacquin has shewn that the costus of the moderns is not the same as the plant so called by the ancients. Costwurtz, Ger., and costo, Ital. All the species grow in woods in their native countries, and their roots partake somewhat of the qualities of ginger.
12. Kampferia. In honor of Engelbert Kæmpfer, the Japanese traveller ; born in Lemgow in Westphalia in

1651; died in 1716. Zedoaire, Fr. and Grosse Galgant, Ger. This a curious genus of low stemless plants, with tuberous roots, a pleasant aromatic smell, and sharpish taste. The root is purple without and white within, and is esteemed a stomachic and cephalic. When the plants are not in a growing state, they require little or no water ; otherwise like bulbs which are kept always moist, they will not flower freely.
13. Amomum. From $\alpha$, privative, and uw $o \frac{1}{}$, impurity, it has always been esteemed a powerful counter poison; or perhaps a corruption of phamâmâ, the Arabic appellation of the plant. L'amome des pedes, Fr. Ingwer and Gengiovo, Ital. Most of the species formerly included under this genus are placed by Roscoe under
Zingiber.

History, Use, Propagation, Culture,
14. Curcuma. From the Arabic lourkum or hercum. Babilonischer safran, Ger. C. longa was formerly much used in cookery to give things a color, and is still so used in the East Indies, for dyeing. The root was reputed aperient and resolvent, and was given in jaundice: it tinges the urine of a deep yellow. The roots of C. zerumbet powdered and mixed with the powdered wood of Cæsalpinia Sappan is copiously thrown about by the Hindoos during their holidays in March. The tubers of many species yield a very beautiful pure starch like arrowroot, which in some places, especially Travancore, forms a large part of the diet of the inhabitants.
15. Globbar. Its Indian name, and that also by which it is known in the Moluccas. Globée, Fr. Most of the species produce spikes of smoky-colored berries about the size of grapes, and which are sometimes eaten.
16. Mantisia. The flowers bear a singular resemblance to some of the insects called mantis, The name of the species is derived from a fanciful notion that the flowers are like a dancing figure attached to a wire,
17. Philydrum. $\Phi$ ios and viowg, a lover of water, in allusion to the places in which it grows. A pretty biemmal plant, requiring but little protection from frost.
18. Lopezia. Dedicated by Cavanilles to the memory of the licentiate Thomas Lopez, a Spanish botanist, who is said to have directed his attention to the natural history of the New World. The species are chiefly clegant annuals, and well deserving of cultivation.
19. Rourhaduia. So named in honor of the famous Boerhave of Leyden, born at Voorhoot in 1608, and died

80 Spikes lateral, Bulbs small with long palm. tub. yell. inside, Leaves brond sessile silky beneath all green 81 Spikes lat. Tub. palm. pale straw-col. 85 Spikes lateral clavate comose, Roots ovate pale yell. inside, Leaves all green
86 Spikes lateral, Tubers large incurved pale yellow, Leaves sessile villous beneath all green
87 Spikes lat. Roots palm. scented pale yell. inside palmd. Leaves and sheath rusty with a pale red spot in mid.
88 Spikes lat. few-flowered comose, Tubers long spreading pale inside, Leaves smooth pure green
89 Spikes lat. Tubers all yellow, Leaves sessile green broad with a purple cloud down the middle
90 Spikes lat. Leaves stalked oblong with red sheaths
91 Spikes lat. Root with pale pendulous tubers, Leaves stalked narrow, Flowers longer than bractes
92 Spikes central, Tubers palmate deep yellow, Leaves long stalked broad-lanceolate, Plant all green
93 Spikes central, Leaves on long stalks cordate, Coma lilac
94 Spikes central few-flowered, Tubers palmate pale yellow inside, Leaves broad smooth on long stalks
95 Spikes central, Roots deep orange inside, Leaves long stalked broad green
96 Leaves lanceolate, Spike terminal sub-sessile cone-shaped bulbiferous, Anther 4-horned
97 Spike whorled, Lateral segments of cor. longest, Appendage cordate, Bractes lanc. withering, Bulbiferous 98 Leaves ovate lanc. villous beneath, Racemes compound term. bulbif. Anther naked roundish

99 The only species
100 Flowers bright yellow, Leaves hairy
101 Leaves ovate villous, Stem round
102 Leaves ovate attenuate at base, with the 4-cornered stem smooth
103 Leaves shining, Stems angular, from the decurrent stalks, Corymbs leafy at the base
104 Leaves roundish cordate ciliated smooth, Branches angular
105 Stem 4-cornered smooth, Joints clammy, Flowers panicled, Leaves angular dotted with black beneath
106 Stem round pubescent, Flowers in capitate corymbs
107 Stern roundish hairy, Leaves ovate acute sub-repand, Flowers in heads diandrous
108 Stem climbing, Leaves all cordate, Flowers in umbels diandrous
109 Villous viscid, Leaves ovate acute sub-repand, Stem procumbent, Flowers in heads triandrous
110 Leaves entire lanceolate, Stem $\frac{1}{2}$-shrubby at base, Flowers corymbose, Stamens nearly twice as long as cor.
111 Leaves linear, Stem herbaceous, Flowers corymbose, Stamens nearly thrice as long as corolla
112 Rad. leaves ovate cauline pinnatifid, Stem upright smooth, Flowers panicled
113 Stems branching declining, Flowers minute sessile in axillary heads
114 Leaves alternate sheathing obtuse gaping on one side
115 Stem erect shrubby, Joints of the young branches 2 -sided, Scales of flowers truncate membranous
116 Stem shrubly procumb. rooting, Joints compressed emarg. cylindr. Spikes obl. Style deeply divided, Stam. 2
117 Herbaceous spreading, Joints emarginate compressed at end, Spikes axillary opp. stalked, Scales blunt
118 Herbaceous procumbent, Joints obconic, Branches simp. Spikes fastigiate, Stamens 2
119 Leaves whorled $10-12$ linear acute

m 1758. La Tassole, Fr. He was the first friend and protector of Linnæus. All the plants of this genus are possessed of little beauty.
20. Centranthus. From zevтeav, a spur, and $\alpha$. $9 \circ 5$, a flower, in allusion to the calcarate corolla.
21. Pollichia. In honor of Jean Ad. Pollich, a German botanist, who published in 1776, a history of the plants of the Palatinate. The only species is an obscure herbaceous piant.
22. Salicornia. From sal, salt, and cornu, a horn; saltwort, marsh samphire. Le Christemarine, Fr. Glass schmaltz, Ger., and Erba-cali, Ital. S. herbacea is gathered when in flower, and pickled in salt and vinegar like samphire, for culinary purposes. The whole plant has a saltish taste, and is greedily devoured by cattle. All the species, excepting the S. arabica, abound on the shores of the Mediterranean, and are there burnt for soda, which is much used in the manufactures of soap and glass, especially at Marseilles.
23. Hippuris. From izsos, a horse, and é $\boldsymbol{c}^{\alpha}$, a tail. La Pesse d'eau, or pin aquatic, Fr. Schaftholm, Ger., and Hippuride, Ital. The flower of this plant is one of the simplest among perfect plants; it has only one stamen and one pistil, unprotected by either calyx or corolla, and it produces only one seed. The situation of the leaves in whorls is not usual in European plants, excepting in the stellatæ of Linnæus. The flowess in the beginning of summer are mostly hermaphrodite, but in autumn many of them are female. By absorbing a great quantity of inflammable air, this plant is reputed to assist in purifying the putrid air of marshes. It is eaten by wild ducks.

History，Use，Propagation，Culture，
24．Zostera．From ${ }^{\text {§uatrng，}}$ ，riband；the leaves of $Z$ ．oceanica are a foot long and an inch broad，resembling a riband．La Zostére，Fr．，and Seetang，Ger．This plant abounds on the coast of Yarmouth，where it is thrown on shore in such abundance that mounds are made with it to enclose the encroachments of the sea． It is also used as thatch，and said to endure for upwards of a century；by exposure it bleaches white．In Sweden and Holland it is used as a manure，and is preferred to hay for stuffing beds．Horses and swine eat it， but cows are not fond of it．The rush－like envelopes of Italian liquor－flasks are prepared from this plant．
25．Chloranthus．So named from $x^{\lambda \omega}$ ceos，green，and \＆y⿴os，a fower，on account of the greenish hue of its inconspicuous inflorescence．The structure of the flower is very curious，and so anomalous，as to render it diffi－ cult to tell to what class of Linnæus it is referable．For further remarks upon this sulject，see Mr．Lindley＇s Collectanea Botanica，p． 17.
26．Corispermu＾n．From zneцs，a bug or tick，and arєgux，a seed．Le Corrisperme，Fr．，and Der Wansen．

## Class II．－DIANDRIA．\＆Stamens．

This class，which is not large，and so entirely artificial that no other characters than those of the Linnæan definition can be assigned to it，contains some elegant and fragrant plants belonging to Jasminex，Scrophula－ rineæ，and Labiatæ：examples of the two latter orders are Veronica and Salvia，extensive genera chiefly of hardy herbaceous plants．The most useful of the class are the pepper and the olive：the jasmine is used in per－ fumery；the sage and rosemary in cookery；and the privet and syringa for garden hedges．One or two species are employed in medicine；several are border flowers；but the greater number of the class are plants of curiosity．

Codarium is a leguminous plant，and is widely removed from its natural place，which is Diadelpha；so are Salvia，Monarda，Rosmarinus，Veronica，and many others，which would have been naturally referred to Didy namia，

Under this class Persoon has placed the genus Gunnera，which Willdenow injudiciously referred to Gynan－ aria．A great variety of diandrous plants are scattered through the other classes of Linnzus；but as such plants are chiefly，with the exception，perhaps，of grasses，diandrous，on account of the incomplete formation of some of their stamens，the rudiments of which are usually obvious，it is scarcely necessary to particularise more than the following，viz．：－

D．MONOGYNIA．Viola diandra；Saticornia herbacea，virginica；Anychia dichotoma；severa，species of Buerhaavia．D．DIGYNIA．Polyenemum salsum；Bufonia tenuifolia．D．TRIGYNIA．Holosteum diandrum．

125 Spikes axillary, Flowers close imbricat. Leaves nerveless and bractes mucronate pungent
126 Spikes terminal, Flowers becoming remote, Leaves nerveless and bractes pungent, Fruit incurved
127 Spikes terminal and axillary, Flowers imbricate, Leaves and bractes mucronate, Stem villous
128 A small foating plant resembling Lemna

and Miscellaneous Particulars.
same, Ger. The species abound in the south of Russia in marshy steppes with Salsola and Atriplex. Round the Caspian sea they grow six feet high, are red in winter, and eaten by camels.
 trica, Ital. A little aquatic plant, liable to variation in its appearance; on which account some botanists have divided it into several species.
28. Blitum. From $\beta \lambda r$ ov, insipid, or, according to Dr. Theis, from the Celtic blith, which has the same inport. Le Blete, Fr. Die Beermelde, Ger., and Blito, Ital. After the flowers are past, the heads swell to the size of wood-strawberries, and when ripe have the same color and appearance. They are succulent, stain the hands, and were formerly used by cooks for coloring puddings. Some consider the B. virgatum as only a variety of the olier.
29. Aspicarpa. From $\dot{\alpha} \sigma \pi / s$, a round shield, and $\approx \propto \rho \pi \sigma$, fruit, in reference to the form of the ripe fruit.
32. Olea. Cor. 4-cleft. Segments subovate. Drupe one-seeded,
33. Phillyraa. Cor. 4-cleft. Berry one-seeded.
34. Chionanthus, Cor, 4-cleft. Segments very long. Drupe one-seeded, with a furrowed nut
35. Notelcea. Cal, 4-toothed. Cor. 4 short oval petals united by the base of the stamens, Filaments 4-horned. Style O. Stigma bifid. Drupe with a papery putamen.
36. Ligustrum, Cor, 4-cleft. Berry 4-seeded.
37. Syringa. Cor, 4-cleft. Capsule of two cells.
38. Nyctanthes. Cor, 4-cleft. Segments truncated. Caps. with two cells edged. Seeds solitary.
39. Jasminum. Cor. 5 or 8 -cleft. Berry with two divisions. Seeds solitary with an arillus.

## § 2. Flowers complete, inferior, monopetalous, irregular.

40. Veronica. Cor, 4-cleft : limb flattish; the lowest segment the narrowest. Capsule 2-celled.
41. Galipea. Cor 4 or 5-cleft, hypocrateriform. Stam. 4: 2-sterile.
42. Schuenkia. Cor, nearly equal: the orifice plaited, stellate, and glandular. Stam. 5: 3-sterile. Capsule 2 -celled.
43. Gratiola. Cor. 4-cleft, 2-lipped, resupinate. Stamens 4: 2-sterile. Caps. 2celled.
44. Schizanthus. Cal. 5-parted. Cor. 2-lipped resupinate: the upper lip 5-parted, the lower 3-parted. Stam. 4, 2-sterile. Caps. 2valved, 2-celled.
45. Elytraria. Cal, 4-5-parted. Cor. 5-cleft, nearly equal. Caps, 2-valved, 2-celled. Seeds attached below to a dissepiment contrary to the valves.
46. Hypoestes. Cal. 5-cleft equal, with a 4-cleft 3-flowered involucrum. Cor. 2-lipped. Stamens 2. Anthers 1-celled. Seeds fixed by little hooks.
47. Justicia. Cal. 5-parted equal. Cor. 2-lipped or ringent : the lower lip divided. Anthers 2-celled. Seeds attached by little hooks.
48. Dicliptera. Cal. 5-parted, Cor. bilabiate. Caps, with two elastic valves, $\frac{1}{3} 2$-celled, the dissepiment retaining the seeds by its inflexed toothed edge.
49. Eranthemum. Cal. 5-parted. Cor. 5 -cleft, with the tube curved in the middle. Caps. many seeded.
50. Wulfenia. Cor, 4-cleft: smooth bearded. Cal. 5-parted. Caps. 2-celled,
51. Calceolaria. Cor. ringent, inflated. Cal. 4-cleft. Caps. 2-celled, 4-valved.
52. Pinguicula. Cor ringent, spurred. Cal, 5-cleft. Caps. 1-celled.
53. Utricularia. Cor, ringent, spurred. Cal. 2-leaved. Caps. 1-celled.
54. Stachytarpheta. Cal, tubular, 4-toothed. Cor. hypocrateriform, unequal, 5-cleft, curved. Stam. 4: 2 sterile, Seeds two.
55. Lycopus. Cor. 4-cleft, nearly equal, with one segment emarginate. Stamens distant. Seeds naked.
56. Amethystea. Cor. 5-cleft, nearly equal, with the lowest segment concave. Stamens near each other. Seeds naked.
57. Ziziphora. Cal. cylindrical with ten lines, somewhat 2-lipped, 5-toothed, closed with hairs. Cor. 2-lipped. Seeds 4 naked.
58. Cunila. Cal. oblong, 5-toothed, closed with hairs. Cor. 2-lipped. Seeds 4 naked.
59. Hedeoma. Cal. 2-lipped, gibbous at the base. Cor. ringent. Stamens 4:2 sterile.
60. Monarda. Cor, ringent : helmet linear, wrapping up the anthers. Seeds naked.
61. Rosmarinus. Cor. ringent. Helmet arched, bifid. Stamens curved, with a tooth. Seeds naked,
62. Salvia. Cor, ringent. Filaments stalked cross-wise. Seeds naked.
63. Collinsonia. Cor, somewhat ringent: the lip very finely divided. Seeds naked.
64. Catalpa. Cor. 5-cleft, irregular. Cal. 2-parted. Stam. 3 sterile. Caps. 2-celled, Seeds at each end with a. membranous pappus.
65. Ghinia. Cor. ringent. Cal, with 5 bristles. Fruit, a fleshy 4 -celled nut.
§9. Flowers complete, inferior, polypetalous.
66. Fontanesia. Cor. with 2 petals. Cal, 4-parted. Caps, 2-celled, not opening.
67. Linociera. Cor. with 4 petals. Cal. 4 -toothed. Berry with 2 cells.
68. Ancistrum. Cal. 1-leaved, armed with barbed spines, Cor, 4 petals inserted into edge of calyx. Stam. 2-4-5. Stigm. finely divided. Seed one, inclosed in the calyx.

## MONOGYNTA.

History, Use, Propagation, Culture,
30. Codarium. So named by Dr. Afzelius, from жwठoৎov, a leathern pouch, in allusion to the pods of the tree. These are filled with an abundant pithy fæcula, which is eaten by the inhabitants of the coast of Guinea, where the fruit is called wild tamarinds.
31. Maytenus. The barbarous name of the shrub, and applied as a generic name by Molina. It has the habit of a Rhamnus, and will probably form an hardy inhabitant of our gardens.
32. Olea. From $\varepsilon \lambda \propto \iota \alpha$, the Greek name for the plant; a word derived in its turn, as De Théis conjectures, from the Celtic olew, oil. Olea is commonly put for the tree; oliva, for the fruit ; and oleum, for the juice of the fruit. L'olivier, Fr. Ocibaum, Ger., and Ulivo, Ital. The cultivated olive came originally from Asia, and grows abundantly about Aleppo and Lebanon; it is naturalised in different parts of the south of France, Spain, and Italy, and found in hedges and woods; but the fruit of that kind is small and of no use. O. e. var. longifolia, is the variety chiefly cultivated in the south of France and in Italy. O. e. var. latifolia, is chiefly cultivated in Spain; its fruit is near twice the size of the common olive of Provence or Italy, but the oil is so rank of flavor as to be too strong for most English palates. The oil and fruit, in a pickled state, are sent chiefly from Languedoc, Leghorn, and Naples to England; the best oil is from Leghorn, and the best pickles from Genoa and Marseilles. The tree seldom exceeds thirty feet in height, is branchy, glaucous, evergreen ; and of so great longevity, that some plantations in Italy, as at Terni, are supposed to have existed from the time of Pliny. The tree delights in schistous, calcareous steeps, and does not thrive in elevated situations, or at a distance from the sea. The best oil is produced from fruit grown in calcareous soils. Olive oil may be said to form the cream and butter of Spain and Italy; and the tree has been celebrated in all ages as the bounteous gift of heaven, and as the emblem of peace and plenty.

Otive oil is made by crushing the fruit to a paste, then pressing it through a woollen bag, adding hot water as long as any oil is produced. The oil is afterwards skimmed off the water, and put in tubs, barrels, and bottles for use. The best olive oil is of a bright pale-amber color without smell, and bland to the taste. Kept warm, it becomes rancid, and it freezes at $38^{\circ}$ Fah. It is of the same nature with all mild expressed vegetable oils; of these the most fluid are preferred, and hence the oils of olives and almonds are those chiefly used in medicine. Oily substances do not unite with the contents of acid stomachs; but to healthy patients they afford much
69. Ornus. Cal. 4-partel. Cor. of 4 petals. Fruit, a winged Samara of two cells.
§ 10. Flowers complete, superior.
70. Morina. Cal. of the fruit toothed with bristles: of the flower bifid
71. Circea, Cal, 2. leaved. Cor. with two obcordate petals.
72. Fedia. Caps. 3-locular, crowned with the upright (not involute) limb of the calyx. Corolla irregular.
§11. Flowers incomplete, with no corolla.
73. Pimelea. Cal. funnel-shaped, with a 4-cleft limb. Stigma capitate.
74. Cladium. Cal. many-valved, 1-flowered: valves glumaceous, imbricated, the exterior smallest. Nut with a double coat.

Order 2. DIGYNIA.

2 Stamens. 2 Styles.
75. Gunnera. Cor, O. Cal. 2-toothed. Seed one, inclosed in a tough coat.
76. Anthoxanthum. Glume membranous, 3-flowered. Lateral florets neuter with one palea bearded; intermediate floret hermaphrodite, much shorter than the lateral ones. Paleæ obtuse, beardless. Sced free.

Order 3. TRIGYNIA.

2 Stamens. 3 Styles
77. Piper. Cal. O. Cor. O. Berry 1-seeded. Spadix simple, slender, covered with little flower-bearing scales.

MONOGYNIA.
133 Leaves unequally pinnate, Leaflets oval acute the inner the smallest
134 Leaves sessile two inches long opposite or alternate oblong smooth serrated
135 Leaves oblong pointed entire: the young ones only hoary beneath, Branches suiny
1:k Leaves lanceolate pointed entire hoary beneath, Branches angular not spiny
$\beta$ Leaves linear-lanceolate flat silky beneath
$\gamma$ Leaves oblong flat hoary beneath
$\delta$ Leaves narrow acute at each end, rusty beneath
$\varepsilon$ Leaves oblong bent obliquely pale beneath
$\zeta$ Leaves oblong ovate, Branches divaricate
137 Leaves oblong, Flowers racemose panicled terminal
138 Leaves elliptical wavy, Stalks of leaves green
139 Leaves lanceolate flat white beneath, Branches warted
140 Leaves elliptic-lanceolate, Bractes all persistent connate ovate, Racemes sub-compound narrow
141 Leaves elliptic acute, Bractes perfoliate : the lower cup-shaped persistent the upper large leafy deciduous 142 Leaves elliptic-lanceolate sub-serrate, Flowers single lateral in bunches

and Miscellaneous Particulars.
nourishment, and medicinally are supposed to correct acrimony, to lubricate, and relax. Olive oil is applied externally to bites and stings of poisonous animals, and to burns alone, with chalk, or in liniments and poultices. The ancients rubbed their bodies with it in dropsies and for various purposes; but it is now little used excepting for coughs and in worm cases.

Pickled olives are prepared from unripe fruit by repeatedly steeping them in water, to which quicklime or any alkaline substance is sometimes added to shorten the operation. Afterwards they are soaked in pure water, and then taken out and bottled in salt and water, with or without an aromatic. They are eaten abroad as a whet before and during the principal meals, and in this country chiefly at the dessert. They are supposed to excite appetite and promote digestion. The finest kind of the prepared fruit is called by the merchants Picholine, after one Picholini, an Italian, who first discovered the art of pickling olives.

The culture of the olive abroad may be said to resemble that of grass orchards in Britain. It is propagated by suckers, large cuttings, or truncheons planted in trenches four feet deep, into which it is still the custom to deposit stones for encouraging moisture about the roots, as described by Virgil. (Georg. ii, 346.) It is also propagated by chips of the stool, in the following manner: An old tree is cut down, and the ceppo, or stock, is cut into pieces of nearly the size and shape of a mushroom, and which, from that circumstance, are called uovoli, Care is taken that each uovolo shail have a small portion of bark. After being dipped in manure, the uovoli are planted thick in a bed and covered with earth to the depth of three inches; they soon throw up shoots, and are transplanted at the end of one year, and in three more are fit to be finally removed to the olive plantation.

The olive in Britain grows readily by cuttings, or may be grafted on the privet. With protection during frost, it may be maintained against a wall in the latitude of London. Some trees so treated, produced a crop in the garden of Camden House, Kensington, in 1719; and in Devonshire, some trees have stood the winter for many years as standards, though without ripening their fruit. Large plants are frequently imported from Genoa, along with orange and pomegranate trees.
O. fragrans is highly odoriferous both in the leaves and blossoms; the plant is much esteemed on that ac count in China, and the leares used at once to adulterate and flavor teas,

History，Use，Propagation，Culture，
33．Phillyrea．Said to derive its name from $\varphi u \lambda \lambda o v$ ，a ledf，an etymology far from satisfactory．The genus consists of ornamental evergreen shrubs，the supposed varieties of which have been considered distinct species by most modern botanists．Some authors have united the genus with Olea；but they have not been followed generally．
34．Chionanthus．From $\chi$ bov，snow，and $\alpha v$ 四，a flower．Le Chionanthe，Fr．Der Schneeblume，Ger，and Albero de neve，Ital．Both species are highly ornamental shrubs or low trees；their leaves are above half a foot in length，and $1 \frac{1}{2}$ inch in breadth；their flowers white，in numerous long bunches，and their fruit of the size and color of a sloe．They are propagated by seeds or grafting on the common ash．
35．Notelea．From voros，south，and $£ \lambda \alpha \omega \alpha$ ，olive：the olive of the south．A small ornamental genus of nearly hardy shrubs，which would probably endure the climate of this country in a favorable situation．
36．Ligustrum．From ligare，to tie，on account of its long pliable branches．La Fresillon，Fr．Der Liguster， Ger．，and Legustro，Ital．The privet in old authors is called primprivet，as Professor Martyn conjectures，from its patience under the sheers．Few shrubs exceed it as a garden hedge－plant：it will thrive in the middle of coal－burning cities，in the shade，and under the drip of trees；though to flower well it requires an open airy situation．Cows，sheep，and goats eat it，but horses refuse it．
The Sphinx ligustri，$L$ ．，or privet hawkmoth，and Phalæna syringaria feed on it in the caterpillar state：the blister beetle，Lytta vesicatoria，from which cantharides is formed，is also found on it．Fully grown， the wood is fit for the turner，and a rose－colored pigment may be prepared from the berries，which，with alum， dye wool and silk of a durable green．The berries remain on the tree during winter in elegant purple clusters， and are not eaten by birds excepting in very severe weather，when bullfinches and some others feed on them． Like most plants that have been long in cultivation，the privet varies in its leaves，flowers，and fruit，and in the duration of the former．In its cultivated state it is always evergreen；found wild in woods and hedges，is ge－

## 143 Leaves linear lanceolate entire

144 Leaves lanceolate entire or serrate in the middle, Leaves 3-nerved
145 Leaves oblong lanceolate sub-serrate in the middle obsoletely veined, Branches erect
146 Leaves oblong lanceolate acute obsoletely serrated at the point veiny, Branches veiny
147 Leaves oblong lanceolate nearly entire obtuse narrowed at the base veiny
148 Leaves elliptic oblong nearly entire veiny somewhat obtuse
149 Leaves ovate oblong rounded at the base veiny serrated, Serratures with stiff points
150 Leaves ovate rounded at the base serrated acute veiny
151 Leaves oblong serrated acute at each end veiny
152 Racemes terminal, Stalks 3-flowered, Petals linear lanceolate, Leaves coriaceous
153 Leaves obovate lanceolate membranaceous pubescent, Panicles very lax, Fruit elliptic
154 Spikes axillary very short, Leaves oblong elliptic acute
155 Leaves lanceolate pointed sub-reclinate, Racemes length of the leaf-stalks
156 Leaves lanceolate acute sub-erect, Racemes as long as the leaves
157 Leaves opposite rigid broad lanceolate entire, Bunches axillary
158 Leaves ovate oblong pointed shining above, Flowers spreading
159 Leaves ellipt-lanceolate smooth, Racemes compound dense

160 Leaves ovate cordate, Branches stiff white colored

161 Leaves ovate-lanceolate, Branches stiff mottled
162 Leaves lanceolate, Branches virgate mottled

163 A delightfully fragrant plant, Leaves cordate, Flowers panicled
164 Leaves opposite sub-sessile oblong or cordate, Calyx with subulate teeth, Berries globular

165 Leaves cordate downy, Umbels terminal sessile many-flowered
166 Branches round pubescent, Leaves ternate oval pointed, Calyx bell-shaped with very short teeth

and Miscellaneous Particulars.
nerally deciduous. Sometimes the leaves grow by threes, are enlarged at the base and variegated. The regular number of stamens is two ; but sometimes there are three or four in a flower. The berries are usually purple or black, but some have been seen of a white color; and a yellow fruited variety is common in the gardens. A kind of vegetable wax is said to be obtained from $\mathbf{L}$. lucidum in China.
37. Syringa. Some say from इuesv, an Arcadian nymph, or, more properly, here, a pipe. The tubes of the finest Turkish pipes are manufactured from the wood of it; but the true root of the word is to be found in sirinx, its native name in Barbary. Lilac is a Persian word signifying a flower. Le Lilas, Fr. Die Syrene, Ger., and Syringa, Ital. All the species are most beautiful flowering shrubs, readily propagated by suckers, which they throw up in abundance. The common lilac seems to have been introduced before or during the reign of Henry VIII; for in the inventory taken by order of Cromwell of the articles in the gardens of the palace of Nonsuch, are mentioned six lilackes ; trees which bear no fruit, but only a pleasant smell. S. persica is well adapted for forcing in pots ; but so treated its flowers are without fragrance.
38. Nyctanthes. From ve, night, and av $\theta$ os, flower, night-flower; its flowers expanding and smelling only in the night. L. Arbor triste, Fr. Der Trauerige baum, Ger. It grows freely in loam and peat soil mixed, but seldom produces its exquisitely fragrant flowers in England. Sweet thinks it is generally kept too warm, and recommends a trial in the greenhouse or open air; but its appearance would probably be little improved by any manner of treatment, as it has but an indifferent aspect in its own country. Cuttings not too ripe, root readily in sand under a hand-glass.
39. Jasminum. From the Arabian jasmin (ysmyn). Linnæus obtained a fancied etymology from sec, a violet, and ofun, smell. Le Jasmine, Fr. Der Schasmine, Ger,, and Il Gelsomino, Ital. The flowers of J. sambac are of exquisite fragrance, and in high csteem bcth in the East and West Indies. It grew in the Hampton Court garden at the end of the 17 th century ; but being lost there, was known in Europe only in the garden of

## History，Use，Propafation，Culture，

the Grand Duke of＇luscany at Pisa，where Evelyn informs us（Mcmoirs，\＆c．by Bray），the plant was placed under guard that no cuttings might be purloined．A plant sent to Miller in 1730 restored it to England，and it is now a common greenhouse shrub．Plants of J．humile，also very odoriferous，are commonly imported from Genoa along with orange－trees．J．officinale has been a favorite wall－shrub from time immemorial．Its native country，as well as the date of its introduction are unknown．Gerarde，in 1597，says it was in common use for eovering arbors，J hirsutum is a tall tree，whose sweet－smelling flowers open during the night and fade at sun－

68 Leaves opposite simple ovate ellipt. Calyx smooth campanulate: teeth very short
169 Leaves lanceolate mucronate sub-coriaceous, Flowers 3 terminal
170 Leaves polished 3-nerved pointed, FL sol. Cal. 6.7 toothed, Cor. 6.8 part. Seg. filif. longer than the long tube
71 Spreading, Leaves obl. polished, Flowers 3 or many term. Cor. 6.8 part. Segm. linear acute equal to thbe
172 Erect every part polished, Leaves ternate oval obtusely acuminate, Panicles terminal
173 Leaves simple cordate obl. shining, Branches and fiower-stalks hairy, Racemes 3-flow. Calyx-teeth straight
174 Leaves sub-ternate, Leaflets ovate the pair minute or wanting, Teeth of cal. 5 gland. Cor. 7 part Berr. glob.
175 Leaves compound ternate ovate and sub-cordate, Calyx campan. smooth, Segma. of corolla equal to its tube
176 Leaves alternate ternate and simple, Leaflets sub-cuneate, Calyx-teeth subulate
177 Leaves alternate acute ternate and pinnate, Branches angular, Calyx-teeth very short
178 Leaves alternate obtuse ternate and pinnate, Branches slender, Calyx-teeth very short
179 Leaves in about 3 pairs ovate lanc. on short stalks, Cym. term. few or many-fl. loose, Anth. mucr. partly exsert. 180 Leaves pinnate acuminate, Buds upright
181 Leaves opposite pinnate exterior 3 or 5 leaflets confluent, Flowers terminal, Buds horizontal
Racemes or Spikes terminal, Leaves whorled and opposite.
182 Leaves 56 or 9 together lanceolate sessile
183 Leaves 45 together lanceolate ovate stalked, Flowers cylindrical
184 Leaves 3 or 4 together ovate or ovate-lanceolate sub-biscrrate; serratures unequal
185 Leaves ternate and opposite obl.-lanc. serrate, Cal. acute, Cor. notched. [equal shorter than capsule 186 Leaves 3 or 4 togeth. lin. lanc. from an ov. base acumin. deeply doubly serr. with the stem sub-pub. Cal. nearly 187 Leaves opp. linear narrowed by degrees very acute remotely serrated, Bractes longer than the flower-stalks 188 Leaves 3 or 4 together nearly sessile lanceolate simply serrate; serratures equal
189 Leaves narrow lanc. remotely serr. or in. and very ent. Bract. much longer than fl.-stalks, Stem ascending 190 Spikes lateral short nodding, Leaves opp. folded tygether toothed. tceta thick, segments of corolla entire 191 Leaves lan. lin. narr. by deg. to very end finely serr. the serrat. at base on car deep. Bract. ionger than flower-st. 192 Leaves sub-sess. ovate acute serrated pubes. Flower bearing branches in hundles, Fow. sub-sess. very small 193 Leaves opp. 3 togeth. sub-cord. lanc. simply serrated with the stem smooth, Serratures remote nearly equal
194 Stem pubes. Leaves opp. and tern. lanc. rather fleshy simply and remotely serrate wedge-shaped at the base 195 All over slightly pubes. Leaves 3 togeth. lanc. acumin. sub-cord. at base doubly serrate: serrat. of base deepest 196 Leaves very long almost coriaceous opp, or 3 together on short stalks cordate at base acutely and unequally 197 Leaves lanceolate acute simply serrate entire at the end, Serratures distant simple equal
198 Leaves opposite and 3 together lanceolate acute serrate with the stem downy, Serratures near unequal
199 Leaves opp. and tern. lanc. very much lengthened out serrated to the very end, Bract. longer than fl.-stalk

01 Leaves opposite 3 or 4 together cordate lanceolate acuminate doubly serrated with the stem downy
$2 y_{2}$ Leaves 3 or 4 tog. at base widely cord. lanc. deeply doubly acutely uneq. dent. serr. Serr. sprdg. lowest distant.
203 Leaves 3 or 4 tog. ov. acum, cord. at base doubly acutely and uneq. serr. beneath and with the stem pubesc.
Racemes terminal, Leaves opposite.
204 Hoary, Leaves lanceolate serrate acute at the base wedge-shaped and entire, Stem erect
205 Hoary, Leaves lanceolate crenate and nearly entire obtuse, stem erect
206 Leaves on short stalks stiffish cordate at the base pointed closely acutely and doubly serrate, Stem pubescent 207 Leaves ovate oblong crenate stalked obtuse with the stem pubescent, Spikes many, Bractes very small 208 Stem simp. pub. Lvs. op. lan. obl by deg. narr. fr. base point. ser. ent. at end, up. onessub-ser. Br. Ion. than fl-st. 209 Slightly pub. Lvs. cren. the rad. ov. obl. running down intostalk, Caul. lanc. sess. 210 Toment. with stlkd. glands, Lvs. tooth. rad. ov, runn. down intost. Caul. lan. stlkd. Fl. in spks. Br. \& cal. cil. 211 Villous, Leaves serr. rad. ovate, Caul. obl. acute stalkd. at base and end entire, Fl. in racemes, Bractes hinear 212 Villous, Leaves cren. rad. ov. Caul. obl. obtuse sub-sess. Flow. in racemose spikes, Br. and cal. smooth ciliate 213 Slightly pubesc. Leaves crenulate radical oblong ovate running down into stalk, Cauline lanceol, acuminate sub-sessile, Flowers in close spikes
214 Lvs. uneq. tooth serr. with stem pub. rad. stlkd, ov. Caul. sub-sess. ellipt. obl. Fl. in spks. Br. lin. lon. than cal. 215 Leaves opp. ov. lanc. runn. down into st. the lower cren. the upp. ent. Spks. term. or 3 tog. Fl. like an orchis 216 Leaves ov. lan. uneq. ser. Br. lan. as long as cal. Cal. 4 part. uncq. Seg. ov.obi. Caps. sme. rather long. than cal. 217 Leaves cordate ovate sessile very obtuse with the very simple stem hairy, Hacemes few-f. Calyx smooth 18 Leaves oblong ovate cut and serrated with the stem somewhat villous
219 Stem ascending, Leaves in fasc. the lower pinnate, the upper pinnatifid and simp. Leaf. and div. filif. sprdg. 220 Leaves in fasc. stalked pinnatifid lanc. Segm. nearly entire, Racemes several, Seg. of the Calyx lanceolate 221 Leaves in fasc. on short stalks linear pinnatifid: Seg. entire, Raceme nearly sol. Seg. of calyx oblong ovate 222 Raceme corymbose term. Leaves radical obl. connate sheathing cartil. crenate or ent. Stem simp. ascending 223 Stem ascend, feeble, Lvs. lanc. obt. sub-serr.: lower sheathing, Rac. loose, Up. seg. or cor, wider than side ones 224 Leaves obov. cren. with simple assend, stem pilose, Cauline lvs, remote, Rac. corymb. hairy about 5 -flowered

and Miscellancous Panticulars.
rise. All the species thrive in any light loamy soil or loam and peat, and cuttings root freely in sand under a hand-glass.
40. Veronica. A word said to have been altered from Betonica. (See that name.) La Verorique, Fr., and

Ehrenfreiso, Ger. V. Gfficinalis has been much recommended in Sweden and Germany as a substitute for tea, than which Professor Martyn snys, it is more astringent and less grateful. Withering prefers V. Chamedrys for the same purpose. Several species were formerly in repute in medicine, and given in disurders of the lungs,

History, Use, Propagation, Culture,
but they are now laid aside by regular practitioners. V. Beccabunga (latinised from bachounge, its German appellation: bach is a brook; beck, provincial English), is sometimes gathered with watercresses, with which it is often found in limpid streams, and used as a spring salad. Almost all the species thrive in any soil or situation; the tallest are ornamental border flowers; the dwarf spreading sorts are well adapted for rock-work, edgings, or to be grown in pots. A few delight in peat soil, and some in moist situations; all are increased by seed, subdividing at the root, or cuttings. V. decussata will endure the open air if protected from frost.
41. Galipea. A name framed by Aublet from the vernacular appellation of the plant in French Guiana, where it is a native.
42. Schwenckia. John Theodore Schwenck was a professor of medicine at Jena; died in 1671. There was another Schwenck a professor of botany to the garden at Leyden. The genus is, like the merits of the professors, but little known. One inconspicuous species is occasionally seen in our stoves. The

225 Upper leaves obl. sub-serr. Stems erect $\frac{2}{8}$ shrubby, Rac, many-fl.Caps, roundish ov. scarcely longer than calyx 226 Upper leaves obl. obov. sub-serr. Caps. ovate larger than calyx, Stems shrubby diffuse, Corymb. term. few-fl.
227 Leaves smth. ellip. ov. ent. or ser. Corymb. term, somew, spiked, Cal. cil. Caps. ob. Stems tufted herb, simple
$\beta$ Leaves elliptic ovate obtuse entire
228 Peduncle axillary subracemose few-flow. Leaves obovate obtuse sub-serrated, Fl.-stalks and calyxes pilose
229 Leaves opp. oblong crenate with the calyxes smooth, Racemes elongated, Flowers distant, Stem ascending 230 Glandular hairy, Stem ascending, Leaves oblong acute sub-crenate, Raceme elongated
231 Leaves opp. ovate irregularly crenate, Stem ascending, Bractes scarcely longer than flower-stalks Racemes lateral.
232 Racemes few-flowered, Leaves elliptical perennial entire, Stem shrubhy
233 Radical leaves roundish and oblong, Stem nuked very short, Flower-stalk like a scape about 3-flowered 234 Leaves elliptical obtuse on short stalks serrulate, CaL 4-parted, Stem procumbent below rooting
235 Leaves lanceolate serrate stem clasping, Cal. 4-parted, Stem erect
336 Leaves linear lanceol. nearly entire, Flow.-stalks pendulous or spreading, Cal, 4-parted, Stem nearly erect 237 Leaves lin. lanc. lower pectinate pinnatifid, upper entire, Cal, leaves unequal subulate, Stems procumbent 238 Leaves sess. pinnatifid and bipinnatifid, Lower bracte 3 -fid longer than fl.-st. Cal. 5-part. Stem nearly erect 239 Leaves sess. lanceol. inciso serrate and pinnatifid, Bracte entire shorter than fl.-st. Cal. 4-part. Stem feeble
240 Leaves bipinnatifid, Segm. lanceol. and lin. Cal, leaves unequal subulate, Stems procumb, woody at base
241 Leaves oblong roundish stiff shining, with the procumbent creeping stem smooth, Flowers in close spikes
242 Leaves obovate or roundish serrate, Cal. 4-parted, Stem rooting at the bottom
243 Leaves sessile oblong obtuse serrated : the upper lanceol, flat, Cal. 4 or 5 -part. Flowering stem ascending
244 Stem erect hairy all over, Lvs, sub-sess. oval coarsely and acutely cren. hairy, Cal. 4-part. larger than corolla
245 Leaves somewhat heart-shaped ovate sessile unequally obtusely serrate, Stem erect, Cal. 5-leaved
246 Lower leaves oblong coarsely serrated with the stem villous
247 Leaves sub-sessile ovate lanceolate unequally serrated, Cal. 5-parted, Segm. and bractea linear subulate
248 Lvs. cut serr. the upp. cord. ovate sess. the low. ov. stalk. Cal. 4-part. Stem hairy in 2 rows, Rac. long. than stem 249 Leaves sessile cordate ovate acute serrate, Cal. 4-parted, Stem erect
250 Leaves cord. ovate obtuse coarsely serrated with the stem and stalks hairy, Cal 4-part. Rac. elong. filiform 251 Racemes Iateral stalked many-fow. Leaves entire very smooth ovate acuminate joined together at the base 252 Racemes very long, Leaves elongate lanceolate acuminate unequally serrate
253 Fl.-stalks rather longer than bract. Lvs. lanc. wedge-shaped at base simply and doubly toothed,Stem prostrate Flower-stalks one-flowered.
254. Flowers sub-sess. Leaves finger-parted, the upper undivided; Fl.-stalks shorter than the calyx, Stem erect 255 Flowers sessile, Leaves all finger-parted
256 Lower leaves entire : middle finger-parted : upper trifid, Fl.-stalks longer than calyx, Stem erect spreading 257 Leaves as long as stalk cord. rounded 5-lobed : the upper 3-lobed, Segm. of cal, cord. acute, Stem procumbent 258 Leaves cord. rounded with 5 or 9 but generally 7 teeth obtuse a little fleshy, Cal, of fruit spread. Caps. hairy 259 Flowers sessile, Leaves oblong a little serrate longer than calyx, Stem erect
260 Leaves roundish cordate crenate, Flower-stalks very long, Calyx leaves lanceolate
261 Flower-stalks as long as the leaves, Calyx 2-leaved, Leaflets 2-lobed scrrate
262 Low. lvs. stalk, cord. ov. serr. floral nearly sess, short, than fl.-st. Caps. obov. emarg. turgid, Stem rather upr. 263 Flow. stalked, Low. Ivs. stalked ov. serr. fioral s.-sess. as long as fl.-st. Caps, obcord. comp. Stem nearly simple 264 Flow. nearly sess. Low. lvs. stalked cord. ov. serr. caul. cren. floral lanc. sess. longer than stalk, Cal. unequal 265 Leaves stalked cord. ovate serr. Cal. leaves ovate, Stem procumb. Fl.-stalks scarcely shorter than the leaves

266 Leaves alternate stalked, lanceolate entire

207 Stem slender simple, Leaves lanceolate, Cor. thrice as long as calyx

268 Leaves lanceolate serrate somewhat 3-nerved, Flowers on stalks
269 Leaves oblong acutely serrated, Stem creeping, Flowers racemose.
[acuminate longer than the calyx
270 Leaves obovate lanc. narrowed below remotely toothed nerved smooth, Fl. -stalk alternate very short, Caps. 271 Leaves lin. lanc. with a few teeth, $F 1$, -stalks as long as the leaves, Caps, much shorter than the subulate calyx

272 Stalk of fruit on one side deflexed at base
273 Stalk of fruit spreading all ways straightish

d Miscellaneous Particulays.
appendages to the corolla are very singular, and demand a better explanation of ther nature than has yet been offered.
43. Gratiola. From grātia, grace (of God). Matthiclus called it gratia Dei, in allusion to its effects. G. officinalis is so bitter and obnoxious to cattle, that Haller assures us, there are meadows about Yverdun rendered entirely useless by its abundance. It is a powerful cathartic, and was long in use as such, but now laid aside.
44. Schizanthus. So named by the authors of the Flora Peruviana, from $\sigma \chi^{\circ} 5 \omega$, to cut, and av $9 \circ 5$, a flower. One of the most beautiful of herbaceous genera. Two species or rather varieties are now known, and ornament the green-house with their elegant panicles of lilac and white flowers. They are difficult of cultivation, requiring a very pure and moist atmosphere. They may be propagated by cuttings, but the best plants are raised from seeds, which have not hitherto been obtained, except from flowers artificially impregnated.

History, Use, Propagation, Culture,
45. Elytraria. From eגvтеєy, an envelope, its stem being covered with sheaths or scaly envelopes. Little herbaceous plants of no ornament.
46. Hypoestes ; ixoso $n 5$, is an interior garment: it is probable that the involucrum suggested the application of the name. The plants have the habit of Justicia, from which they have been separated, and are chiefly tropical weeds.
47. Justicia. In honor of James Justice, F.R.S., an eminent Scotch cultivator, author of the Scotch Gar. dener's Director, published in 1784. J. pectoralis has the smell of new hay, combined with a refreshing aroma. In Domingo and Martinico the inhabitants make a syrup of it, which they use against disorders of the breast. The bruised leaves are good in wounds, whence the English appellation balsam, and the French name herbe à charpentiére. J. nasuta is said to possess extraordinary aphrodisiacal powers, and milk boiled in the roots is much employed on that account by Indian physicians. Rubbed with limejuice, the roots are used to cure ring-worms. Most of the species are free flowerers, some as J . lucida

274 Flowering scales ovate villous at edge, Leaves lanceolate smooth entire, Scapes very long, Caps, obtuse 275 Stemless, Flowering scales ovate entire, of the scape lanceolate naked at the edge, Leaves oblong crenate

276 Racemes axillary erect shorter than the leaves which are lanceolate toothed and with the stem hairy 277 Spikes axillary and terminal, Bracteas lanceolate smooth, Branches pubescent

## 278 Panicles axillary dichotomous

Calyx double.

## Calyx simple, Flowers labiate.

279 Spikes terminal 4-sided imbricated, Bracteas oval, Leaves oblong ovate acuminate, Helmet linear 980 Spikes terminal, Bracteas and leaves elliptical, Helmet lanceol. reflexed at the end, Stigma of two plates 281 Leaves linear lanceolate, Flowers nearly solitary sessile tubular 4-cleft
282 Spikes terminal 2-ranked, Bractes setaceous, Leaves linear lanceolate
283 Racemes term, somewhat branched, Cal. whorled smooth, Leaves lanc. elliptic, sharpat both ends stalked
284 Racemes term. comp. Pedunc. 3 or 4-flowered, Bract. lanc. Leaves oblong pointed, Branches square rough
285 Racemes axillary and terminal, Flowers inflated at the throat whorled, Leaves elliptical variegated
286 Stems 4-sided brachiate, Leaves sub-sess. lanc. Flowers 1 -sided erect, Lip linear revolute, Flowers downy
287 Racemes terminal compound 1-sided many-flowered, Bract. setaceous, Leaves ovate oblong. acuminate
288 Flowers axillary solitary sessile opposite, Calyx hispid, Leaves lanceolate obtuse ciliated at the base
289 Spikes terminal in heads, Leaves elliptic nerved blistered shining, Upper lip of corolla lanceolate
290 Spikes terminal leafy, Flowers whorled, Leaves elongated
291 Spikes axillary and terminal, Bractes oblong imbricate ciliate obtuse
292 spikes axillary, Flowers close, Flower-stalks elongated alternate, Leaves lanceolate
29: Spikes lateral and terminal, Calyx 4-leaved linear hairy, Lower lip ovate, Leaves oblong
294 Spikes axillary and terminal filiform, Spikelets whorled
295 Spikes axillary and terminal, Flowers in pairs below single above, Bractes wedge-shaped
096 Upper lip of corolla subulate, Flower-stalks axillary dichotomous, Leaves elliptical entire
297 Panicle terminal dichotomous, Flowers spiked distant
298 Upper lip emarg, reflexed, Flowers axillary solitary sub-sess. opposite : term. in spikes, Lvs. ovate lanccolate 299 Lower lip 3-lob. Flow, axillary solitary and spiked, Lvs. ovate oblong narr, at each end, with stem pubescent 300 Lower lip 3-lobed, Flowers axillary sessile whorled, Bractes linear lanceolate, Leaves lanceolate.

Calyx simple, Flowers ringent.
301 Spikes axillary and term. Flowers opposite, Bract. shorter than cal. Stem. and branc. round 6-streak. Leaves 302 Spikes axillary opposite, Bractes ovate acute nerved
[ovate accuminate wavy-stalked
303 Spikes terminal, Bract. ovate acuminate netted with veins, Leaves lanceolate ovate stalked
304 Leaves lanceolate entire obtuse, Peduncles axillary 3-flowered 2-edged, Bractes shorter than the calyx
305 Peduncles solitary axillary one-flowered, Leaves lanceolate acute at each end sessile
306 Umbels axillary 3-flowered, Bractes 2 wedge-shaped, Leaves ovate, Flowers in loose spikes
307 Spikes axillary and terminal recurved, Leaves lanc, ovate hairy sessile, Bractes 2, Flowers in loose spikes
308 Flowers axillary rather whorled, Bractes 2valved subcordate, Leaves ovate
309 Spikes axillary and term. 1-sided villous, Dorsal bractes lanc. 2-ranked with a membran. margin at the base 310 Spikes terminal, Bractes obovate retuse imbricated smooth, Leaves ovate acuminate

311 Flower-stalks about 1-flowered, Leaves oblong, Spines axillary
312 Spikes axillary and terminal imbricate, Bractes oblong veiny, Leaves ovate acuminate
313 Leaves ovate acumanate repand, Corolla with a long tube white with a purple stain

## 314 Stemless, Leaves radical very smooth coarsely crenate, Flowers on one side

315 Leaves all pinnate: pinnæ toothed, of the lower leaves pinnatifid
316 Lower leaves pinnate: superior pinnatifid 3-lobed and simple
317 Leaves lanceolate very rugose with spreading teeth, Flowers terminal dichotomous
318 Leaves lanceolate toothed rugose, Fluwers terminal dichotomous

and Miscellaneous Paiticulars.
are shewy; others are the commonest weeds of the tropics; all are readily propagated by cuttings in heat under a glass.
48. Dicliptera; $\delta 65$, double, and $\approx \lambda \varepsilon \iota \omega$, to shut. The fruit being compounded of two valves. This genus has been formed like Hypoestes out of the Linnæan Justicia, with which it agrees in habit.
49. Eranthemum. A name applied by the ancients to their Anthemis, from sces, spring, and cu, 05 , a flower. The word has been applied to the present genus with no apparent reason. The species are very pretty ornaments of the stove.
50. Wulfenia. Named after F. X. Wulfen, a German botanist, and author of a work on the plants of Carinthia. A small and very beautiful herbaceous plant.
51. Calceolaria. From calceolus, a slipper, in allusion to the shape of the corolla. C. pinnata may be raised frum seed in a hot-bed in spring, and transplanted to the borders with other tender annuals. The regions of Chili and Peru abound in many splendid species, some of which have lately been introduced to this country.

History, Use, Propagation, Culture,
C. corymbosi and paralia, are exceedingly beautiful herbaceous plants of difficult increase. The shrubby and branching herbaceous kinds are easily propagated by cuttings,
5.. Pinguicula. From pinguis, fat, on account of the greasiness of its leaves. In P. vulgaris, the structure of the stigma, and its close application to the stamens is very remarkable. Linnæus says, that the warm milk of the rein-deer poured on the fresh leaves, and set aside for a day or two, becomes acescent; acquires consistence and tenacity, and neither the whey nor the cream separate. In this state it is considered a very grateful food in Sweden and Norway. On cows' milk it acts like common rennet. The plant eaten by sheep has been supposed to produce the liver-rot; but a flat apterous insect, the fasciola hepatica or fluke, found adhering to stones and plants in boggy grounds, as well as in the liver and biliary ducts of sheep affected by the rot, is a more likely cause, and the more especially as no animal whatever will feed on the plant. The species (except P. grandiflora) are cultivated with difficulty in artificial shaded morass. P. grandifiora will thrive well on a dry northern bed of bog-mould among North American shrubs.
53. Utricularia. From utricula, a little bottle, from the small inflated appendages to the root. The species are scarcely susceptible of cultivation : they are very numerous in hot countries, and there form the most elegant ormaments of rivulets and pools of water. The flowers are fugacious, and so delicate as not to be capable of preservation as dried specimens, in which state their naturally beautiful colors of purple, pink, violet, or
yellow, all change to a dead and uniform black.

## Order I.

319 Leaves radical ovate and cordate stalked twice-crenate, Cauline cordate half embracing the stem 320 Leaves unequally toothed: the radical cuneate; upper oblong connate with the Capsules tomentos
321 Leaves spatulate entire hairy above, Flower-stalks like a scape 1-flowered
322 Nectarium conical thick at the end, obtuse shorter than the flowers, Scape villous, Capsules globose
323 Nectarium subulate nearly straight as long as the petals, Upper lip 2-lobed: lower 3-parted, scape smooth
324 Nectarium conical recurved shorter than the petals in spreading emarg. very large; lower 3-lobed throat
325 Nectarium subulate straight as long as the the campan. flower, Throat bearded, Lips toothed, Scape villous
326 Nectarium subulate recurved shorter than cor. colobed : lobes emarg. entire, Palate prominent,
327 Nectarium subulate recurved shorter than the campan. cor. 5-lobed: lobes emarg. entr, [Scape pubescent
328 Nectarium conical, Upper lip entire equal to the palate, Leaves very finely divided . Cor. with throat open 330 Nectarium carinate, Upper lip emare twice as long as the palate, Leaves dichotomously 3-parted

331 Leaves lanceol. obl. narrower at the base remotely toothed with stem very smooth, Bract. lin. lanceolate
332 Leaves oblong ovate tooth-serrated smooth, Branches hairy, Bractes ovate shorte calyx
333 Leaves ovate serrate rough rugh the stem hoary, Bractes lanceolate shorter than the calyx
335 Leaves ovate obtuse serrate, Spikes lax, Bractes subulate shorter than the calyx
336 Leaves ovate crenate serrate smooth very obtuse
337 Leaves ovate acutely crenate with the stem very hairy, Spikevery long, Bract. appressd smaller than the cal.
3:38 Leaves ovate lanceolate villous sinuate serrate
339 Leaves pinnatifid hairy, Lobes oblong somewhat toothed
340 Leaves lanceolate : the lower pind, Segments lanceolate: lowest the shortest, deeply cut at the end
341 Leaves pubescent ovate pinnatifid, Segments lanceolate: lowest the shortest,
342 Leaves opposite stalked 3-parted coarsely serrated smooth
343 Bractes ovate acumin. ciliate, Leaves elliptic lanceolate
344 Flowers in spiked racemes, Bractes obovate nerved acute, Leaves ovate
345 Flowers lateral, Leaves lanceolate
346 Leaves lanceolate naked nerved of one shape entire hoary, Flowers in spikes ame shape entire ciliated 348 Leaves ovate acuminate nearly entire nerved, Flowers in heads, Calyx hairy pubescent at base
349. Whorls terminal and axillary close hispid, Leaves ovate sub-ciliate, Stems procumbent hairy

350 Flowers lateral, Leaves lanceolate entire ciliated, Cor. with an inflated throat twice as long as caly $x$
351 Leaves ovate serrate sessile, Flowers axillary and terminal, Stems erect
352 Leaves ovate acuminate, Flowers in heads, Stem decumbent
353 Pubescent, Leaves oblong serrated, Flowers axillary whorled, Lower lip of calyx with 2 ciliated bristles 354 Leaves oval entire, Flowers whorled, Stem square
355 Leaves obl. lanc. cord. pubesc. remotely and closely ser. Flowers in heads, Involucr. purple stem swollen 356 Leaves ovate oblong cordate pubesc. coarsely serrated, Flowers in heads, Involucr. purple, Stem fistular 357 Leaves obl. cord. pub. remotely serrate : upper entire, Flow. in heads, Invol. pale, Upper lip of cor. bearded

and Miscellaneous Particulars.
54. Stachytarpheta, $5 \alpha \chi \nu 5$, a spike, and $\tau \alpha \rho \emptyset s \circ \rho$, dense. The name would be better changed, as it has been by Link, to Stachytarpha. This genus is partly composed of Verbena, $L_{\text {. }}$.
nearly always in flower. All of them strike readiy in heat under gass. 55. Lycopus. From $\lambda v z o s$, a wolf, and w४s, a foot, on account of Ger, and Licopo, Ital. L. europæus is comand a wolf's foot. Le Marrube aquatique, mon in most parts of Europe in meadows, but is not thein their skin with it. According to Adamson, it has two to linen, wool, and silk. Withering says, gypsies stain their skin withic. Acco 82 flowers in a whorl.
barren filaments; and Pollich remarks, that there are som to the color of the flower. A pretty annual, not very
56. Amethystea. From $\propto \mu \in গ \cup 505$, the amethyst, alluding common in gardens.
57. Zixiphora. Etymology uncertain. This genus, and the two following, consist of little herbaceous plants resembling thyme : they are generally pretty, and easily cultivated. It
58. Cunila. A Roman name applied by Linnæus to this genus. The plants of Pliny bore some resemblance to
hose which compose the Linnæan Cunila. (See No. 57.) The leaves of C. mariana are used in decoction for colds,
59. Hedcoma, ทंठvosu\&, a Greek name for mint. (See No. 57.)
60. Monarda. In honor of Nicolas Monardez, a physician of Seville in the 16 th century. Most of the species

History，Use，Propagation，Culture，
are aromatic，and resemble mint in their habits and mode of culture．The leaves of M．didyma are sometimes used as tea in North America；its flowers are of a very brilliant scarlet．
61．Rosmarinus．Two Latin words signifying dew of the sea．The shrub grows in the southern parts of Europe in the vicinity of the sea．R．officinalis yields，by distillation，a light－pale essential oil of great fra－ grance，which is imparted to rectified spirit．It was formerly recommended for strengthening the nervous sys－ tem，headaches，\＆c．as well as to strengthen the memory．Hence the allusion of the poet，＂there＇s rosemary， that＇s for remembrance．＂Rue in former times signified grace；and rosemary，repentance．Rosemary was considered as an emblem of fidelity in lovers；it was worn at weddings and funerals，and on the latter occa－ sions is still in some parts of Wales distributed among the company，who throw the sprigs in the grave along with the corpse．It is the principal ingredient in Hungary water，and is drunk as tea for headaches，and by nervous persons．It prefers a lean dry soil，or rubbish of old buildings ；and when it has established itself on a wall，will resist the greatest cold of our winters．Its introduction is beyond record，and was probably by the monks in the dark ages．

62．Salvia．From salvere，to save，on account of its supposed healing qualities．This large and very natural

358 Leaves oblong lanceolate rounded and narrowed at the base villous flat, Cor. dotted
359 Leaves ovate lanc. rounded and unequal at the base pubesc. remotely serr. Flowers in heads, Bractes pale 360 Smooth, Heads large leafy, Calyx colour. bearded, Cor. long smooth, Lvs, ov, obl. coarsely serr. Stem smooth 361 Leaves ovate acuminate rounded at base and equal hairy coarsely serrated, Flowers in heads, Bractes pale 362 Leaves ovate lanceolate cordate smooth rugose
[bright crimson
363 Leaves obl. painted stalked ovate, Flowers in heads, Bract. smail acute, Stem square pilose, Flowers very long 364 Leaves ovate acum. sub-cordate closely serrated smoothish, Flowers in headed whorls, Involucres purple 365 Leaves ovate attenuated, Stems and whorls hairy, Bractes ovate as long as the calyx
366 Very hairy all over, Flowers small in whorls, Leaves ovate acuminate serrate on long stalks, Stem square 367 Leaves lanceolate remotely serrated smooth, Flowers in whorls, Bractes pale

## 368 Leaves sessile

360 Leaves on stalks

## Calyx 3-lobed, enlarged.

370 Leaves ovate lanceolate rugose crenulate undulate, Calyx blunt longer than ovate bracte
371 Leaves ovate crenate flat hoary netted with veins, Calyx 3-lobed dilated retuse with little lips 372 Leaves triangular hastate oblong crenated obtuse
373 Hoary, Lower leaves roundish truncate at base smooth : upper oblong entire, Calyx of fruit large
374 Leaves linear oblong serrate, Whorls 2-flowered, Calyx obtuse
375 Leaves interruptedly pinnate, Stem shrubby erect
376 Leaves pinnate in 2 or 8 pairs, Leaflets sess, lanceol, obtuse crenulate rugose, hoary beneath, Bract. cordate 377 Hairy viscid, Leaves interruptedly pinnate, Leaflets oblong eroded unequal-sided, Calyx inflated 378 Leaves pinnate entire, Leaflets lanceolate nearly equal: upper generally in pairs

Calyx 3-toothed, sub-cylindrical.
379 Leaves lanc. obt. remotely serrate stalked beneath pub. Spike racemose winged, whorls 2-fl. Bract. lanceolate 380 All hairy, Leaves oblong ovate crenate, Flowers in spiked whorls, Bractes roundish acute
381 Leaves lanceolate: the lower serrated outwards, with the stem hoary, Lower lip very broad, Calyx acute
382 Leaves linear lanceolate the lower serrated outwards with the stem smooth, Segments of calyx rounded
383 Leaves ovate acute serrated villous on each side, Stem hairy
384 Leaves obl ov, rugose sert. smooth dotted, Flowers in spiked whorls on one side, Bract. decid. Helmet hairy
385 Lvs. somew. rhom. ov. acum, serr. at base and apex quite ent. beneath dev. above hoary, Bract. decid. hoary 386 Leaves ovate crenate rugulose hoary, Calyx with stellate hairs, Stem decumbent
387 Leaves ov. acum. serr. beneath hoary, Spikes term. Lower whorls remote, Bract. decid. shorter than calyx 388 Leaves ovate serrate, Leaf stalks with a point on each side, Spikes imbricate, "Bract. ovate ciliated narrowed 389 Leaves sub-cordate obtuse unequally bluntly serrated, Calyx viscid villous as long as corolla
390 Leaves cordate obtuse rugose crenated hoary beneath, Calyx villous viscid as long as corolla
391 Leaves cordate rugose crenate equally serrate acute, Calyx smoothish
392 Leaves ov. serr. glaucous beneath, Racemes comp. Flowers on one side, Leaf stalks with 2 glands at base 393 Leaves cordate crenate blistered wavy at edge obtuse smooth, Bractes ovate shorter than calyx
394 Leaves cordate crenate, Flowers axillary whorled, Stem shrubby
395. Leaves cordate acute tomentose serrate, Corolla twice as long and narrower than the calyx

396 Leaves cord. acute smoothish cren. : the upper sess. whorls $6-10 \mathrm{ff}$. Helmet hairy entire the length of stamens 397 Leaves cordate crenate : stalks with 2 calli, Stem and calyx clammy with hair, Bractes ovate ciliated 398 Villous viscid, Leaves cordate arrow-headed coarsely serrated acuminated, Helmet entire
399 Leaves cord. ovate acuminate lucid serrat. downy beneath, Spikes numerous axillary and term. very dense
Calyx 5-toothed, generally 3-2.
400 Leaves linear lanceolate toothed rugose, Bract. ovate mucronate
401 Leaves linear lanceolate, Flowers nearly digynous, Cal. 2-leaved
402 Leaves obovate wedge-shaped toothletted
403 Lower leaves spatulate serrate truncated at base toothed: upper oblong nearly entire, Cal. hairy
404 Leaves obl, nearly entire hoary, Cal. hairy: of the fruit enlarged veiny with a membranous coloured limb 405 Leaves Ianceolate ovate crenulate, Whorls few-flowered, Cal. mucronate longer than bractes

and Miscellaneous Pariiculars.
genus consists of herbs or under-shrubs, the leaves of which have generally a rugose appearance, the smell aromatic, and the flowers commonly in spikes, two or three together from a bracte or leaf. They are all of easy culture, and some of them are ornamental as greenhouse plants or border flowers. The Horminum, Salvia, and Sclarea of Tournefort are included in this genus. The Sclarea or clary is derived from $\sigma \% \lambda \pi \rho o s$, stiff, and Horminum from óнош, quod ad venerem stimulat. Of $S$. officinalis there are many varieties, differing in the size, form, and color of the leaves. It was formerly in great repute in medicine as a sudorific, aromatic, astringent, and antiseptic. The Chinese use it as a tonic for debility of the stomach, and strengthening the nervous system, and prefer it for these purposes to their own tea. It is, however, discarded from our pharmacopeiæ, but still used by self-practitioners and herb doctors. In cookery it is used for sauces and stuffings for luscious meats. S. grandiflora is preferred for making tea. S. pomifera produces protuberances as big as oak galls, occasioned like them, by the puncture of an insect. In the isle of Crete, S . officinalis has the same sort of excrescences, and they carry them to market there under the name of sage-apples. S. verbenaca is a native of all the four continents, and very aromatic. A mucilage is produced from its seeds, which, put under the eyelids for a few moments, cnvelopes any sand or dust there, and brings it out ; and hence the name of officinalis christi, clear

History, Usc, Propagation, Culture,
eye or clary. The flowers of S, glutinosa are used in Holland to give a flavor to the Rhenish wines, S. Sclarea has a very strong scent, and was formerly used in medicine. A wine is made from the herb or flower, boiled with sugar, which has a flavor not unlike Frontignac. S. indica is a magmificent species, but rather tender in

406 Leaves radical obl. sub-cord. bluntly tooth. : cauline tooth cren. Whorls 6-f. Fl. horizon. a sing. fl.-st. term 407 Leaves stalked ovate lanceolate flat smooth beneath, Corolla and coloured calyx downy, Style exserted 408 Leaves lanceolate nearly entire with the stem woolly clammy
409 Villous viscid, Leaves ovate oblong toothed running down the stalk
410 Leaves cordate oblong crenated toothed eroded, Stem twiggy, Whorls remote, Helmet linear
411 Leaves cordate oblong lanceolate eroded crenated rugose hairy, Stamens shorter than corolla
412 Leaves cordate crenate toothed, Whorls nearly naked, Style lying on the lip of the corolla
413 Leaves cordate rather lobed at the side : the upper sessile, Whorls nearly naked verydistant
414 Leaves sub-cordate oblong crenate naked on each side, Helmet pilose
415 Leaves cord. ovate doubly serr. rugose woolly, Upper whorls sess. Bract. cord. mucronate shorter than calyx 416 Leaves hoary on each side rep. and uneq. tooth. : low. cord. upp. ov. Fl. in panic. Style twice as long as helmet 417 Rather wooliy, Leaves toothed : radical cordate-oblong, Bract. roundish cordate unarmed : the upper sessile 418 Leaves cordate ovate acute rugose doubly crenate smooth above pubescent beneath, Branches in bundles 419 Leaves cordate oblong crenate, Whorls many-flowered, Cal. acute shorter than the bracte
420 Stem woolly, Leaves cord. crenulate hoary beneath, Upper whorls dense sessile, Upper lip of cor. abbreviate 21 Lvs, cord. obl, cren. or cut : the upper stem clasping, Bract. nearly as long as cal. Helm. visc. long. than lip 422 Lvs, 423 Leaves cordate ovate rugose tomentose, Cal. hispid, Root tuberous
424 Villous viscid, Leaves cordate oblong rugose acutish crenulate, Bract. cordate roundish acuminate
425 Leaves cordate oblong eroded, Lear-stalks edged, Stam. as long as corolla
426 Leaves obl. cordate, Stem simple without leaves, Racemes in towers pendulous , Bract. coloured ciliate 428 Leaves cord. lanc. $\frac{1}{3}$ stem embracing uneq. cren. Bract. cord, acum, shorter than the calyx, Flowers spiked
429 Leaves cordate oblong eroded sinuated, Stem nearly without leaves, Whorls yery hairy, Stam. very long
430 Leaves cordate toothed lower repand, Bract. short acute, Cal. tomentose
431 Leaves
432 Leaves oblong cordate rugose crenated, Hairs of the calyx and stem glandular at the end
433 Leaves cord, obl. doubly cren. some coloured pointed shorter than the flower, Hairs of stem and calyx simple 435 Leaves cord, rugose biserr. Bract. corrate, Bract. the length of calyx, Lower lip of corolla reflexed 435 Leaves
437 Clammy, Red oblong eroded toothed very rugose, Bract. cordate mucronate ciliated, Cal. spiny
438 Leaves rugose cordate obl, serrate villous, Bract. coloured longer than calyx
439 Leaves oblong repand, Cal. spiny, Bract. cordate mucronate concave
440 Leaves oblong eroded with the whorls woolly, Bract. recurved somewhat spiny
441 Leaves oblong toothed angular woolly, Upper whorls sterile, Bract. concave
列 443 Leaves obtuse crenated, Upper bract. sterile large and coloured

444 Lvs, obt. obl. equal. cren. stalk. : those next the fl. stem-embrac. the low. whorls dist. Cal of the fruit reflex. 445 Leaves obl. obt. cren. stalk. Floral stem-emb. whorls 2 approxim. the term. one having 6 fl . Cal.of fruit reffexed 446 Liss. cord. acum. plait. erod. cren. ben. white with hairs, Bract. col. cord. acutelong. than cal. Sp. term. conic. 447. Leaves serrate sinuated smoothish, Corolla shorter than calyx

448 Leaves lanceolate oblong obtuse smooth, coarsely equally bluntly serrated, Cor, narrower than cal.
49 Tomentose, Lvs stalked rugose sub 3-lobed: the intermediate lobe long 450 Radical leaves lyrate toothed, Helmet very short, Stem with very few leaves hairy downwards
451 Lower leaves lyrate: upper cordate, Flowers whorled, Cal. mucronate ciliated
452 Leaves sinuate angular crenate toothed, Cal. teeth sphy with the angles and edge of the orifice ciliated 453 Leaves lyrate auricled, Stem nearly without leaves, Helmet bifid
454 Lvs cord. with spread, teeth : the low. hastat. and lyr. Whorls nearly naked, Up. lip of cor. short. cord. edged 455 Villous, Leaves ovate toothed auricled, Flowers in spiked whorls
456 Radic. lvs. cord, palm. or ent. of the stem arrow-head. lanc. uneq, tooth. Bract. reflex. short. than nodd. cal 457 Leaves hastate lanceolate unequally serrated, Stem leafy erect
458 Leaves pinnatifid rugose: Segm. lin. unequal crenated obt. Whorls many-f. Bract. roundish cordate acute 459 scabrous, Leaves pinnatifid backwards toothed, Flowers in spiked whorls
460 Lower lvs, stalked sinuated pinnatifid rugose smoothish: the upper sessile cord. Bract, short than flowers
461 Leaves serrated pinnatifid very rugose smooth, Spike obtuse, Cor. twice as long as calyx
462 Leaves very rugose woolly : the radical bipinnatifid cauline pinnatifid, Upper whorls sterile
463 Leaves pinnatifid rugose stalked, Whorls all fertile and very hairy
464 Leaves pinnated hairy, Segments of calyx subulate, Bract. leafy longer than cal. Whorls many-flowered

465 Leaves ovate and stem smooth
40io Leaves sub-cordate a little hairy, Stem roughish

unu Miscellaneous Particulurs.
severe winters. S. formosa and S . splendens are very ornamental. All the species thrive in light soil, some what rich, and are readily propagated by seeds, cuttings, and dividing the roots.

History，Use，Propagation，Culture，
respondent of Limæus：he died in 1769．Horse－weed，Amer．The species are American plants of easy cultivation．

64．Catalpa．The Indian name．Die Trompetenblume，Ger．C．syringifolia，H．K．is the Bignonia catalpa，L．； a low－spreading，rather singular looking tree，with succulent shoots easily injured by winds or severe frosts．It requires a sheltered situation and plenty of room．The leaves are large and come out late；the flowers are white，shewy，and are succeeded by long pods，but they seldom appear in this climate．One of the oldest catalpas in England is in Gray＇s Inn gardens，said to have been planted there by Lord Bacon．C．longissima is an ele－ gant upright tree，known in the West Indies by the name of French oak，and the French call it chêne－noir

05．Ghinia．In honor of an Italian botanist，named Ghini，who founded several botanic gardens．
66．Fontanesia．So named by Billardiére，in honor of M．Desfontaines，the excellent professor of botany at the Jardin du roi at Paris．It is rather a tender shrub，requiring shelter in severe weather．It grows in com－ mon garden soil，and is increased by layers or by cuttings in sand under a hand－glass．

67．Linociera．Named after Geoffroi Linocier，a French physician．A tropical genus of shrubby plants，pro－ pagated by cuttings，and of little beauty in a cultivated state．
68．Ancistrum．From $\alpha y \hbar 5 \rho o v$, a hook．Its calyx is terminated by little hooks．These are small herbaceous plants with pretty foliage，but no beauty in their flowers．They are only cultivated as objects of curiosity，and are seldom seen．
69．Ornus．In Greek，oftyas，from opas，a mountain．The tree grows on mountains，La Frene a fleurs，Fr． Die Bluthende Esche，Ger．；and Frassino florido，Ital．O．europa，P．S．is the Fraxinus ornus，L．O．rotun－ difolia，or the manna ash，abounds in the skirts of the mountains in Calabria．From the middie of June to the end of July the manna gatherers make an incision across the bole of the tree，which they deepen the second day，inserting a maple leaf，so as to form a sort of cup to receive the gum as it distils from the incision．Some－ times bits of reed or twigs are applied，on which the manna oozes out，and drying with the sun，forms tubular

467 Leaves oblong acute at both ends, Stem smooth, CaI. teeth very short, Flowers terminal naked 468 Leaves sub-rhomboidal ovate, Cal. teeth bristly longer than the tube, Panicle leafy, Stem much branched 469 Leaves ovate cordate rugose, Flowers tetrandrous

470 Leaves cordate flat
471 Leaves oblong undulated
472 Fruit with 4 spines, Leaves smooth
473 Leaves ovate-oblong pointed at each end, Flowers racemose
474 Racemes compound and decompound, Flowers sessile in threes, Petals subulate
475 Leaflets oblong cut, Flower-stalks like scapes, Spikes elongated prickly, Stems half under ground
476 Leaves linear-lanceol. sub-pinnatifid hairy beneath, Spikes cylindrical, Stem erect
477 Leaves oblong and a little wedge-shaped serrated silky beneath, Spikes globose, Stems creeping
478 Leaflets oblong and obovate serrated smoothish, Spikes round, Stem decumbent
479 Leaves remote, Leaflets wedge-shaped serrated silky beneath, Spikes globose, Stem decumbent
480 Leaves 3-5-parted, Segments linear-villous beneath, Spikes oblong, Stem half under ground
481 Leaffets ovate-oblong serrated silky beneath, Spikes globose, Stem creeping
482 Leaflets oval crenate and cut smonth above hoary beneath, Spike terminal cylindrical, Stem decumbent
483 Leaves lanceolate attenuated stalked serrated
484 Leaves roundish acute doubly serrated nearly sessile
485 Leaflets oblong tapering acuminate acutely and unequally serrated, Male flowers with a corolla
486 A plant like the Acanthus. Flowers in whorls
487 Stem pubescent erect, Leaves ovate acute denticulate sub-pubescent
488 Stem erect simple nearly smooth, Leaves cordate with spreading teeth acuminate
489 Stem much branched erect smooth, Leaves cordate smooth shining
490 Upper leaves toothed and angular, Flowers in heads
491 Invol. 4-lvd. leafl. broad ov. smth. on both sides much short. than the head, Lvs. lin.-stalk. 1-nerv. Cor. silky 492 Invol. 4-lvd, leafl, lanceol. ovate acute smooth on both sides, Leaves lanceol. lin. Cor, hairy on its lower half 493 Leaves oval-obl, flat pubesc, beneath, Floral lvs. longer than the head, Cor. cylind. deciduous, Fruit berried 494 Lvs. smooth on both sides lin. lanc, twice as narr. as the foral lvs. longer than the few-fl. head, Cor. smooth

495 Culm round, Corymbs dense, Panicle contracted, Flowers in bunches
496 Leaves uniform toothed shorter than the scape in seed, Scape and leafstalks smooth

## and Miscellaneous Particulars.

pieces called manna in Cannali, which being reckoned more pure, sells higher by one-third than the manna in T'azzeti. Manna is a concrete mucilaginous juice, mild, and slightly nauseous. It seems to have no relation to that which nourished the Hebrews in the desert, being, as Rozier observes (Dict. d'Agr.), much more likely to have purged than nourished them. The Fraxinus virgata, P.S. also affords manna, but from no other species of ornus can it be procured. The Ornus floribunda has lately been discovered in Nepal, where it is called kanga and tahasee.
70. Morina. In memory of Lewis Morin, a French botanist, and son of Peter Morin, a florist celebrated in the 17 th century. This plant is of very rare occurrence. It is not unlike the common acanthus, but more beautiful. Propagated by seeds.
71. Circaea. Poetically named after the enchantress Circe. The genus grows in damp shady places where shrubs fit for incantations may be supposed to be found. The Greeks had a plant named circæa, All the species are easily cultivated, and are curious on account of their singular flowers. C. lutetiana has been found in Nepal
72. Fedia. A name of Adanson's, which, like many others of the same author, has probably no meaning. The genus has been very properly distinguished from Valeriana by Decandolle, as well as from Valerianella, with which it has recently been again confounded. A weed-like annual is the only species yet in our gardens.
73. Pimelea. From $\pi \iota \mu \varepsilon \lambda \eta$, fat; but if so, it should be written Pimelæa. A real and extensive genus of plants, natives of the southern hemisphere. Many of the species are from N. Holland, and are chiefly known by the brief descriptions of Mr. R. Brown.
74. Cladium. From zhळסоs, a branch or twig. A tall sedge-like plant, referred by Linnæus and his school to Schœnus. C. germanicum is the only European species; it is the Schonus mariscus of English botany. The others are chiefly from N. Holland.
75. Gunnera. After Ernest Gunner, bishop of Norway, of which country hepublished a Flora. A singular plant, cultivated merely as an object of curiosity. It likes a moist peat soil, and the temperature of a cool greenhouse.

## TRIGYNTA.

Shrubby.
500 Leaves broad-lanceolate pointed coriaceous, Berries stalked
501 Lvs, elliptic lanc. attenuated very smooth dotted shining above at the base unequal, Spikes recurved at tips
502 Leaves ovate oblong or elliptic acuminate unequal at the base rough on each side, Spikes axillary uncinate 503 Leaves ovate oblong many-nerved acuminate smooth unequal at base, Leaf stalks margined, Joints equal
504 Leaves elliptic oblong acuminate many-nerved unequal at the base, Joints knotty
505 Branches round hairy, Leaves ovate oblong above rough : veins beneath and stalks hispid
506 Leaves ovate oblong 5 -nerved rugose on each side smooth equal at the base
507 Leaves ovate attenuated 7-nerved, Stalks 2-toothed
508 Leaves broad ovate acuminate 7-nerved coriaceous smooth, Joints knotted
509 Leaves broad cordate 5 -nerved at the base unequal, beneath discoloured, Spikes lax with remote flowers
510 Leaves cordate acuminate 5-9-nerved very smooth equal to the leaf stalks
511 Leaves cordate acuminate 9-11-nerved veiny rather villous, Leaf stalks partly winged
512 Leaves cordate oblong acuminate about 7-nerved unequal at the base
513 Lower leaves cordate stalked 7-nerved: upper cordate oblong sessile 5-nerved
514 Leaves peltate round cordate many-nerved obtuse sub-repand, Spikes in umbels
515 Leaves roundish cordate acute many-nerved, Nerves and stalks villous, Spikes in umbels
516 Leaves lanceolate ovate nerved, Spikes short
517 Leaves ovate lanceolate tomentose, Stem arborescent
518 Leaves ovate lanceolate acuminate smooth 3-nerved
519 Leaves lanceolate ovate rugose, Nerves alternate
Stem fleshy.
520 Leaves ovate acute obsoletely 3-nerv. rather folded together at the base, Stalks ciliated, Spikes term, solitary
521 Leaves stem-clasping broad lanceolate narrowed downwards many-nerved, Stem simple erect
522 Leaves obovate very obtuse, Flower-stalks terminal branched, Stem and branches rooting
523 Leaves obovate nearly retuse edged with red, Spike terminal solitary, Stem decumbent rooting
524 Leaves wedge-shaped about 7-nerved, Spikes terminal conjugate, Stem rooting nearly erect
525 Leaves oblong lanceolate attenuated 5 -nerved, Spikes axillary, solitary, the terminal in pairs, Stem winged
526 Leaves lanceolate ovate 5-nerved acute at each end, Spikes terminal 2 or 3 together, Stem nearly erect
527 Leaves ovate acuminate 5 -nerved, Spikes conjugate erect, Stem branching rooting
528 Leaves peltate cordate ovate acute, Stem creeping
529 Leaves cordate acute, Spikes lateral and terminal, Stem procumbent
530 Leaves oblong nerveless opposite spikes axillary solitary, Stem pubescent upright
531 Leaves oblong acute nerveless opposite with the erect stem villous
532 Leaves ternate roundish, Stem creeping
533 Leaves 4 together sub-sessile oblong nerveless, Spikes terminal, Stem erect
534 Leaves 3 and 4 together oblong 3-nerved smooth coriaceous, Spikes terminal solitary
535 Leaves 3 and 4 together elliptic lanceolate 3-nerved with the upright stems villous
536 St, erect round smth. Lvs. $4-6$ togeth. ses. lanc. atten. at base 3 -nerv, very smth. Sp. ter, very long sol, or double
537 Leaves 3 and 4 together roundish rhomboidal stalked 3-nerved pubescent, Branches erect
538 Leaves 4 together wedge-shaped emarginate sub-sessile, Spikes solitary, Stem erect
539 Very fragrant, Leaves 4,5, and 6 together sub-sessile reflexed sub-emarginate, Spikes terminal about 4
540 Leaves 3 and 5 together oblong acuminate 3-nerved smooth, Stem erect
54! Hoary with down, Leaves alternate thick round-ovate with a small blunt point, very cordate at the base
542 Leaves obovate rounded stalked very thick green naked
543 Leaves about 4 together roundish convex beneath and coloured, Spikes terminal and axillary sub-solitary

and Miscellaneous Particulars.
planted, and afterwards staked with any rough barked wood, on which the plants climb and attach themselven much in the manner of our five-leaved ivy (Ampelopsis). In Sumatra, Marsden informs us (Hist. 107.), a tree called the chinkareen is planted for the support of the pepper plant, as the common maple and flowering ash is for the vine in Italy. The shoots bear in the third year; the flowers appear in June, and the berries are ripe, and of a blood-red in September. The shoots are then cut down to the ground, and the berries gathered, dried in the sun, and sorted. In three or four years more the shoots have attained full growth, and another crop is ready.
P. amalago, longum, and various other species afford berries differing very little in quality from those of P nigrum, and sometimes mixed with, or substituted for them.
P. betle affords the betel leaf of the southern Asiatics, which
nut (thence commonly called the betle-nut), and a littles, which serves to enclose a few slices of the areca chew to swe commonly called the classes sweeten the breath, strengthen the stomach, and ward off the calls of hunger, as the European working of betel in toacco. It is deemed the extreme of unpoliteness in the east to speak to a superior without a quid an old age, by staining them black with antimony. Such is the consumption of betel in the east, that it occa sions a branch of commerce nearly ws extensive as . Such is the consumption of betel in the east, that it occaAll the species of pepper intrody as extensive as that of tobacco in the west
All the species of pepper introduced in our stoves grow frecly in loam and peat, require but little water, and
are readily propagated by cuttings.

## Class III. - TRIANDRIA. 3 Stamens.

This class, which is larger than the two preceding, contains most of the genera of three considerable and very natural orders, the Irideæ, Cyperaceæ, and Gramineæ. The first are chiefly bulbous-rooted sword-leaved plants, with brilliant but transient flowers; the second, sedgy grass-like plants, more curious than useful; and the third, the proper grasses, an order which contributes more extensively and effectualiy to the support of man and domestic animals than any other, and, unless we except Lolium temulentum, containing no poisonous plant. The genera of the grasses, Sir J. E. Smith observes, are not easily defined. Schreber and Dr. Host among the Germans, and Stillingflect and Curtis, and more recently, Mr. R. Brown, in this country, have paid much attention to the order; but it is among the French that the greatest improvements have been made in the arrangement and distribution of the genera. The principal graminologists in that country have been Messrs. Desvaux, Palisot de Beauvois, and Kunth, each of whom has divided the Linnean genera into many others; the greater part of which have been admitted by other botanists, and are consequently adopted here. It must, however, be confessed, that if much has been done in remodelling the grasses, yet more remains to be effected; and that much more perspicuity and clearness of definition will be required before their arrangement can be said even to approach perfection. In describing the essential characters, the phraseology of the continental botanists has been adopted. This not being very familiar to readers in this country, the following explanation of terms may be useful.

## The parts here called Gluma are the Calyx of Linnæus.

Palea . . . Corolla.
Scale : : Nectary.
The terms calyx and corolla applied to the floral envelopes of grasses are improper, as they are not analogous to those organs in other plants, but are rather to be considered as a form of Bracteæ, as are also the inner scales, called Nectarium by Linnæus. It has been considered by some writers, proper to place all the grasses in Triandria, without reference to the number of their stamens; but this is manifestly improper, as the whole merit of the artificial system depends upon its principles being closely followed: The grasses not in this class are to be found in Monandria, Diandria, Hexandria, and Polygamia. The grasses, in an ceconominal point of view, have been scientifically experimented on by Sir H. Davy, and Mr. Sinclair, the duke of Bedford's gardener at Woburn.

Galaxia and Ferraria, which Persoon has placed in this class, we have, with Willdenow, placed in Monadelphia. Tigridia will also be found there. The following plants are Triandrous, but as they belong to very natural genera, botanists have deemed it better not to separate them.

MONOGYNIA. Narcissus triandrus. Juncus conglomeratus and effusus. Rivina brasiliensis, and some species of Amaranthus, \&c. Galium trifidum, some Asperulas, Melothria, Laurus triandra, Fagara spinosa and acuminata, Hirtella triandra, Tradescantia multiflora.
DIGYNIA. Tripsacum hermaphroditum, some species of Ehrharta, \&c.
TRIGYNIA. Tillæa muscosa, Elatine triandra, Stellaria media, some species of Xanthoxylum, Triplaris americana, \&c.

Order 1. MONOGYNIA.

3 Stamens. 1 Style.

## 1. Flowers with Calyx and Corolla distinct; or with a trifid Corolla only.

78. Valeriana. Cal. very small, finally enlarged into a feathery pappus. Corolla monopetalous, 5-lobed, regular, gibbous at the base. Capsule 1-celled.
79. Patrinia. Cal. very small, finally enlarged into an irregularly and obsoletely toothed rim. Corolla monopetalous, 5-lobed, regular, gibbous at the base. Capsule 3-celled, supported on one side by an oval membranous bractea. Stamens variable. ( 3 or 5 .)
80. Valerianella. Cal. very small, finally becoming a straight rim. Cor, monopetalous 5-fid, regular. Capsule 3 -celled.
81. Calymenia. Cal, 5-fid campanulate. Cor, funnel-shaped. Nut 1-seeded, surrounded by the enlarged calyx.
82. Laeflingia. Cal. 5-leaved, the leaves 2-toothed at the base. Cor. of 5 petals, which are very minute and connivent. Stigma 3-ple. Caps. 1-celled, 3-valved, many-seeded.
83. Hippocratea. Cal. 5-leaved, very small. Pet. 5 dilated at the base, hooded at the end. Nut fleshy, bearing the stamens. Caps. 3, compressed, 2-valved, opening in the middle, 1-celled, with 25 compressed winged seeds.
84. Cneorum. Cal. 3-4-toothed, persistent, small. Pet. 3-4 equal. Stigma 3-fid. Drupes 3 or 4 clustered, dry.
85. Comocladia. Cal. 3-parted. Pet. 3, larger than the calyx. Drupe with 3 spots at the end, and a membranous 1 -seeded nut. (Stamens and petals vary to 4.)
86. Xyris. Cal, ふ.valved, cartilaginous, clustered in a head. Cor. 3-petaled, equal, Caps. 1-3-celled, 3-valved. Stigma 3-fid,
87. Callisia. Calyx 3-leaved. Petals 3. Anthers double. Capsule superior, 2-celled, 2-seeded, compressed. Stigmas 3, finely divided.
88. Commelina. Cal, 3-leaved. Pet. 3. Filaments 3 or 4-sterile, furnished with crossing glands. Caps. 2-3celled. Seeds fixed to the valves,
89. Aneilema. Like Commelina, but no involucrum. Stamens 6. Anthers 3, sometimes 2-4, dissimilar.
90. Cartonema. Cor. persistent: the 3 outer leaves calycine. Stamens persistent, veardless. Seeds 2.
91. Flowers with a 5-parted Calyx, and no Corolla.
92. Ortegia. Cal. 5-leaved. Stigma headed. Caps. 1-celled, 3-valved at the end. Seeds many, affixed to the bottom of the capsule. Stigma 1-3.
93. Polycnemum. Cal. 5-leaved. Seed 1, in an utriculus.
94. Flowers 6-parted, coloured : the Calyx and Corolla not distinct.
95. Crocus. Spatha usually 2-valved. Flower funnel-shaped, regular: the outer segments largest. Tube very long, partly under ground. Stigma deeply trifid, with convolute segments.
96. Witsenia. Flower tubular, with a 6 -parted limb. Stigma slightly trifid or emarginate. Caps. 3-celled, many seeded.
97. 1xia. Spatha 2-valved. Flower with a slender tube and regular limb. Stigmas 3, narrow, recurved. Caps. glowose, ovate.
98. Trichonema. Spatha 2-valved. Flower with a very short tube and an equal regular limb Filaments pubescent. Stigmas 3, 2-parted.
99. Geissorhiza. Spatha 2-valved. Flower tubular, with a 6-parted spreading regular limb. Style inclined. Caps, oval, 3-cornered.
100. Hcsperantha. Spatha 2-valved. Flower tubular, with a 6-parted regular limb. Stigmas 3, divided as far down as the tube. Caps, oblong 3-cornered.
101. Sparaxis. Spatha 2-valved, scarious, membranous, torn at the end. Flower tubular. Stigmas S, recurved. Caps. obiong, globose.
102. Tritonia. Spatha 2-valved. Flower tubular, with a 6 -parted nearly regular limb. Stigmas 3, spreading. Seeds neither winged nor berried,
103. Watsonia. Spatha 2valved. Flower tubular, with a 6-parted limb. Stigmas 3, filiform, 2-parted, with recurved segments. Caps, cartilaginous, many-seeded.
104. Babiana. Spatha 2-valved, the inner valve 2-parted. Flower tubular, with a 6-parted limb. Stigmas 3, spreading. Seeds berried.
105. Layeyrousic. Hower hypocrateriform. Tube longer than the 6-parted limb. Stigmas 3, 2-parted. Caps. membranous, many-seeded.
106. Melaspherula. Spatha 2-valved. Flower nearly divided into 6 petals : the segments pointed equal. Stignas 3, recurved. Caps, 3-lobed,
107. Gladiolus. Spatha 2valved. Flower tubular, with a 6-parted irregular limb. Stamens ascending. Stigmas 3. Seeds winged.
108. Anomatheca. Spatha 2-valved. Flower hypocrateriform, Stigmas 3, 2-parted. Caps. frosted over with little warts.
109. Antholyza. Spatha 2valved. Flower tubular, with a ringent differently formed limb. Stigmas 3, simple. Seeds nearly round.
110. Xiphidium. Flower inferior, 6-petaled, regular. Caps. 3-celled, many-seeded.
111. Leptanthus. Flower monopetalous, with a very long slender tube, a 6-parted limb, and nearly equal segments. Stigma simple.
112. Wachendorfia. Flower inferior, 6-parted, irregular. Caps. 3-celled. Seeds solitary.
113. Hcemodorum. Flower 6-parted, persistent, smooth. Stamens attached to the base of the inner segments of cor. Ovarium 3-celled. Cells 2-seeded. Stigma 1. Caps. $\frac{1}{2}$-superior, 3-lobed, 3-celled. Seeds peltate, edged.
114. Aristea. Flower superior, 6-petaled, regular; after flowering twisted spirally and persistent. Caps. 3-celled, many seeded.
115. Dilatris. Flower superior, 6 -petaled, regular. One filament shorter than the others, and with a larger anther. Stigna simple. Caps. 3-celled. Seeds solitary.
116. Brodicea. Flower inferior, tubular, with a 6-cleft regular limb, and a 3-leaved corona in the orifice, Caps. 3-celled, many seeded.
117. Iris. Flower 6-parted : every other division reflexed. Stigmas shaped like petals.
118. Morae. Flower 6-petaled; after flowering involute above, spirally twisted beneath, finally falling off, Caps. many-seeded.
119. Marica. Flower 6-parted, or of 6 petals: the 3 outer segments largest, the inner connivent and very much smaller. Stigma like a petal, 3-fid: its segments undivided. Caps. 3-celled.
120. Pardanthus. Flower 6-petaled, regular, equal. Caps. many-seeded. Seeds attached to a central loose receptacle.

## 4. Flowers glumaceous

$\alpha$, Leaves with an entire Sheath. Sedges.
119. Schenus. Spikelets few-flowered, distichous : the lower scales empty, the upper enclosing flowers. No bristles under the ovarium.
120. Rhynchospora. Spikelets few-flowered, slender : the lower nearly empty, the upper enclosing flowers. Bristles under the ovarium.
121. Fimbristylis. Spikelets imbricated in all directions, many-flowered, none of the scales empty. Style jointed at the base, and deciduous. No bristles under the ovarium.
122. Isolepis. Spikelets imbricated in all directions, many-flowered, none of the scales empty. No bristles under the ovarium. Style not jointed at the base, and deciduous.
123. Scirpus. Spikelets imbricated in all directions, many-flowered, none of the scales empty. Bristles under the ovarium. Style not jointed at the base, and deciduous.
124. Elcoocharis. Spikelets imbricated in all directions, many-flowered, none of the scales empty. Bristles under the ovarium. Style jointed at the base, and deciduous,
125. Eriophorum. Glumes chaffy imbricated in all directions. Seed surrounded by very long dense wool.
126. Trichophorum. Spikelets nearly ovate, imbricated in all directions. Bristles about the seed usually six, capillary, finally very much lengthened and exserted.
127. Cyperus. Spikelets in two ranks, imbricated; nearly all the scales enclosing flowers. No bristles under the ovarium. Style deciduous, not bulbous.
128. Papyrus. Spikelets many-flowered. Glumes imbricated in two rows, 1-flowered. Style 3-fid. Scales 2, membranous, contrary to the glumes. No bristles beneath the ovarium. Seed 3-cornered.
129. Kyllinga. Spikelets I-flowered. Glumes 4, imbricated in two rows, compressed: the 2 lower which are smaller and the upper one empty; the intermediate similar to the upper, and including a naked hermaphrodite flower. Style bifid. No bristles under the ovarium. Seed lenticular.
130. Mariscus. Spikelets few-flowered. Glumes imbricated in two rows, the lower empty. Stamens sometimes 2. Style trifid Neither scales nor bristles below the ovarium. Seed triangular.
$\beta$. Leaves with a split sheath, and a membranous ligule. True grasses.
131. Remirea. Spikelets 1-flowered, with imbricated scales; the outer ones nerved, the upper which bears the flower enclosed in them and unlike them. No bristles beneath the ovarium. Seed oblong, enclosed in the uppermost scale become thickened and corky.
132. Lygeum. Flowers 2 or 3 together, with two valved glumes, at the base united into a 2 celled villous pericarpium. Involucrum a convolute spatha.
133. Cornucopia. Involucre 1-leaved, cup-shaped or funnel-shaped, many-flowered. Glumes 2-valved, united at base, mitre-formed, equal. Palea 1, bladder-like, split on one side, with a beard below the middle. Stigmas long. Seed not furrowed. Flowers in a head.
134. Cenchrus. Involucrum 1-3-flowered, many parted, bristly without, finally hardened. Glume 2-flowered, 2-valved: the outer valve smallest. Florets dissimilar : the outer male or neuter, the inner hermaphrodite. No scales.
135. Pennisetum. Involucrum double, composed of many bristles: the outer unequal, the inner pinnated, bearded. Spikelets 2-3-5. Glume 2-valved, unequal. Lower floret male, upper hermaphrodite, both sessile. Paleæ nearly cartilaginous. Spike compound, with sessile spikelets.
136. Spartina. Glume 3-valved, 1-fowered, unequal, keeled, very acute. Paleæ 2, beardless, bifid, emarginate and toothed, shorter than the glumes. Scales fringed. Style very long. Seed loose, covered with the paleæ. Spikelets 1 -sided, inserted in a double row. Spike compound.
137. Nardus. Glume 1-valved, 1-flowered. Palea 1. Stigma simple. Seed covered by the palea.
138. Oryzopsis. Glume 2-valved, 1-flowered, membranous, a little longer than the hardened palex. Paleæ 2 , the lower villous at the end with a jointed beard, the upper entire. Scales 2, linear, the length of the ovarium. Panicle nearly simple and loose.

Order 2. DIGYNIA.
3 Stamens. 2 Styles.

1. Inftorescence spiked or panicled. Spikelets either solitary, in pairs, or several together, one or more usurlly 2-flowered, one of the flowers being sterile or of only one sex. Glumes usually of a thinner texture than the Palece, which are more or less cartilaginous, the lower one half enfolding the upper, and cither beardless or occasionally bearded; neither of them with a feel. (Panicea.)
2. Paspalum. Glume 2-valved, 1-flowered, closely pressed to the two plano-convex palex. Seed coated with the paleæ. Flowers spiked, attached to one side of the toothed rachis.
3. Azonopus. The inflorescence digitate. Spikelets simple. Otherwise, as Paspalum.
4. Milium. Glume naked, beardless, 2-valved: the valves concave, larger than the palex, which are two, concave and equal. Seed coated with the indurated paleæ.
5. Knappia. Glume 1-flowered, 2-valved, truncate, beardless. Palea one, torn, the divisions setigerous and united at the base, enfolding the stamens and pistillum. Flowere alternate in a flexuose rachis. Seed loose.
6. Digitaria. Inflorescence digitate or fascicled. Spikelets 1-sided, flower-stalks 2-, or many-fowered, Glume 2-valved, the lower valve very minute. Of the lower neuter floret the paleæ membranous. Of the upper hermaphrodite foret the paleæ subcoriaceous, hardened. Seed slightly furrowed,
7. Panicum. Glume 3-valved: valves unequal, the outer being very small. Paleæ two, concave, equal, beardless. Seed coated with the hardened palex. Panicle scattered and loose.
8. Setaria. Has the same character as Panicum, except that the panicle is spiked.
9. Echinochloa. Has the character of Panicum, except that the panicle is composed of alternate spikelets, and the third valve of the glume is bearded.
10. Orthopogon. Has the character of Echinochloa, except that both the intermediate and third valves of the glume are bearded.
11. Penicillaria. Involucrum bristly: the bristles equal, pinnated, bearded. Glume 2-valved, very small, membranous. Lower floret male, upper hermaphrodite : the paleæ subcartilaginous and entire. Anthers villous at the end. Spike compound, cylindrical, with stalked involucrated spikelets.
12. Lappago. Glume 2-valved, valves unequal : the lower very minute, membranous, the upper cartilaginous, very large, with soft prickles. Paleæ 2-valved, membranous, shorter than the glume. Scales very small, fringed. Panicle simple spike-shaped; the branches 3-flowered.
13. Inforescence panicled. Spikelets solitary, 1-flowered. Glumes membranous, the lower Palea coriaccous, bearded, enfolding the upper, which has not two Keels. (STIPAcea.)
14. Stipa. Glume 2-valved, 1-flowered; membranous, longer than the two cartilaginous palex, of which the lower is convolute, with a long beard at the apex ; upper entire. Beard jointed at the base, deciduous. Scales oblong, entire. Seed furrowed. Panicle almost simple, lax.
15. Inflorescenoe panicled, sometimes contracted into the form of a spike, Spikelets solitary, 1-flowered. Glumes and Palea of nearly similar texture, most usually with a Keel. Lower Paleae either bearded or beardless, the upper never with two Keels. (Agrostidea.)
16. Muhlenbergia. Glume 2-valved: valves very minute, fringed, three times as short as the paleæ, the lower of which has a bristle. Scales ovate, obliquely truncate, gibbous. Seed naked, not furrowed. Panicle nearly simple, contracted or spreading.
17. Charturus. Lower valve of the gluma with a long bristle, upper acute. Paleæ membranous, the lower valve trifid, upper bifid. Flowers spiked, inserted into the elongated teeth of the rachis.
18. Lagurus. Glume 2-valved, 1-flowered, each valve ending in a villous beard. Outer paleæ with two terminal beards, and a third, which is dorsal and twisted back. Panicle spike-shaped, ovate, hairy.
19. Polypogon. Glume 2-valved, 1-flowered: valves nearly equal, obtuse at the end with a long bristle, much longer than the somewhat cartilaginous palee. Lower palea below its end, which is entire, with a straight short tender bristle, upper bifid, toothed. Panicle contracted, like a spike.
20. Gastridium. Glume 2valved: valves ventricose at the base, 3 times as long as the hardened coriaceous paleæ. Paleæ2, the lower 3-4-toothed with a bristle under the end, the upper bifid, toothed. Panicle compound, contracted like a spike.
21. Agrostis. Glume naked, beardless, 2-valved : valves concave, longer than the paleæ, which are 2, and enclose the seed.
22. Trichodium. Glume 2-valved, 1-flowered. Palea one, shorter than the glumes, bearded, and supported at the base by one or two fascicles of hairs. Seed loose, covered by the palea.
23. Tristegis. Glume naked, 3-valved: valves concave, the outer very small, the intermediate longer than the paleæ, the third bearded. Paleæ 2, concave, equal, obtuse, beardless. Seed inclosed in the paleæ.
24. Sporobolus. Glume naked, beardless, 2-valved: valves concave, much shorter than the palex, which are two, concave, nearly equal, beardless. Seed not inclosed in the palea,
25. Airopsis. Glume 2-flowered: valves nearly equal, navicular, longer than the florets. Lower paleæ trifid at the end, upper entire. Seed loose, not furrowed. Panicle contracted, compound.
26. Cinna. Glume naked, beardless, with 2 concave valves shorter than the paleæ, which are 2, nearly equal, concave, with long points : the outer one being bearded or beardless. Seed enclosed in the paleæ.
27. Psamma. Glumes nearly beardless. Palees under the end emarginate, mucronate, shorter than the glumes. Scales 2, subulate. Style 3-parted. Seed turbinate. Spike compound, erect, cylindrical.
28. Crypsis. Glume 2-valved, I-flowered, compressed, unequal. Paleae 2, unequal, longer than the glume. Seed loose, covered by the palex.
29. Alopecurus. Glume 2-valved, 1-flowered : valves somewhat equal, connate, distinct. Paleæ united into a bladder-like glume split on one side, below the middle (generally), bearded. Scales linear, entire. Spike com pound, contracted, without involucrum, branches very small, branching.
30. Phleum. Glume 2valved, naked, with a point or little beard out of the nerve at its back : valves navicular, including the palex, which are 2, navicular and beardless. Beard of the glume lengthened, Second floret sessile.
31. Achnodonton. The character of Phleum, except that the beard of the glume is very minute.
32. Chilochloa. The character of Phleum, except that the second floret is stalked.
33. Phalaris, Glume 2-valved, naked, beardless : the valves navicular, inclosing the paleæ, which are two, and navicular also, beardless and naked at the base, but supported by hairs or accessory glumes.
34. Inflorescence panicled. Spikelets solitary, 2 or many-flowered. Glumes with a keel. Paleae of nearly the same texture as the glumes, the lower carinate or concave, always bearded, the upper with two kecls. (Bromea)
35. Corynephorus. Glume 2-flowered. Valves membranous, longer than the florets, Lower palea entire, having at its base a beard, jointed in the middle, woolly, twisting and small below, clavate above; upper bifidtoothed. Panicle compound.
36. Aira. Spikelets slender. Glume 2-flowered, rarely 3-flowered, beardless, 2-valved, equal to the florets or shorter. One of the florets on a stalk. Paleæ 2, equal, enclosing the seed when ripe,
37. Avena. Glumes membranous, 2-7-flowered, longer than the florets. Lower palea twice torn, or, with the upper, bifid-toothed, sometimes eroded, having at the back a plaited twisted beard. Scales ovate. Seed coated, furrowed. Panicle compound, loose.
38. Trisetum. Lower palea with 2 bristles and a tender flexuose beard above the middle of its back. Scale anceolate. Other characters of Avena.
39. Danthonia. Lower palea 2-toothed, with a plaited twisted beard from between the teeth, upper obtusely truncated. Seed loose, not furrowed. Panicle simple. Other characters of Avena.
40. Gaudinia. Glume unequal, obtuse. Lower palea bifid-toothed, bearded at the back above the middle: the bearded twisted and plaited. Upper palea $2-4$ toothed. Seed coated, furrowed. Spikelets sessile, alternate, with 9-11 2ranked flowers.
41. Arundo. Glume naked, beardless, 2-valved : the valves wrapping up the paleæ which are 2-bearded and surrounded by bristles. Seed inclosed in the palea.
42. Chrysurus. - Neuter spikelet. Glume linear, subulate, with remote florets. Paleæ 1, sterile. Hermaphrodite spikelet, 1-flowered. Glumes subulate, linear. Floret stalked. Lower palea below its end, which is entire, setigerous, the upper entire. Seed with two beards, not furrowed. Panicle compound, branching.
177 Seslcria. Common involucrum many-leaved : the leaflets sometimes deciduous. Glume 3-4-flowered.

Valves unequal, shorter than the stalked florets. Lower palea irregularly 2-toothed, setigerous. Scales longer than the ovarium, subulate. Spike compound.
178. Cynosurus. Involucrum I-leaved, with pinnatifid divisions, containing two spikelets. Glume $4-5-$ flowered, shorter than the florets. Lower palea very acute, upper bifid-toothed. Scales hairy. Seed coated, furrowed. Spike compound.
179. Köleria. Spikelets compressed. Glume 2 or 3-flowered, beardless, 2-valved: the valves shorter than the lowest floret. Paleæ 2, the outer beardless or bearded under the point.
180. Dactylis. Many spikelets heaped in a head, 1-sided. Glume 2-7-Howered. Lower palea under the end, which is emarginate, setigerous, upper bifid, toothed. Scales hairy. Seed loose, not furrowed. Panicle compound with short branches.
181. Glyceria. Spikelet slender. Glume 5-7-flowered. Valves 2, truncate, with transparent membranous edges, shorter than the florets. Lower palea eroded or many-toothed, navicular, embracing the upper, which is bifid-toothed. Scales connate. Seed furrowed. Panicle nearly simple.
182. Festuca. Glume beardless, 2valved: valves nearly equal, shorter than the lowest floret. Paleæ 2, the outer one bearded at the end. Seed inclosed in the paleæ.
183. Mygalurus. Glume 1 or 2valved, many-Howered, shorter than the spikelet: one valve very small. Paleæ 2, one of them bearded near the end. Seed inclosed in the paleæ.
184. Bromus. Glume 3-20-flowered. Valves shorter than the florets, which are imbricated in two rows. Lower palea cordate, emarginate below the end, sometimes torn in two, with a straight beard. Scales ovate, smooth. Seed coated, furrowed. Panicle compound.
185. Brachypodium. Spikelets stalked, alternate in each tooth of the rachis. Stalks broad and thick. Glume 3-15-flowered. Valves shorter than the florets. Paleæ entire, lower setigerous at the end, upper bluntly truncated, generally edged with stiff reflexed hairs. Scales pilose. Seed coated, furrowed,
186. Uniola. Spikelets compressed. Florets imbricated in two rows, the lower only abortive. Glume S-20-flowered, shorter than the florets. Lower palea navicular at the end, abruptly cut off and m. cronate between the lobes, the upper subulate, somewhat bifid-toothed. Scales bifid. Seeds turbinate, with two horns, not furrowed. Panicle compound, loose.
187. Tricuspis. Glume 5-7-flowered. Valves navicular, shorter than the forets. Lower palea bifid-toothed, between the teeth and on each side mucronate : the upper truncate, almost emarginate. Seed 2-horned.
188. Diplachne. Glume 7-9-flowered: the upper valve mucronate at the end. Lower palea twice torn, with a bristle beneath the divisions, upper sub-truncate, emarginate. Seed not furrowed. Panicle simple, much branching. Branches alternate, filiform.
189. Ceratochloa. Glume 12-18-flowered. Valves shorter than the florets. Palea bifid-toothed : the lower mucronate between the teeth. Ovarium 3-horned. Seed coated, furrowed, 3-horned. Panicle nearly simple. Spikelets compressed. Florets imbricated in two rows.
190. Schismus. Glume 3-6-flowered. Valves the length of the florets, or longer. Lower palea cordate, emarginate, its rib extended between the lobes into a filiform mucro, the upper entire. Seed obtuse, nearly furrowed. Panicle simple, contracted, spike-shaped.
191. Triodia. Glume 3-5-flowered. Valves navicular, longer than the florets. Paleæ bifid-toothed : lower with a thick tooth-shaped mucro between the teeth. Scales lanceolate, smooth. Ovarium with a bifid diverging beak.
192. Beckmannia. Spikelets 1-sided, 3-5-flowered. Glumes unequal, navicular, with a little stalk at the base, obtuse at the end, spatulate, nearly the length of the forets. Paleæ nearly equal. Scales lanceolate. Seed loose, not furrowed. Spike compound. 3 spikelets in each tooth of the rachis.
193. Melica. Glume unequal, 2-5-flowered, membranous, nearly the length of the florets, of which the upper are incomplete, abortive and stalked. Scales truncate, fringed. Seed loose, not furrowed. Panicle simple or compound.
194. Molinia. Glume 2-4-flowered, unequal, Paleæ conical, lanceolate, acute, much longer than the glume, the upper barren and abortive, or often in its place, a formless rudiment, Scales subtruncate. Seed with two points from the remains of the style, with a broad furrow. Panicle compound. Spikelets slender.
195. Briza. Glumes navicular, compressed, nearly cordate at the base, many-flowered (3-14), shorter than the florets which are imbricate in two rows. Lower palea cordate at the base, embracing the upper, which is nearly round and much shorter. Seed with two short filiform beaks. Panicle compound, loose, branches pendulous,
196. Poa. Glume 2-20-flowered. Valves shorter than the florets. Paleæ sometimes woolly at the base, the upper bifid-toothed. Scales smooth. Seed furrowed. Panicle more or less branching or scattered.
197. Eragrostis. Glume 4-10-flowered. Valves shorter than the paleæ, which are imbricated in two ranks. Upper palea reflexed, its edges folded back, shell-shaped, entire, fringed, persistent. Seed loose, 2-horned, not furrowed. Panicle compound, more or less scattered.
198. Megastachya. Spikelets elongated: the florets imbricated in two rows. Glume 5-20-flowered. Valves shorter than the florets. Lower palea emarginate, with a point between the divisions, upper bifid-toothed. Seed loose, not furrowed. Panicle compound.
5. Inflorescence spiked. Spikelets solitary, seldom many-flowered, with the upper flower abortive and differently formed. Glumes with a keel, not opposite. Lower palea generally bearded, seldom beardless, the upper with two keels. (Chloridea.)
199. Sclerochloa. Glume 3-5-flowered. Valves obtuse, shorter than the florets. Lower palea cordate, emarginate, obtuse, upper entire. Scales emarginate. Seed with a bifid beak. Spike simple. Spikelets 1-sided or dichotomous.
200. Eleusine. Glume 5-7-flowered. Valves obtuse. Paleæ obtuse, upper bifid-toothed. Scales truncate, fimbriate. Seed inclosed in a separate membrane, broadly and deeply furrowed. Inflorescence digitate. Spikelets 4-5, erect, 1 -sided.
201. Dactyloctcnium. Spikelets 1 -sided. Glume 5 -7-flowered. Lower valve with a falcate spine-shaped mucro. Iower palea navicular, ventricose, subulate, upper bifid-toothed. Scales truncate, fringed. Seed square, warted, obtuse, loose. Spikelets digitate, 4-5, erect or horizontal.
202. Leptochloa. Glume 3-5-flowered. Valves lanceolate, acute, nearly as long as the florets. Lower palea navicular, acute, upper bifid-toothed. Seed loose, furrowed. Panicle simple. Branches alternate, simple, with nearly 1 -sided spikelets.
203. Cynodon. Spikelets 1 -sided in a simple row. Glumes membranous, persistent, shorter than the florets, and only embracing them at the base. Fertile floret with the upper palea bifid-toothed. A rudiment of an abortive floret, stalked, smooth, ciavate. Scales truncate. Seed loose, not furrowed. Spike digitate. Spikelets 4-5-filiform, simple, slender.
204. Dinebra. Glume 2-5-flowered. Valves subulate. Paleæ bifid, emarginate, the lower setigerous under the end. Scales truncate, or somewhat lanceolate. Inflorescence spiked, acuminate, the point of the rachis protruding beyond. Spike simple or compound. Spikelets 1-sided, alternate, remote, pendulous.

205 Echinaria. Spikelets close together. Glume 2-4-flowered. Valves mucronate, shorter than the florets. Lower palea truncate, fringed, terminated by 5 lanceolate unequal bristles, upper cordate, emarginate, with two similar bristles. Scales truncate. Seed loose, gibbous, not furrowed, with two diverging beaks. Spike simple, capitate
6. Inflorescence spiked. Spikelets solitary, in pairs, or several together, 1-flowered, or many-flowered. Glumes opposite, equal. Lower palea bearded or beardless, upper with two keels. (Cerealia.)
206. Triticum. Glume 2-valved, many-flowered, shorter than the spikelet : the valves nearly equal, beardless, or with one beard enclosing the florets. Paleæ 2, one of them being bearded from the end. Seed inclosed in the paleæ, rarely otherwise.
207. Lolium. Spikelets sessile, to the lowest a glume of one valve, to the uppermost of two opposite valves. Lower palea with a mucro or bristle at the end, upper membranous, bifid-toothed. Scales with two unequal teeth. Seed furrowed.
208. Elymuts. Spikelets in each tooth of the rachis two or more, 3-9-flowered. Glume 2-valved, nearly equal, rarely (as in E. Hystrix) absent or nearly so. Lower palea entire with a bristle which is sometimes very short, upper somewhat bifid-toothed. Scales ovate, hairy. Seed furrowed. Spike simple.
209. Secale. Spikelets in each tooth of the rachis solitary, 2-3-fowered, the two lower florets fertile, sessile, opposite, the upper abortive. Glumes subulate, opposite, entire, shorter than the florets. Lower palea entire, with a very long bristle, upper bifid-toothed. Scales obovate, hairy. Seed coated, furrowed.
210. Hordeum. Spikelets 1-flowered, three together, the two lateral often barren. Glumes 2, subulate. Paleæ 2, the lower bearded. Scales 2. Stigmas feattery. Seed coated with the paleæ.
211. Microchloa. Spikelets l-flowered. Glumes 2, membranous, beardless. Paleæ 2, much shorter than the glumes, villous. Stigmas very finely divided.
212. Ophiurus. Glumes cartilaginous, half immersed in hollows of the rachis, longer than the floret. Palea membranous, transparent. Ovarium cordate. Spike simple,
213. Monerma. Spikelets half immersed in hollows of the rachis. Glume 1-valved, cartilaginous, furrowed. Paleæ membranous, transparent. Scales lanceolate, entire, smooth. Spike simple. Rachis jointed, toothed.
7. Inflorescence spiked, or panicled, jointcd. Spinelets generally in pairs, 1 or 2-flowered, the one sessile, the other stclhed, and usually of one sex only. Ghames of a stouter texture than the palese, neither keeled nor opposite. Palece very delicate and membranous, not with a keel, the lower commonly bearded. (Saccharina.)
214. Perotis. Glume 2-valved: valves with a long bristle at the end. Palea 1, nearly as long as the calyx. Spike nearly simple, involucrated at the base, with woolly hairs
215. Saccharum, Glume 2-valved, 2-flowered, enveloped in long wool. Lower floret neuter with one palea, upper hermaphrodite with two palea, the upper of which is very small or obsolete.
216. Imperata. Glume 2valved: valves herbaceous, at the lower part of the back clothed with very long hairs the length of the paleæ, which are two, and beardless, the lowest only half the size of the other. Scales none. Stamens 23.

8. Inflorescence panicled. Spikelets solitary, 1-flowered. Lower palece cartilaginous, compressed, keeled. Stamens frequently more than 3. (ORyza.)
217. Leersia. Spikelets 1-flowered. Glumes O. Palese 2, beardless, keeled, compressed. Scales 2. Stamens 3-6. Stigmas very finely cut. Seed loose, inclosed in the paleæ.
9. Shrubby. Inflorescence panicled. Spikelets many-flowered. Upper palea with two keels. (Bambusacea.)
218. Diarrhena. Glume 2valved: valves navicular, rigid, the lower smaller, shorter than the florets. lower palea navicular, rigid, upper membranous, the edges broad, folded back. Scales 2, ovate, entire. Ovarium with a hood. Seed furrowed, hardened, shining, loose.
219. Arundinaria. Glume 5-7-flowered. Valves unequal, with stalked florets. Lower palea very acute, upper bifid-toothed. Scales 3, smooth. Stigmas 3, feathery. Styles 3.

## Order 3. TRIGYNIA.

8) 8 Stamens. 3 Styles.

Cal. 5-leaved. Petals 5. Caps, sub-cylindrical, 1-celled, opening at the end, 6-vaved, 220. Holosteum. many-seeded
221. Polycarpon. Cal, 5-leaved, 5-cornered. Petals 5, very small, ovate. Caps. 1-celled, 3-4-valved: valves lanceolate, twisted inwards. Seeds many.
222. Lechea. Cal. 3-leaved. Petals 3, linear. Caps. 3-celled, 3-valved, and as many inner valves. Seed 1.
223. Eriocaulon. Common calyx an imbricated head. Petals 3, equal. Stamens above the ovarium.
224. Montia. Cal. 2-3-leaved. Cor. monopetalous, irregular, 5-parted. Caps. 1-celled, 3-valved, 3-seeded.
225. Mollugo. Cal. 5-leaved. Cor. O. Caps. 3-celled, 3-valved,
226. Minuartia, Cal. 5-leaved. Cor, O. Caps, 3-celled, 3-valved. Seeds a few.
227. Queria. Cal. 5-leaved or 5-parted. Cor. O. Caps, 1-celled. Seed 1.
228. Königía. Cal. 3-leaved. Cor, O. Sced 1, ovate, naked.

## MONOGYNTA

544 Radical leaves spatulate ovate undivided; cauline pinnatifid, Stem crect, Flowers panicled diœcious 545 Leaves all pinnate : pinnæ lanceolate-toothed, Stem hollow furrowed, Flowers corymbose
546 Cauline leaves pinnate, radical undivided, Stem smooth slender, Flowers corymbose
547 Leaves toothed radical cordate simple, cauline ternate ovate oblong, Leaflets lateral lanceol. Stem erect 548 Leaves oblong rather toothed; lower obtuse, upper acute, Stem erect, Flowers panicled
549 Leaves undivided entire obt. radical cuneate obl. cauline linear, Stem smooth ascending, Flowers racemose 550 Radical leaves lanceolate oblong entire, cauline pinnatifid, Stem smooth, Flowers pink corymbose
551 Leaves undivided, radical clliptical 3-nerv, entire and toothed, caul, linear, Stem erect, Corymbs racemose 552 Radical leaves ovate, cauline cordate sessile cut halbert shaped, Flowers racemose
553 Leaves cord, uneq. toothed : lower simple, upper ternate and pinnate, Stem striated, Flowers corymbose 554 Radical lvs. pinnated, Leaflets ovate coarsely toothed, caul, pinnated downwards, Segm. lanceol, toothed 555 Leaves simple ciliated, radical obovate, cauline lanceolate, Flowers panicled

556 Leaves membranous pinnatifid, Segm. lanceol, : the terminal very large, Stem snooth, Flowers corymbose 557 Leaves rather fleshy pinnatifid, Segm. entire obt, of nearly one shape, Stem hairy in 2 rows, Flowers corymb.

558 Caps, linear 3-tonthed: the outer larger recurved, Stem smooth, Flowers in dichotomous spikes 559 Caps, naked globose compressed, Stem weak, Flowers in heads
560 Caps, polished ovate, Limb of the calyx short 3-5-toothed crowned, Stem smooth, Flowers corymbose 561 Caps, ovate villous, Limb of the calyx bladdered crowned, Stem a little villous, Flowers nearly in heads 562 Caps. villous, Limb of cal. 6-10-tooth. crowned, Crown camp. Teeth long straight, Stem puhesc. Fls. in heads 563 Caps, vill. Limb of cal. 10 -12-rayed crowned, Crown rotate, Teeth long acute, Stem smooth, Flow. in heads 564 Caps. naked smooth cleft-keeled elongated, Stem weak, Flowers nearly in heads
565 Caps. ovate angular hairy irregularly toothed, Stem angular, Flowers corymbose
566 Caps. pubescent naked at the end, Leaves spatulate oblong nearly entire
567 Stem scabrous, Fruit ovate acute 1-toothed at the end pubescent
668 Caps. linear 6-toothed, Teeth hooked loose, Stem and radical leaves spatulate, cauline pinnatifid pubescent

and Miscellaneous Particulars.
Phu is the Arabic name of the species so called.
79. Patrinia. Named by M. Jussieu in honor of M. Patrin, an assiduous French botanist, who travelled in Siberia, where all the species of the genus are found, and whence he sent home collections.
80. Valericnella. A diminutive of Valeriana, from which the genus has been divided. V. olitoria (Valeriana locusta, L.) Mache salade de prêtre, Fr., corn salad or lamb's-lettuce, from its appearing in corn fields about the time when lambs are dropped; furnishes an agreeable salad, the leaves tasting little inferior to young lettuce. To have it early, it should be sown in autumn on a warm border. All the species are of as easy culture as those of Valeriana.

History，Use，Propagation，Culture，
81．Calymenia．So named from $\tau \alpha \lambda \varepsilon \xi$ ，a calyx，and i $\mu n v$ ，a membrane，on account of the membranous calyx by which the genus is distinguished．
82．Laffingia．In honor of P．Lœefling，a Swedish botanist，who published a volume of travels in Spain，\＆c． These are plants of no beauty，and are only cultivated in botanic gardens．
83．Hippocratea．In honor of the celebrated Hippocrates，the father of physicians，born in the island of Cos，who flourished 450 years before the vulgar æra．Plumier，who first fixed the genus，called it Coa，which Linnæus changed to its present name．
84，Cneorum．Kveweov is a plant described by Theophrastus，as resembling the olive．This is a low yellowish evergreen shrub，which like Veronica decussata，will endure our winters in the open air，with protection during frost．It grows naturally in hot dry barren and rocky soils；thrives well in an artificial state in any light earth；ripened cuttings will root in sand under a hand－glass，or it may be raised from seeds，which it produces in abundance．
－85．Comocladia．Koun，hair，and x $\lambda \alpha \delta 05$ ，a branch．The branches are tufted at the top of the tree．C．in－ tegrifolia is a handsome tree with an erect trunk，dividing into few branches，adorned with pinnated smooth leaves，like a frond；flowers numerous，fruit a deep red，shining，eatable，but not inviting．The wood is hard， of a fine grain，and reddish color．If C．dentata be ever so slightly wounded，it emits a strong smell of dung： it grows in Cuba，where the natives have a notion that it is dangerous to sleep under its shade．This genus is not frequent in British collections：it thrives in loam and peat，and may be propagated by ripened cuttings placed under a hand－glass in moist heat．

569 Villous viscid, Leaves cordate, Flowers racemose, Stamens longer than the corolla
570 Leaves lanceolate, Peduncles aggregate axillary solitary, Calyxes 3-flowered, Stem ascending 571 Leaves cordate ovate smooth, Peduncles terminal heaped, Stamens shorter than the corolla

572 Flowers triandrous monogynous, Leaves very small: lower linear, upper subulate
573 Leaves oblong-ovate lanceolate or elliptical serrated, Capsules oval

## 574 Smooth, Flowers axillary

575 Hoary, Leaves flower-bearing powdery, Petals and stamens 4
576 Leaflets stalked ovate-lanceolate entire
577 Leaflets stalked ovate-lanceolate prickly-toothed
578 Leaflets sessile angular-spiny

## 579 Leaves linear-subulate, Head globose many-flowered, Petals alternate pencil-shaped

580 Scape slender, Head globose
581 Culm 2-edged and leaves smooth very narrow, Head subovate, Scales imbricate on each side, Keel of the glumes ciliate
582 Leaves ovate-lanceolate sessile, Stem procumbent, Flowers axillary sessile
583 Leaves ovate-lanc. nearly sessile acute with the creeping stem smooth, Involucr. cordate doubled together 584 Flowers uneq. Involucres cord. folded together at base with sheaths ciliated, Leaves lanc. sess. Stem decumb. 585 Leaves lanceolate sessile with the decumbent stem smooth, Involucr, cordate doubled together
586 Leaves ovate stalked obtuse, Involucres cordate hooded turbinate
587 Leaves ovate-lanceolate rough, Involucres hooded turbinate, Stem erect
588 Leaves lanceolate stalked rough above, Sheaths rusty, Stem erect simple
589 Leaves linear-lanceolate sessile rather hairy, Involucres ovate doubled together, Stem creeping
590 Villous, Leaves ovate stalked, Involucres half round folded in at the edge, Stem creeping
591 Leaves ovate-lanceolate sessile ciliated, Involucres cordate folded together, Stem erect
592 Involucres cord, acumin, folded together, Pedunc. pubesc. Pedicels smooth, Lvs. obl, lanc. Sheaths ciliated
593 Smooth, Stem creeping, Leaves lanceolate, Flower-stalks 2-flowered
594 Stem solid woody with distant leafy knots, Leaves long ovate acuminate fascicled villous
595 Stem branched diffuse, Leaves ligulate acuminate, Racemes alternate about 7 placed in a panicle form, 3 Stamens bearded 3-naked

596 Leaves lanceolate, Flowers panicled
597 Stem branching, Branches and branchlets opposite, Flower-stalks many-flowered 598 Flower-bearing branches dichotomous, Flowers solitary
599 Leaves subulate prismatic, Spiny at the end
600 Leaves subulate scattered spreading distinct somewhat recurved, Cal. nearly as long as capsules

## 1. Vernal.

601 Mouth of flower closed by hairs, Segments obtuse, Stigmas dilated, Flowers large early 602 Segments of flower quite entire obt. Anthers twice as long as the stigmas, Mouth of flower closed by hairs

and Miscellaneous Particulars.
86. Xyris. Xugos, acute. Its leaf terminates in a sharp point. Under this name a plant is described by Pliny, which resembles an iris. Pretty little rush-like plants with yellow flowers; uncommon in collections, but easily cultivated, though rarely flowering.
87. Callisia. From zaios, pretty; a name aptly given to this plant, which is easily known by its shining leaves edged with purple.
88. Commelina. So named by Plumier, in honor of the brothers, John and Gaspar Commelin, botanists and Dutch merchants. Some of the species, such as C. coelestis and tuberosa, are very showy herbaceous plants; others are mere weeds. They are all easily cultivated in wet places in the stove or greenhouse, and propagated by the rooting joints of their stem or by division of the roots, or by cuttings.
89. Aneilema. From ayє $\lambda \in \omega$, to evolve, the flowers being evolved, as it were, from the spatha. A genus resembling Commelina, from which it is chiefly distinguished by not having its flowers enclosed in a spatha.
90. Cartonema. From zogтos, shorn, and v⿲uผ, a filament, in reference to the stamens. A plant resembling Commelina.
91. Ortegia, In honor of Casimir Gomez de Ortega, a Spanish botanist, and professor of botany at Madrid. An insignificant herbaceous plant.
92. Polycnemum. IIoдes, many, zעnun, knee, on account of the number of joints of the stem. A decumbent annual plant of no beauty.
93. Crocus. A name given by Theophrastus. The story of the youth Crocus being turned into this flower, may be read in Ovid's Metamorphoses. This is an ornamental genus of great value in the flower-garden, on

History, Use, Propagation, Cuiture,
account of the early season of flowering, and the brilliancy of the flowers. Haworth, who has for thirty years paid particular attention to the Crocus, (Hort. Trans. i. 122.) and raised many varieties from seed, found that the blue, purple, and white flowered kinds, ripened their seeds much more readily than the yellow, and that the leaves of the latter were narrower through all the species and varieties. When this genus is in flower, the germen is situated underground almost close to the bulb, but some weeks after the decay of the flower, it emerges on a white peduncle, and ripens its seeds above ground. This extraordinary mode of semination is peculiarly conspicuous in C. nudiflorus, which flowers without leaves in autumn, and throws up its germen the following spring like the Colchicum. Though some species of Crocus are, or appear to be, naturalized in a few places, yet they cannot be considered as aboriginal natives. Allioni affirms the C. sativus (the saffron) is indigenous in Savoy; but Ray says nothing is certain as to its native country. Professor Martyn considers Asia as its native country, saffron having there first acquired that high reputation in medicine, which it has now almost lost in Europe. The Arabic name Z'afarân, and the Moorish and Spanish terms Azafran and Safra, seem to confirm this opinion. C. vernus, the saffran printanier, Fr., is a native of Switzerland and Italy, and is commonly found with white flowers and a purple base. Some botanists consider it and C. sativus as the only distinct species of the genus. Miller describes four, Willdenow four, Sir J. E. Smith three, as natives of Britain, and Haworth (Hort. Trans. 1. 132.) no fewer than thirteen species. Parkinson certainly cultivated many varieties which are not now known in collections. Crocus vernus and versicolor, produce by cultivation varieties of singular beauty, both as to size, color, and marking. C. sativus, the saffron. Saffiran, Fr. and Ger, and Zafrano, Ital., is said to have been first brought into England in the time of Edward III,, and introduced to Walden in Essex, to which town it afterwards gave the prænomen. It was abundantly cultivated there, and in Cambridge, Suffolk, and Herefordshire, in the beginning of the 17th century; but the article is now so little in repute, or so much cheaper in foreign markets, that at present the culture of saffron is confined to a few parishes round Saffron Walden. The bulbs are planted in July in a well pulverized soil, not poor nor a very stiff clay; they are placed in rows six inches apart across the ridges, and three inches bulb from bulb in the row. The purple flowers are gathered in September and carried home, where their yellow stigmas and part of the style are picked out and dried on a kiln between layers of paper, and under the pressure of a thick

603 Segments of flower acute, Stigmas small, Flowers small late, Mouth of throat closed by hairs
604 Stigmas convolute hooded lobed as long as the anthers
605 Leaves longer than flowers, Stigmas but little longer than the anthers
[membranous
606 Stigma inclosed trifid longer than stamens, Lobes filiform cucullate crisp, Lvs. setaceous, Tunic of the bulbs 607 The three outer segments of flower revolute
608 Stam. as long as the truncate torn stigmas, Leaves supporting the flowers, Bulbs coated with net-work 609 Leaves longer than the flowers, Spathes 2 inner narrowest, Limb of cor. funnel-shaped, Stigma length of 610 Stigmas unequal much longer than the anthers
[anthers flattish jagged

## 611 Filaments hairy, Anthers longer than the stigma

612 Stigma enclosed trifid, Lobes somewhat linear toothed, Coat of the roots membranous
$\beta$ Pale cream-coloured flowers
$\gamma$ Pale cream-coloured flowers, with 3 sky-blue lines on the tube
613 Leaves upright-spreading: their keel blunt: sides nerveless, Flower in the sun campanulate stellate 2. Autumnal.

614 Stigmas very long reflexed crenate at the end
615 Stigmas erect much divided, Leaves coming out with the flowers
616 Stigmas erect much divided, Leaves later than the flowers
617 Bulbs with a thready skin, Leaves later than the f . Stam. as long as the truncate stigmas, Flower large

## 618 Flowers spiked, Outer segments of flower downy without 619 Flowers corymbose smooth

627 Leaves slender, Raceme flexuose many-flowered
628 Limb spreading spotted at base, Stigmas not divided lower than the base of the anthers
629 Filaments united in a tube
630 Filaments united at base
631 Leaves lanceolate, Spathe toothed much shorter than the filiform tube, Segments lanceolate
634 Limb campanulate spreading spotted at base, Stigmas divided as low as the tube
633 Smooth with stalked bulbs, Leaves linear ensiform, Flowers in spiked heads, Tube shorter than segments 634 Leaves linear ensiform edged, Scape many-spiked many-flowered, Flowers spotted at base
635 Limb spreading not spotted, Stigmas divided as low as the tule
636 Limb hemispherical campanulate, Stigmas longer than anthers

board to form the mass into cakes. Two pounds of dried cake is the average crop of an acre after the first planting, and twenty-four pounds for the two next years. After the third crop the roots are taken up, divided, and transplanted.
The uses of saffron in medicine, domestic economy, and the arts, were formerly very various. It is now employed by painters and dyers, and enters into sauces, creams, biscuits, conserves, liqueurs, \&c.

As a garden-flower, the $C$. vernus is the parent of many varieties, and these may be increased at pleasure by propagating from seeds. Haworth directs to sow these immediately after being gathered in light earth, in a shady, but open situation. Sift over them half an inch of earth the first autumn, and the second take them up and immediately replant them. Add another half inch of earth the third autumn, and the following spring most of the plants will show flowers in the midst of their fourth crop of leaves. Afterwards they may be treated like old bulbs, and planted in the open borders or shrubbery, in patches, rows, or as fancy may direct. The bulbs of crocus being renewed every year, and the new bulb formed on the top of the old one, it follows, that at whatever depth they may have been planted, they will in a short time rise to the surface, unlike the tulip and the bulbous iris, whose new bulbs being formed under the old ones, soon sink the plants, unless growing on a hard subsoil. Crocus bulbs should be taken up every third year, after the leaves decay, dried in the shade, parted, and replanted three inches deep, and not later than michaelmas. The longer they are kept out of the ground after this period they become the weaker and fower the later. In this way, and by preserving them in an icehouse, they may be retarded so as to flower at midsummer or later; and they may be accelerated by heat or blown in water-glasses, or on fancy pots called cats, hedgehogs, \&c. common in the seed-shops. The yellow-flowered species force better than the blue ones.
94. Witsenia. In honor of Mr. Witsen, a Dutch consul in India, a patron of botanical science, and of Thunberg. This genus and all the succeeding, as far as Pardanthus, consist of handsome herbaceous and bulbous plants, flowering for the most part in the spring, and not distinguished from each other by very distinct characters. The bulbous sorts are easily cultivated in pots, are nearly all natives of the sandy wastes of the Cape of Good Hope, and are capable of succeeding well in a warm open border. To make them flower well in pots, they should have no water while they are dormant,

## History, Use, Propagation, Culture,

95. Iria. Derived from 'x $\mathbf{c c}$, to fix, in allusion to the viscid nature of the roots of some species.
96. Trichonema. From $\theta_{\ell \in} \iota$, hair, and vnux, a filament; the filaments being hairy.
97. Geissorhixa. From resनoow, to shape like the tiles or eaves of a house, and jis $\alpha$, a root
98. Hesperantha. From érregn, evening, and $\alpha v \vartheta 05$, a flower, in reference to the time the flowers expand.

637 Tube twice as long as spathe, Segments oblong, Stigmas split gaping
638 Tube the length of the spathe, Segments spatulate concave, Stigmas funnel-shaped
639 Leaves curled
640 Leaves linear channelled
641 Leaves linear nerved thickened at the edge
642 Radical leaves with 4 furrows, Outer valve of spathe convolute rigid, Flower turbinate, Segments lanc. 643 Leaves twisted, inflated at base, Flower very large spreading, Segm. with a black mark at the base, Stamens bearded at base, Anthers connate
644 Leaves linear, very long, Flowers veiny, spreading on long stalks, Edge of spathe membranous
645 Leaves filiform, Scapes 1-flowered, shorter than the campanulate flower
646 Leaves radical linear acute, Stem smooth, a little honey-pore at the base of the divisions of the flower 647 Leaves filiform, Stem few-flow. smooth, spathes scarious much longer than tube, Segments of flower obl. 648 Stem simple few-flowered, Radical leaves bristly
649 Radical leaves ensiform-linear obtuse
650 Radical leaves linear-acute, Stem villous
651 Radical leaves ovate oblong
652 A doubtful species, known only by name

653 Leaves fistulous
654 Leaves linear hairy, Stem smooth
655 Leaves linear with stem smooth
656 Radical leaves falcate smooth
657 Radical leaves falcate curled

658 Spathes spotted, Limb of flower regular

659 Spathes spotted, Limb of flower bilabiate
660 Spathes lined, Limb of flower regular: segments ovate-oblong

661 Spathes lined, Limb of flower regular: segments elliptical
662 Leaves waved curled, Segments of flower flat
663 Scape 3-cornered : angles membranous
664 Outer valve of the spathe cuspidate, Tube of the flower very long, Upper segment largest
665 Spathe lanceolate pointed, Flower striped: Upper segment erect largest, the rest linear oblong
666 Outer valve of the spathe obtuse 3-toothed, Tube very long, Segments of the limb equal
667 Leaves ensiform, Flowers in two rows, Spathes membranous shorter than tube, Segm. of the limb linear

668 Upper segment of flower largest, outer retuse
669 Outer valve of spathe obtuse 3-toothed at end, Three lower segments of the limb with a stalked perpendicular callus at base
670 Outer valve of spathe cuspidate, Three lower segments of limb with a stalked perpendicular callus at base 671 Limb campanulate: segments approximated, transparent at the edge towards the base
672 Limb infundibuliform; segments distant, transparent at the edge towards the base
673 Limb campanulate transparent at the base
674 Three outer segments gibbous within, at the base spotted and carinate
675 Leaves ensiform, Scape many spiked, Base of the flower lined not transparent
676 Spikes reflexed one-sided, Flowers infundibuliform, Spathes very short, Leaves linear ensiform
677 Leaves fistular slender
678 Upper leaves linear ensiform ; lower fistular compressed
679 Leaves linear very narrow
680 Leaves linear ensiform, Anthers as long as throat, Corolla funnel-shaped with elliptical pointed segments
681 Leaves ensiform thickened at the edge, Spikelets several appressed, Flower funnel-shaped

and Miscellaneous Particulars.
99. Sparaxis. From $\sigma \pi \propto \propto \sigma \sigma \omega$, to tear. The generic distinction consists in the lacerated spathas.
100. Tritonia. Named by Mr. Bellenden Ker, from Triton, understood, as he informs us, in the sense of a vane or weathercock, in allusion to the variable direction of the stamens in different species.
101. Watscnia. Named by Miller in honor of Dr. Wm. Watson, his friend. W. brevifolia has its blossoms

History, Use, Propagution, Cuiture,
of a micacious hue, glittering in the sun, and not to be represented by art. W. iridifolia is a shewy border flower of a month's duration. W. mexicana is also very shewy, and has kidney-shaped bulbs.
162. Babiana. A name barbarously derived by Mr.J.B.Ker from the name babiuner, which the Dutch colonists at the Cape have given to the plant, because its roots are the favourite food of baboons. B, ringer s has dark-red bulbs.

10:3. Lapeyrousia. So named by Mr.J.B. Ker, in honour of Lapeyrouse the celebrated and unfortunate French navigator.

682 Stem upright many spiked, Leaves linear-lanceolate smooth edged with red
683 Leaves ensiform thickened at the edge, Spikelets several close together, Limb campanulate, Throat naked 684 Leaves ensiform very short, Limb spreading; inner segments widest
685 Flowers recurved, Tube the length of the spathe, Segments of limb acute
686 Flowers recurved, Tube longer than the spathe, Limb with obtuse segments 687 Flowers recurved, Tube the length of the spathe, Linab with acute segments 688 Flowers recurved, Throat nearly 4 tlmes as long as the segments of the limb

689 Leaves villous, Flowers ringent
690 Leaves smooth, Flowers ringent
691 Tube filiform clavate three times as long as the irregular limb: Upper segment divaricating
692 Tube filiform twice as long as the regular limb; Segments obtuse alternate with a point
693 Segments longer than the throat marked with a darker linear longitudinal spot
694 Leaves stiffish subvillous plaited, Flowers distichous, Segments alternately curled
695 Segments length of the tube nearly equal, the alternate ones wavy : the upper convolute at the end 696 Flowers funnel-shaped, regular ; Segments scarcely longer than the tube, flat
697 Segments of flower thrice as long as the tube
698 Tube filiform the length of the regular campanulate limb: alternate segments oltuse with a point
(i9) Limb much spreading, Segments rhomboidal spotted at the base
700 Flowers corymbose, Stamens much spreading
701 Flowers solitary
702 Tube very short, Segm. nearly equal aristate, Scape panicled, Ieaves linear rather shorter than the scape 703 Many spiked, Scape weak, Spikes capil. flexuose, Leaves sword-shaped smooth dist. shorter than scape

704 Leaves linear ensiform, Upper segment of flower very long, lower very small
705 Leaves linear ensiform with 3 ribs on each side, Throat of the flower cylindrical, longer than segm. of limb 706 Leaves 4 -cornered 4 -furrowed, Upper segment of flower very long, lower very small subulate
707 Upper segm. of flower spat, divar. incurv, lat. rhomb-shaped ovate spread. lower spat. acute hanging down
708 Upper segm. of fl. obov. recurved, lateral rhomb-shaped ovate spread. lower spat. acumin. hanging dowr
709 Upper segm. of fl, vaulted, lat. rhomb-shaped ovate spread. lower hanging down spat. obtuse with a point
710 Sterile bulb with a single linear pubescent leaf, Flowering bulb leafless, Flowers subringent
711 Leaves linear-ensiform pubescent, Flowers nearly regular
712 Leaves linear-ensiform 3-ribbed on each side, Segments of flower longer than the throat
713 Ieaves very long linear glaucous: nerves prominent on both sides, Segments of flower cordate
714 Tube of the campan. fl. shorter than the spatha, Segments ovate obtuse: the 3 lower with a hastate shot 715 Leaves t-cornered 4-furrowed, Segments of flower nearly equal

716 Leaves 3 slender upright 4-cornered, Spike 23 fld. 1-sided, Fl. funnel-shaped nearly equal somewhat nodd. 717 Leaves linear the edge on each side ribhed, middle nerve nearly obsolete
718 Leaves linear with a rib on each side in the middle, Sheaths radical spotted
719 Tube Ingr. than spathe, Up. seg. wider than rest, convol. and recurv, at end; lowest very narrow hang. down
720 Tube twice as long as the segments of the limb which are acuminate wavy and reflexed
721 Tube shorter than the spatha, Limb campan. subringent : upper segm. concave; the lower narr. spotted 722 Leaves lanceolate smooth, Scape about 3 -flowered longer than the leaves, Flower nearly campanulate
723 Leaves linear with a rib on each side in the middle, Tube longer than the spatha, the lower segments with a stalked 3 -angular spot
724 Flowers ringent remote in two rows, Tube shorter than spatha, Segm. lanc. the lat. rolled inwards at edge
725 Flowers erect funnel-shaped, Segments wavy, three lower nearly half as short as the others
726 Flowers erect turbinate campanulate, Segments equal in length, upper widest
727 Flowers erect campanulate, Segments equal in length: upper narrower than the lateral ones
728 Spikes several one-sided, three lower segments marked with a white lanceolate spot
729 Spike 2 -rowed, Upper seg. covered by lateral ones; the 3 lower marked by a white edged linear lane. spot 730 Spike 1 -sided, Upper seg. covered by lat. ones; 3 lower marked by a white lin.-lanc. spot, lowest very large 731 Spike 1-sided, Uper segm. divaricating, 3 lower nearly equal, marked with a white edged lin. lanc. spot
732 Leaves broad lanceolate rather wavy

and Miscellaneous Particulars
104. Melaspharula. From $\mu s \lambda a c s$, black, and $\sigma \phi \alpha, \rho \alpha$, a globule. In allusien to the colour and figure of the bulblets figured by Jacquin in his representation of the plant.
105. Gladiolus. From the Latin gladius, a sword, in allusion to the shape of the leaves. G. communis is a shewy border flower, of which there are several varieties in general cultivation. G. cardinalis is a splendid plant, with scarlet flowers spotted with white.
106. Anomatheca. From two Greek words (ceomos and inze) signifying a singular capsule. The capsule of the genus is remarkable for being, as it were, frosted.

IIistory, Use, Propagation, Culture,
107. Antholyza. From ay, 15 , a flower, and $\lambda$ vaб๙, rage. A metaphorical name. The flower has some resemblance to the mouth of an animal, which by the aid of a little imagination, may be supposed ready to bite.
108. Xiphidium. A name of a similar import with Gladiolus, being derived from $\xi \uparrow \frac{1}{}$, a sword, in allusion to its stiff and sword-shaped leaves,
109. Leptanthus. $\Lambda_{\varepsilon \tau \tau 0}$, slender, and $\alpha y, 705$, a flower. The tube of the flower is long and slender. These are aquatic floating plants of little beauty.
110. Wachendorfia. In memory of E. J. Wachendorf, a Dutchman, and professor of botany at Utrecht.
111. Hamodorum. "Atux, blood, and $\delta \omega$ gov, a gift; that is to say, a plant which produces a red flower.

733 Leaves ensiform nerved, Upper segment longest stretched forward, the others recurved.

734 Leaves smooth, Petals linear-lanceolate
735 Leaves hairy, Petals ovate
736 Leaves roundish reniform, Spathes oblong acuminate many-flowered
737 Leaves all linear
738 Scape nearly simple, Panicle contracted, Leaves ensiform 5-nerved perennial plaited smooth 739 Scape many spiked, Panicle spreading, Leaves sword-shaped 3-nerved annual plaited smooth 740 Scape many-spiked, Panicle spreading, Leaves sword-shaped channelled smooth
741 Scape many spiked, Panicle spreading, Leaves linear sword-shaped 3-nerved plaited villous 742 Leaves elliptic sword-shaped hairy

743 Corymbs compound, Branches spreading, Leaves flat
744 Flowers headed, Spathes many-parted torn
745 Heads of flowers alternate, Spathes entire
746 Flowers alternate, Segments of flower equal
747 Flowers alternate, three of the segments less than the rest
748 Scape about 1-flowered, Leaves linear-lanceolate a little falcate
749 Petals ovate oblong, Corymb level-topped hairy
750 Petals linear, Corymb level-topped villous viscid
751 Leaves ensiform, Scape rillous above, Flowers spiked one-sided
752 Leaflets of the crown subulate

1. Flowers bearded.

753 Stem 1-flowered longer than the leaves, Smaller petals deflexed
754 Stem 2flowered longer than the leaves, Flowers sessile
755 Stem many-flowered longer than the leaves, lower flowers stalked, Spathes colored
756 Stem many-flowered longer than the leaves, Flowers sessile, Spathes white
757 Leaves lanc. rather plaited, half as short again as the branching stem, Spathes leafy, Tube length of germen
758 Stem about 2 flowered the length of the leaves, Germens 3-cornered
759. Stem many-flowered longer than the leaves, Petals emarginate: the outer flat

760 'Stem many-flow. longer than the leaves, Outer petals revolute, inner nearly upright, wavy and inflexed
761 Stem many-flowered longer than the leaves, Deflexed petals folded back upright emarginate
762 Stem many-flowered as long as the leaves, Deflexed petals emarginate, erect oblong
763 Stem many-flowered longer than the leaves, Erect petals entire, deflexed rather emarginate
764 Leaves shorter than the 3-flowered stem, Larger petals undulate reflexed, smaller emarginate
765 Scape round about 3-flowered longer than the leaves, Deflexed petals narrower than the erect ones
766 Scape about 1-fl. scarcely shorter than ensiform leaves, Tube of corolla about equal to the 6 -streaked germen
767 Stem compressed about 1-fl, the length of leaves, Petals about equal, Beard crested, Germens 3-cornered
768 Scape compressed many-flowered, Stigmas jagged
769 Scape 2-flowered shorter than the ensiform leaves, Upper flower abortive
770 Scape very short about 1 -flowered, Spathe erect the length of the tube
771 Scape 2-fiowered longer than the leaves, Spathes the length of the tube
772 Scape very short 1-flowered, Spathes shorter than the tube, Reflexed petals narrower than the erect ones
773 Nearly stemless, Scape panicled round, Branches 2-4-flowered
774 Leaves ensiform smooth somewhat falcate nearly equal to the many-flowered scape, Spathes inflated
775 Leaves ensiform falcate smooth, Scape 1-flowered, Petals obovate
2. Flowers beardless.

776 Leaves flat, Inner petals less than the stigma
777 Stem one-angled many-flowered longer than the leaves
778 Stem round flexuose equal to the leaves, Germens nearly 3-cornered

and Miscellaneous Particulars.

## 112. Aristea. From arista, a point or beard. The leaves are bearded.

113. Dilatris. A name not satisfactorily explained.
114. Brodica. Named in honor of Mr. Brodie, of Brodie House, a Scotch gentleman, who paid great attention to the botany, especially Cryptogamia, of his own country.
115. Iris. The name given by Theophrastus, Dioscorides, and Pliny, from the variety of its colors. According to Plutarch, the word iris signified, in the ancient Egyptian tongue, eye: the eye of heaven. This beautiful genus abounds in Europe, but is rare in America. Some are bulbous, but the greater part tuberous rooted, of easy culture, and propagation by seed or division of the root. The roots of I. florentina, ger-

History, Use, Propagation, Culture,
manica, and pseud-acorus are used in medicine; those of the first are remarkable for communicating an odor like that of violets, and are the orrice-root (iris root) of the shops. The root of I. pseud-acorus, in powder, used as snuff, produces a great heat in the mouth and nose, and occasions discharge from the nostrils: it is astringent, and used instead of galls in making ink or dying black. The fresh juice of the root is one of the and the root of either species suspended in wine or beer, keeps the latter from growing stale, and communicates and the root of either species suspended in wine or beer, keeps the latter from growing stale, and communicates a pleasant taste and smell to the former. The leaves and roots of I. foetidissima are steeped in beer by the country people in some places as a purge. I. susiana flowers well in a warm border and loamy soil. I. fimbriata is rather tender; it requires a rich light soil, and to make it flower freely, it must be planted in a large pot, and have the suckers removed from the roots as soon as they appear. I. orientalis requires a similar treatment, and with the two preceding species requires the protection of a green-house to make it flower in perfection. Of 1 . xiphioides there are numerous varieties procured from seeds, which are treated much in the same way as those of crocus. This species, and I. tuberosa are very ornamental; they thrive best in a light

779 Stem round flexuose as long as leaves, Petals all emarginate obovate, the inner shortest, Capsules very large 780 Stem 2-edged many-fiowered longer than the leaves
781 Leaves linear, Scape round, Germens 6 -cornered, Stigmas acute, Petals rounded
782 Leaves linear, Scape about 3-flowered round, Germens hexagonal, Petals ovate longer than their claw

## 783 Leaves ensiform, Scape nearly round, Germens hexagonal, Petals erect oblong

784 Radical leaves very long, Stem higher than the leaves, Germens hexagonal
785 Stemless, leaves channelled, Three erect petals very small, Tube very long
786 Leaves channelled subylate, Stem 2flowered, Petals nearly as narrow as stigmas, Germen round
787 Leaves channelled subulate, Stem 2 flowered, Petals much wider than stigmas, Germen acutely angular
788 Leaves channelled, Scape 2-flowered, Inner petals emarginate
789 Stemless, Leaves filiform very long, Scape very short 2 -flowered, Tube of the corolla filiform
790 Leaves linear subul. channelled longer than the very short 1 -flow. scape, Inner petals very short spreading 791 Leaves flat, Scape 1-flowered shorter than the leaves, Petals nearly equal
792 A little caulescent, Stem about 2-flowered shorter than the leaves, Spathes ventricose, Germens 3-angular
793 Stem about 3-flowered fistulous longer than the leaves, Germens 3-angular
794 Stem solid round as long as the leaves, Leaves very narrow long, Capsules long pointed at each end
795 Stem about 2-flowered 2edged shorter than the leaves, Germens hexangular
796 Leaves linear-ensiform very much longer than the 2 -flowered very short scape, Petals acuminate
797 Leaves linear longer than the 1-flowered scape, Alternate petals smaller
798 Leaves 4-cornered
799 Scape 1-flowered shorter than the 4-cornered leaves, Tube filiform, Root bulbous
800 Outer petals spatulate, Stem branched at the base shorter than the leaves
801 Leaves lanceolate falcate edged, Stem about 2 -flowered
802 Leaves ensiform shorter than the 3-fowered 2 forked scape, Germen 3-angular 3-cornered
803 Leaves linear acute length of the 3-f. scape, Spathes withered with a long point, Flowers close together 804 Leaves linear-lanceolate very long, Inner petals very short, Stigmas spirally revolute
805 Leaves ensiform doubled together striated incurved at end, Ovaries very long cylindrical, Stigmas keeled serrated at end
806 Segments of the flower nearly equal oblong spreading, Filaments united at base
807 Segments nearly equal obovate very spreading, Filaments united in a cylinder
808 Segments spotted and dotted at base, The three inner half as short as the others and much narrower erect 809 Inner segments linear, sometimes absent
810 Leaf filiform erect with 1-flowered scape smooth, Spathes obtuse
811 Outer segments very spreading bearded, Inner small 3-toothed at the end: the middle tooth the longest
812 Outer segm. deflexed bearded, Inner very small 3-toothed at end: the middle tooth longest and involute 813 Outer segments beardless; Inner very small 3-toothed at the end
814 Lower leaf longest of all, All the segments of the flower very spreading : the alternate ones small
815 Tube filiform very long: All the segments reflexed
816 Beardless, Flower uniform nearly equal, Stigmas petal shaped
817 Leaves very smooth, Stem branches and peduncles villous
818 Leaves about the length of the scape, All the segments of the flower spreading; the alternate ones smaller 819 Lower leaf spirally twisted, Stem smooth, Branches viscid
820 Leaves straightish, Stem and branches viscid
821 Stem panicled much branching, Segments nearly equal deflexed
822 Bearded, Leaves on the inside villous in lines, Stem pubescent, Invol, very smooth, Alternate segments of flower very small 3-toothed
823 Leaves ciliated, Inner segments erect
824 Tube filiform very long, Segments alternate erect
825 Leaves pubescent, all the segments spreading
826 Leaves slender dependent, Flowers terminal in close heads
827 Leaves perennial equitant, Segments of Hower spreading : alternate ones much the largest
828 One-flowered a little bearded, Leaves about 3 linear, Stem simple, Outer segments of flowers rounded: inner very narrow entire
829 Scape winged sword-shaped, Common spathe 2-leaved, partial 2flowered, Flower stalks simple

and Miscellaneous Partzculars.
sandy soil and eastern exposure; the bulbs are taken up every other year, but must not be kept longer out of ground than a month. I. persica is highly odoriferous; it is propagated by separating the bulbs, or from seeds; but by the latter mode no new varieties have hitherto been obtained. I. susiana and persica bear forcing well : supplies of them, and of I. xiphioides are annually imported from Holland. In a deep and loose soil the roots of the tuberous and bulbous species of this genus are apt to run down when they cease to flower, and getting gradually weaker and weaker, are at last lost. To prevent this, Miller advises to form a stratum of rubbish about a foot and a half under the surface.
116. Morea. So named by Miller, in honor of Robert Moore, of Shrewsbury, a distinguished botanist, of whom there exists a memoir in the Philosophical Transactions. M. pavonia is one of the most elegant species of the genus. The bulbs of M. edulis are eaten at the Cape of Good Hope, both by men and monkeys; and those of M. sisyrinchium are eaten in Spain. Sweet recommends, as the best soil for these plants, "a mixture of sandy loam."
117. Maricn. A name perhaps obtained from सogaty, to become flaccid, in allusion to the nature of the

830 Beardless, leaves linear, Petals with glandular spots, Ovaries 3-cornered
831 Flower-stalks lateral nearly equal to the one-leaved involucrum
832 Leaves linear-lanceolate, Scape round shorter than the plaited leaves
833 Leaves linear-ensate flat, Scape simple leaf-like winged, Flowers opened out, Fil. united at base
834 Scape 2-edged, Flowers in spikes, Leaves sword-shaped nerved-plaited
835 Scape 2-edged leafy, Flowers in spikes, Petals roundish ovate acute, Leaves linear sword-shaped
836 Scape 2-edged simple nearly leafless, Spathe about 4-flowered unequal longer than the flowers, Pet. Muc.
837 Scape 2-edged branchy leafy, Spathe about 3-fow. unequal, Pet. linear acuminate, Leaves grassy channelled
838 Scape2-edged branched leafy, Spathe about 4-flow. shorter than the flowers, Pet. muc. Leaves sword-shaped
839 Scape 2-edged branched leafy, Spathe 3-flowered shorter that the flower, Leaves sword-shaped
840 Scape 2-edged ascending leafy, Spathe 3-flowered, Caps, hairy, Leaves capillary
841 Stigmas united petal shaped, Scape many-flowered erect, Spathe not viviparous
842 Leaves linear-lanc. nerved a little wavy at back, Fl.-stalks nearly as long as spathe, Flowers campanul.
843 Flowers spotted with orange
844 Culm round naked, Spikelets bundled in a roundish head, Involucr. 3,6 -leaved very long reflexed 845 Culm naked round, Spikelets in headed bundles, Invol. 2-leaved longer than the valves, Setæ none 846 Culm round leafy, Leaves channelled, Spike compound 2ranked longer than the bractea
847 Culm round naked, Spike compound, Flower monœcious, Leaves channelled rough
848 Culm round, Spikelets 2-3, Outer valve of involucrum as long as spikelets, Setæ several
849 Spike distichous, Spikelets many-flowered, Involucre 1-leaved, Culm roundish
850 Involucres very long white. (Dichromena, Vahl.)

851 Culm leafy 3-angular, Leaves linear keeled, Root creeping
852 Culm 3-angular, Leaves bristly channelled, Root creeping
853 Leaves flat glaucous with hairy sheaths, Invol. longer than the contracted panicle, Spikelets oblong, Scales oblong carinate mucronate
854 Spikes ovate oblong, Involucre about 3-leaved decompound longer than the umbel
855 Culms branched leafy flaccid, Spikelets few-flowered, Floating
856 Culm bristle-shaped, Spikelets lateral sessile
857 Culm round naked, Heads terminal globose clustered, Leaves channelled

858 Stem round sheathing at the base, Spike ovate terminal, Glumes obtuse equal, Root fibrous
859 Stigmas 3, Spike enclosed in a 2-leaved involucrum, Lower glumes very large as hig as the spike, Culm round, Sheaths bearded
860 Glumes unequal obt. ovate, one larger but shorter than the 2valved spike, Culm round, Sheaths not bearded 861 Culm round, Inner sheaths ending in a short leaf, Cyme terminal decompound with 2-4-leaved involucrum Spikelets ovate smooth
862 Top of the 3-angular stem straight, Upper sheaths leafy, Panic. lateral under the end, Spikel. sess, \& stalked 863 Culm straight naked pointed, Lateral spikes sessile or stalked, Stigma bifid
864 Top of the 3-cornered culm bent down at end, Sheaths leafless, Spikel, lateral sess. clustered naked, Stigmas 3 865 Culm naked, upwards 3-cornered, Panicle cymose terminal, Bract. pungent, Stigma bifid 866 Panicle globose terminal, Glumes mucronate torn bifid
867 Spikes roundish headed, Heads umbelled globose proliferous, Invol. many-leaved, Culm 3-angular
868 Culm 3-cornered leafy, Cyme term. supra-decompound surrounded with a many-leaved invol. Gl. mucronate
869 Spike oval naked, Scales lanceol. acute, Culms roundish, Sheaths leafless beardless lanceol. acure, Stigmas 2 870 Spike ovate naked, Two lower scales scarcely larger than the rest, Culms 4-cornered setaceous 871 Spike ovate naked, Scales oblong obtuse, Stigmas 2, Culms sub-compressed, Sheaths leafless, Root fibrous

123. Scirpus. From cirs, a Celtic word for rushes, which is, in the singular, cors, whence the Latin chorda S. cæspitosus is the principal food of cattle and sheep in the Highlands of Scotland in March and till the end of May. S. lacustris, the bull-rush, is used to bottom chairs: cut at one year old, it makes the finest bottoms; at two years, a coarser sort ; still older, and mixed with the leaves of Iris pseud-acorus, it makes the coarsest bottoms. Cottages are sometimes thatched, and pack-saddles stuffed with it, and in severe seasons cattle witl eat it. Of S. maritimus there are several varieties, natives of the salt marshes of Europe, Barbary, and Siberia, greedily eaten by cattle; and the roots, which are large, Withering says, have been ground and used instead of flour in times of scarcity. The Pi-tsi or water-chestnut of the Chinese, is a species of this genus (Scirpus tuberosus). It has not yet been introduced to our gardens. In China it is cultivated in tanks, the bottoms of which are manured and exposed for a time to dry in the sun. The tubers are eaten either boiled or raw, and are esteemed both as food and medicine.
124. Eleocharis. From Elos, a march, and chairo, to delight.

## History，Use，Propagation，Culture，

125．Eriophorum．From egsev，wool，and $\varnothing \in \rho$, to bear．Its seeds are covered with silky tufts of a wool－like substance．For the same reason it is called in English cotton－grass．
126．Trichophorum．From $\theta \rho \cdot{ }_{\xi}$ re‘ชos，hair，and $\phi \varepsilon \rho \omega$ ，to bear．Its inflorescence resembles a bunch of hair．This genus and Eriophorum grow in peat bogs，and have their seeds clothed at the base with a white or brown silky down or cotton－like substance，from which specimens of cloth have been made，paper，and wicks for can－ dles；and in Sweden，pillows stuffed．Of these genera，and of the Cyperaceæ in general，it has been observed by Villars，that being mostly natives of bogs，marshes，and watery places，they have a tendency to raise and dry such spots．The roots and base of the stems rot and become peat，and thus are useful as firing or manure．

127．Cyperus．The roots of some species of this genus have eatable roots，and are considered aphrodisiacal in a high degree．It is，therefore，probable that the word derived its origin from Cypris，a name of Venus．This is a genus of sub－aquatic or marsh sedgy plants，more injurious than useful，and of little or no beauty．The root of C．longus is agreeably aromatic，warm，and bitter ：those of C．esculentus（souchet comestible，Fr．）pro－ duce round tubercles about the size of peas，which are eaten in some places in France and Spain；and when boiled，taste something like chestnuts．

128．Papyrus．A word of obscure origin．P．antiquorum yields the substance used as paper by the ancient Egyptians．In Syria it is called babeer，and hence，probably，the words papyrus and paper．The flower－stalk rises about ten feet from a long horizontal thick root，the lower part clothed with long hollow sword－shaped leaves

872 Spike solitary, Culm very smooth, Sheaths inflated
873 Spikes several, Culms 3-cornered, Leaves broadish keeled
874 Spikes several, Culms 3-cornered, I.eaves very narrow setaceous
875 Spikes several, Culms round leafy, Spikes sessile clustered shorter than the involucrum
876 Spikes several, Culms 3-cornered, Leaves nearly filiform 3-cornered, Peduncles rough, Flowers erect
877 Spike solitary, Culms round spongy soft, Sheaths not inflated
878 Umbel compound, Culm branched
879 Spike solitary, Culms simple 3-cornered roughish
880 Head globose, Spikelets oblong convex about 8-flowered, Involucr. 4-leaved, Leaves channelled lax
881 Spikelets solitary and in pairs sessile, Involucr. 1-leaved, Culm setaceous
882 Spikelets ovate much clustered, Culm rather 3-cornered, Leaves channelled
883 Stem 3-cornered leafless ascending or decumbent, Spikelets about 5 oblong obtuse very shortly stalked
884 Heads simple and clustered ovate, Spikelets oblong, Involucr. very long
885 Spikes distichous, Spikelets spreading filiform, Florets distant, Umbel upright
886 Spikelets aggregate ovate rather squarrose in heads, Involucr. longer than umbel, Lvs, and involucr. rough 887 Umbels many rayed compound, Spikes elongate, Spikelets linear-lanceolate, Involucr. 4-leaved long 888 Lvs. linear shorter than the 3-cornered culm, Invol. 3-leaved, outer leaf very long, Spikel. lanc. Scales obtuse 889 Spikelets linear-lanceolate, Umbels corymbose fascicled, Involucr, about 6-leaved
890 Culm 3-cornered naked, Umbel 3-leaved supra-decompound, Spikes clustered rounded, Spikelets subulate 891 Spikelets about 3 linear, Valves obcordate mucronate distinct spreading, Umbel loose
892 Spikelets linear-lanc. alternate clustered, Glumes obtuse, Involucr. 3-leaved longer than the trifid umbel 893 Spikelets linear-lanc. alternate very close, Valves acute, Invol, about 3 or 5-leaved very long, Umbel 3-5-fid. 894 Spikes oblong loose, Spikelets subulate alternate capitate, Invol. very long spreading, Rays of umbel altern.
895 Spikelets lanceolate roundish headed compact, Valves ovate 1-nerved, Involucr. longer than the umbel 896 Spikelets lin.-lanc. distant acute, Rays of the umbel about 7 terminal shorter than the 3-5-leaved involucrum 897 Spikes corymb. Spikel. lin,-lanc, flattened, Invol. and rays of umbel very long corymbose with leafy stem 898 Spikes corymbose, Spikelets linear, Valves remote obtuse obovate spreading in fruit, Umbels loose 899 Spikes nearly sessile imbricated round, Spikelets ovate oblong spreading
900 Spikelets in corymbose fascicles, Spikelets linear-lanceolate dense, Invol. 3-leaved, Leaves very rough 901 Umb. 6-7-rayed compound, Heads many-spiked, Spikel. lin. many-flowered, Invol, 3-leaved reflexed rough

## 902 Stem tall terminated by a reflexed involucrum of many very long narrow leaves

903 Head globose sessile solitary, Involucr. very long
904 Umbel rather contracted, Invol. very long, Spikelets clustered, Valves ovate carmate acute
905 Head 1 or 3 sessile round, Invol. many leaved long, Valves carinate hooked
906 Heads about 3 sessile clustered, Spikelets very dense rather imbricated
907 Umbel compound, Spikes cylindrical imbricated backwards, Involucres many-leaved
908 Umbel compound, Spike cylindrical, Spikelets very spreading, Bractes longer than the spikelets
909 Leaves shorter than the 3-cornered culm rough at edge, Umb. contracted, Invol. many-leaved, Spikel. subreffexed, Scales keeled striated
910 Spikes cylindrical sessile, Spikelets oblong, Bract setaceous longer than spikelets, Invol, many-leaved
911 Common peduncle shorter than the spikes

and Miscellaneous Parliculars.
of a brown color. The ancients made their paper from the pellicle found between the flesh and bark of the thick part of the stalk; ribbons of which were united till they formed the size required, and then pressed and dried in the sun. The top of the stalk, with the umbel of flowers, adorned the temples, and crowned the statues of the gods. Antigonus used the stalks for ropes and cables to his fleets, before the use of spartum (Lygeum spartum, still used on the coast of Provence for small vessels, and also in Spain) was known, Pliny says, the whole plant was used for making boats; and Bruce says, they have no other boat in Abyssinia. That traveller found it growing in the rapid course of the river Jordan, and he there remarked that it constantly opposed one of the angles of its stem to the current, as if to elude the violence of the waves. Perhaps, if the observation were applied to similar plants in our own rivers, the same result would be obtained. The root was chewed for its juice, which is also practised in Abyssinia with various species of cyperus, and with those of maize. The papyrus is indigenous in Calabria as well as in Ethiopia and Egypt, in stagnant water; but only in the calishes or swamps of the Nile, and never in the stream as has been supposed. To thrive in our stoves, it requires to be placed in a cistern of water with rich mud at the bottom. Plants so treated, at White Knights, near Reading, have attained a large size, and flower freely.
129. Kyllinga. In memory of P. Kylling, a Danish botanist, who died in 1696.
130. Mariscus. A word derived from the Celtic mar, a marsh, in allusion to the situations in which it is found.
131. Remirca. The Guiana name of the plant.

History，Use，Propagation，Culture，
132．Lygeum．From $\lambda$ voow，to bend，in allusion to its flexibility．This plant is used in Spain，Provence，and other places for making ropes，baskets，nets，and for filling their paillasses or lower mattrasses．Ropes were made of it by the Romans．Esparto（spartum）is the Spanish appellation of this and other grasses used for si－ milar purposes．

133．Cornucopia．The spike inclosed in the involucrum peculiar to the genus，resembles the＂Horn of Plenty．＂The leaves and flower of C，cucullatum，Sir J．E．Smith observes，are perhaps of all grasses the most singular and uncommon．It is a native of the vales about Smyrna，whence it was sent to England by Sherard， and is preserved in the Chelsea garden and at Kew．

134．Cenchrus．K $\leqslant$ repos is the Greek name of the millet；by which，it is probable，that Setaria italica was intended．C．echinatus is the most common grass in the pastures of Jamaica，and is looked on as a wholesome and pleasant food for horses and cattle．

135．Pennisctum．From penna，a pen，and seta，a bristle；a feathery bristle，referring to the nature of the involucrum．

136．Spartina．A word altered from spartum，the specific appellation of Lygeum；the plants being sumilar to the latter in habit．The origin of the word spartum has not been satisfactorily explained．The Spaniards call this，and similar tough grasses，useful to them in making ropes，esparto．

137．Nardus．The term vagठos was applied by the Greeks to a substance possessing a peculiar per－

## 912 The only species

913 The only species
914 Branches of the panicle simple, Paleæ hispid backwards, Glumes 3-valved 2-flowered (Centothecr. Desv.) 915 Spikelets approximated, Involucres 10 -parted villous
916 Spike with alternate spikelets, Involucres entire spiny
917 Culm jointed, Invol. altern. twice as long as flowers, one of the setæ bristle-chaffy longer than the others
918 Spikes term. about 2, Spikelets one-sided loosely imbricated Paleæ longer than glume, Leaves involute 919 Spikes altern. remote, Rachis ang, wavy, Glumes twice as long as paleæ, Leaves very long glaucous flat 920 Leaves broad flat, Spikes many turned all ways linear, Kcels aculeate
921 Leaves distichous shortish bristly convol. Spikes few remote spreading, Glumes acuminate, Keels rough
922 Spike bristly straight one-sided
923 The only species

## DIGYNIA.

924 Spikes few altern. Rachis flat straight as long as spikel. Glumes roundish obtuse smooth, Upper Ivs. naked 925 Spikes very num. Rachis 3-sided smooth twice as narr. as spikel. Glumes roundish obv. blunt pub. 3-nerv. 926 Spikes numerous scattered, Rachis undulated broader than spikelets, Glumes oblong corrugated, Leaves lanceolate rough at edge
927 Spikes 2 close together, Rachis flat narrower than spikelets, Glumes ovate obtuse polished length of pilea 928 Spikes 5 close together, Rachis flat rather broader than spikelets, Glumes elliptic lanc. acute pubescent

929 Panicles umbelled, Racemes about 4, One glume fringed
930 Panicles diffuse, Florets beardless ovate dispersed
931 Pan. spreading lax few-flowered, Flowers bearded, Each glume at least 3-nerved (Piptatherum. P. de B.) 932 Panicles sprending many-flowered, Flowers bearded, Outer glume 3-5-nerved
933 Flowers panicled bearded, Beard shorter than glume
934 Stem shrubby at base, Panicle whorled, Lower rays sterile
935 The only species. The least of grasses
936 Spikes digitate erect spreading 4, Leaves and sheaths pilose, Florets oblong pubescent at edge
937 Spikes many setaceous, Leaves and sheaths very hairy
938 Spikes digitate erect 7, Leaves and sheaths hairy, Florets oblong acute smooth
939 Spikes digitate erect spreading 8, Leaves and sheaths hairy, Florets lanceolate ciliated 940 Stem decumbent, Sheaths hairy at end, Spikes divaricate, Paleæ fringed at end

941 Spikes alternate one-sided beardless ovate rough, Rachis roundish
942 Spikes alternate sessile one-sided, Glumes two much shorter than paleæ retuse, The third as long as they 943 Spikes panicled alternate erect in bunches, Spikelets one-sided roundish
944 Very smooth, Panicles oblong erect, Glumes striated largish, Stem branching

and Miscellaneous Particulars.
fume. It is difficult to assign a reason for the name having been applied to this insignificant genus of grasses.
138. Oryzopsis. Oryza, rice, and outs, appearance. The plant resembles rice.
139. Paspalum. One of the Greek names for millet, $\pi \propto \sigma \pi \alpha \lambda o s$.
140. Axonopus. From $\alpha \xi \omega y$, axis, and $\pi 85$, a foot, because the chief difference between this genus and Paspalum consists in the spikes being separately placed, as it were, upon little stalks or feet.
141. Milium. Derived by some from mille, a thousand, on account of its numerous grains; by others, from $m i l$, the Celtic for a pebble, in reference to the hard shining nature of the grains. M. effusum is admired for the elegance of its panicle. M, paradoxum resembles the Arundo.
142. Knappia. Named after Mr. Knapp, an author of an illustrated work upon British grasses,\&rc., much esteemed. A minute plant, resembling an agrostis.
143. Digitaria. From digitus, a finger, on account of the singular manner in which the heads are divided; or, as the botanists express it, fingered. D. sanguinalis has its specific name, not from the color as might be supposed, but from an idle trick which the loys in some parts of Germany have of pricking one another's nostrils with its spikelets till they bleed. It abounds by the road sides in Poland and Lithuania, where its seeds are collected and boiled whole like rice, with milk, and highly esteemed
144. Panicum. Pliny says, so called, from its flowers being in a panicle; but others derive the name frons

History，Use，Propagation，Culture，
panis，bread，because of its uses as such．Of P．miliaceum there are two varieties，the brown and yellow．They are sometimes sown in this country for feeding poultry，and for having the husk taken off，to be used as rice；but the ample supplies received from the shores of the Mediterranean，render the culture of the plant unnecassary P．arborescens，is said，by Linnæus，to contend for height with the loftiest trees in the East In－ dies，though the culm is scarcely thicker than a goose quill．This culm resembles that of Commelina，and shoots up through the branches of trees in woods and jungles．

145．Setaria．From seta，a bristle，on account of the bristles of the involucrum．S．italica is frequently called millet，and its seeds are used for the same purposes．S．germanica is cultivated in Hungary as food for horses， for which it is preferred before all other grasses．The seeds may be used as millet．Sparrows are remarkably fond of the seeds of $S$ ．viridis ；and，according to Curtis，this and the two preceding genera，when cultivated in gardens，require to be protected from them from the time they come into flower．
146．Echinochloa．From $\varepsilon \chi^{1 v o s,}$ a hedge－hog，and $\chi^{\lambda o m}$ ，a grass，on account of the prickly appearance of the heads of flowers．E．crus－galli is a coarse grass which grows thick and close，and stands dry weather better than most others．

945 Spikes 23 together erect, Glumes hispid with two beards
946 Panicles spreading, Stamens and pistils coloured, Stem branching
947 Panicles twiggy, Leaves divaricating
948 Panicles lax nodding, Spikelets beardless, Leaves lanceolate pilose, Sheaths hirsute, Valves mucronate
949 Panicles spreading, Flowers solitary muricated, Stem rooting ascending
950 Panicles capillary erect spreading, Pedunc. straight, Glumes acuminate smooth, Sheaths very hairy
951 Panicles with simple lateral racemes, Leaves ovate lanceolate hairy at the neck
952 Panicles few axillary, Stem dichotomous, Sheaths dotted
953 Panicle much branched, Leaves ovate oblong acuminate, Shrubby
954 Panicles branched diffuse, Glumes acuminate smooth gaping, Leaves reedy
955 Panicles oblong flexuose capiliary spreading, Glumes two-fowered, Leaves linear-lanc. Stem creeping
956 Panicled, Sheaths of the leaves ciliated lengthwise
957 Pan. short beardless, Stem much branched divaricating, Flower-stalks 2-flow. one shorter than the other
958 Panicles simple upright, Spikelets appressed, Leaves oblong lined plaited, Sheaths pubescent
959 Pan. spiked whorl, Invol, 1-fl. with hairs in bundles toothed hispid, teeth reversed, Herm, paleæ smoothish 960 Raceme spiked cylind. Invol, 2-fl. with hairs in bundles, hispid above, Herm. paleæ wavy crosswise
961 Pan. spiked cylind. Invol. 2fl. with hairs in bundles, hispid above, Herm, paleæ smoothish, Sheaths downy
962 Spike comp. interrupted at base nodding, Spikelets heaped, Invol, setaceous much longer than fower
963 Spike comp. Spikelets panicled in bundles, Bristles mixed with the forets very long, Pedunc. smoothish 964 Spike round, Involucres setaceous villous 1-flowered as long as florets, Leaves flat
965 Spike compound contracted, Spikelets heaped, Invol. setaceous longer than the flowers, Rachis hairy 966 Spike elongated cylind. Invol. 2 fl. bristly, Herm. palea smoothish, Stem ascending, Sheaths smooth 967 Stem brancined, Sheaths pubescent, Spike dense short, Setæ none, Paleæ smooth
968 Spike compound erect, Clusters remote, the lowest sessile, Setæ 8 times as big as florets
969 Sheaths very rough, Spike simple with naked setæ longer than florets
970 Spikes one-sided alternate, Glumes 2-ft. bearded hispid
971 Spikes alternate one-sided, Spikelets subdivided, Glumes bearded hispid, Rachis triangular
972 Spikes alternate and in pairs, Spikelets subdivided, Glumes bearded hispid, Rachis 5-angular

973 Spike compound, Spikelets appressed alternate, Glumes torn, All the valves bearded outer largest
974 Bundles about ten, Rachis very hairy, Glumes bearded smooth a little fringed, Leaves ovate acum. wavy
975 Joints of the stem snooth, Involucres ciliated
976 Joints of the stem villous, Involucres rough
977 The only species
978 Beard feathered
979 Flowers panicled spiked nearly included in the sheaths, Beard feathered
980 Beard naked straight, Glumes longer than the seed, Leaves smooth inside
981 Panicled, Beards naked twice as long as glumes, Seeds woolly
982 Beard naked rough twisted in various directions
983 Beard hairy at base, Panicle spiked, Leaves filiform
984 Panicles branched compressed, Leaves linear smooth, Stem diffuse

985 The only species. A plant looking like a Polypogon
986 The only species

and Miscellaneous Particulars.
147. Orthopogon. $\mathrm{O}_{\xi}$, $\sigma$ os, straight, and $\pi \omega y \omega y$, a beard, because the beards of the flower are straight, and not jointed. This plant is cultivated in the low and marshy lands of Jamaica as fodder.
148. Penicillaria. From penicillus, a pencil, in allusion to the soft hairy appearance of the spikes.
149. Lappago. The flowers are rough, with little prickles like Lappa or Burdock.
150. Stipa. From sumv, silky or feathery material. S. pennata has beautifully feathered beards which distinguish it from all other grasses. Gerarde says, they were worn in his time by "sundry lacies instead of feathers." S. tenacissima is used in Spain for the same purposes as Lygeum spartum, and like it, is called Esparto. It is supposed by some to be the plant so called by the ancients.
151. Muhlenbergia. Named in honor of Dr. Muhlenberg, an eminent North American botanist. A North American genus of grasses.
152. Chceturus. From $\chi \propto i \tau \kappa$, a head of hair, and $\varepsilon \rho \alpha$, a tail. So named by Link, from the silky appearance of the panicles.
153. Lagurus; $\lambda \alpha \gamma \circ 5$, a hare, and ug, a tail ; hare's-tail, which its heads resemble.

History，Use，Propagation，c＇ulture，
154．Polypogon．Named by M．Desfontaines from roiv，much，and twy $\boldsymbol{\pi}$ ，beard，in allusion to its bearded heads．
155．Gastridium．From varซ̧sioy，a little swelling：the glumes are ventricose at the base．A yery small grass，formerly referred to Milium．

156．Agrostis．Derived from $\dot{\alpha} \gamma \operatorname{los}$, a field，Agrostis was the name given by the Greeks to all grasses． Of this genus the most remarkable species is the $A$ ．stolonifera or fiorin，so much recommended by Dr． Fichardson；but respecting which the opinion of practical men is still unsettled，and，on the whole，rather un－ favorable than otherwise．It seems to suit the climate and soil of Ireland，and to be more productive and nutritive there than any where else．In the account of the Woburn experiments on grasses，it is observed of fiorin，that it appears to possess＂merits well worthy of attention，though，perhaps，not so great as has been supposed，if the natural place of its growth and habits be impartially taken into the account．＂It is called squitch，quick，\＆c． like the common couch－grass，from the length of time it retains its vital power．Like other plants，which pro－ pagate themselves abundantly by extension of their parts，it rarely bears seeds，and is therefore propagated by cuttings of the stems laid along drills an inch deep，and slightly covered with soil．A．vulgaris，which in dry arable land is called the black quitch，is the most common and earliest of the bents，but inferior to several in produce，and the quantity of nutritive matter it affords．The bents are generally rejected by the agricul－ turist on account of their lateness of flowering；but this circumstance，as Sinclair observes（Davy＇s Agr．Chem． App．lxxv．）does not always imply a proportional lateness of foliage．A．vulgaris is in leaf by the middle of April．A．stolonifera is two weeks later，and A．nivea，and repens，three weeks later．In the south of France and Italy，the poor people collect the stolons of different species of agrostis by the roadsides and hedges，and expose them for sale in the market places in small bundles，as food for horses．

987 Panicle contracted, somewhat spiked, Glumes somewhat pubescent with a smooth edge
988 Panicle spiked ventricose at base, Glumes acuminate shining, Flowers bearded
989 Flowers beardless
990 Panicle whorled spreading, Beard very long below the end of the outer paleæ (Apera P. de B.)
991 Panicle much spreading, Beard bent inwards, Paleæ hairy, Culm ascending branched at the base
992 Glumes linear-lanc, bearded, Paleæ naked, Beard nearly term. straight, Culm decumbent (Vilfa P. de B.)
993 Branches of pan. smoothish, Branchlets at the time of flow, divar. Ligula very short trunc. (Vilfa P. de B.) 994 Branches of pan. hispid, Fl. purple, Branchlets much spreading rather lax, Ligula oblong (Vilfa P. de B.) 995 Pan. contracted, Culm branched creeping, Flowers clustered, Glumes equal lanc. pubesc. (Vilfa P. de B.) 996 Branches of pan. hispid, Fl. white, Branchl. much spreading rather lax, Ligula oblong (Vilfa P. de B.) 997 Whorls of the pan, approxim. closely covered all over with flowers, Florets beardless (Vilfa P. de B.)
998 Panicle contracted beardless, Glumes equal, Flowers viviparous (Vilfa P. de B.)
999 Beard term. curved, Hars longer than paleæ, Panicle diffused, Glumes acumin. (Achnatherum P. de B.)
1000 Pan. very branching, Branches trichot. much sprdg. hispid, Glumes acute, Paleæ beardless, Stem decumb. 1001 Branches of panicle di-trichotomous roughish, Glumes acute, Leaves of stem wider than those of root 1002 Branches of panicle nearly 3-chotomous roughish, Giumes acuminate, Paleæ with two short beards at end 1003 Glumes lanceolate, Paleæ with a jointed beard at their base, Radical leaves setaceous 1004 Culms erect, Leaves narrow short, Sheaths roughish, Panicle very capillary and loose

## 1005 A little agrostis-like plant. The only species

1006 Panicle contracted beardless, Racemes lateral erect alternate
1007 Pan. elong. contr, nearly spiked, Florets beardless, Glumes uneq. twice as short as paleæ which are uneq.
1008 Panicle spreading, with a setaceous involucre, Florets beardless
1009 Panicle contracted beardless, Flowers acuminate often monandrous, Leaves flat rough 1010 Panicle much branched oblong close, Branches erect, Paleæ beardletted, Ligula torn

1011 Panicle spiked, Glumes acute, Hairs 3 times as short as paleæ, Leaves involute

1012 Stems branched compressed, Panicle spiked hemisphærical surrounded by a leafy involucre, Diandrous 1013 Stems branched compressed, Panicle spiked oblong sheathed at base, Triandrous

1014 Stem erect, Spike very simple attenuated, Glumes distinct villous, Root bulbous
1015 Stem erect smooth, Pan. subspiked cylindrical obtuse thick, Glumes fringed connate below the middle
1016 Stem erect smooth, Spike ovate, Glumes villous bearded nearly as long as the beard of the paleæ
1017 Stem generally erect roughish upwards, Panicle spiked cylind. acute, Glumes connate below the middle

and Miscellaneous Parliculars.
157. Trichodium. Named from $0 \rho \iota_{\zeta}$ r $\sigma \cdot \chi 05$, hair, on account of its capillary inflorescence. T. decumbens is the famous Agrostis cornucopiæ of Frazer, respecting which so much was said some years ago; but which upan trial did not prove so valuable an agricultural grass as it was represented to be.
158. Tristegis From $\tau \xi \xi / 5$, three, and $\mathcal{F} \gamma \eta$, a covering, on account of the three glumes or valves of the calyx. 159. Sporobolus. From $\sigma$ rogos, a seed, and $\beta \omega \lambda \lambda \omega \omega$, to cast forth. Its grains are loose, and easily fall out of their husks,
160. Airopsis. A word formed by M. Desvaux, from Aira, and $0 \notin 15$, like. The genus resembles Aira in appearance.
161. Cinna. An ancient name used by Dioscorides, who ascribes heating and stimulating qualities to this grass when eaten by cattle, whence the name (from $\approx s \%$, to heat). Linnæus applied it to this genus of American grasses.
162. Psamma. From $\psi \alpha \mu \mu \alpha$, sand, in which this grass grows in vast abundance on the sea-coasts of Europe. P. arenarium has a strong creeping perennial root with many tubers at the joints, the size of a pean It is planted and encouraged on the coast of Norfolk to aid in fixing the sand against the action of the wind and tides, which it effects in a surprising manner. The marrum, as it is called, is considered of so much importance that there are severe laws to prohibit its being destroyed. Mats are made of it, and it is used as thatch.
163. Crypsis. From ॠŋцт $\tau \omega$, to conceal; the heads of flowers being at one time concealed in the sheaths of the leaves.
164. Alopecurus. A $\omega \boldsymbol{\sigma} \eta \xi$, a fox, and $8 \rho \alpha$, a tail : fox-tail. A. pratensis is one of the best of meadow-grasses, possessing the three great requisites of quantity, quality, and earliness, in a superior degree to any other. It is

History, Use, Propagation, Culture,
often fit for the scythe by the midale of May; it flowers twice a-year, and gives more bulk and weight of hay than any other grass. At Woburn the produce was nearly three-fourths greater from a clayey loam than from a sandy soil, and the grass from the latter was of comparatively less value in the proportion of four to six. What is almost peculiar to this grass, Poa pratensis and Anthoxanthum odoratum, the value of the grass of the latter math considerably exceeds that of the crop at the time of first flowering. A. geniculatus, and most of the other species of this genus (A. agrestis excepted) are valuable grasses both for hay and pasture.
165. Phleum. We have no information as to what the $\varphi \lambda$ tos of the Greeks was. The name being unoccupied has been applied by Linnæus to this plant. Some think the plant of the ancients was our Typha. P. pratense, the timothy-grass (so named from Timothy Hanson, who brought it from New York and Carolina about 1730), varies much in size according to soil and situation, and the root becomes bulbous in very dry grounds. Opinions are different as to its merits. Dr. Walker (Rural Econ. Hebrides, ii. 27.) thinks it may be introduced into the Highlands with good effect. W. Salisbury says, it is coarse and late. At Woburn, its "comparative merits were considered very great. It produces abundance of fine foliage early in spring, which, as it flowers late, may be cropped till an advanced period of the season without injury to the crop of hay." Unlike the Alopecurus pratensis, the value of the grass as hay when the seed is ripe is to that when it is in flower as 10 to 23. P. nodosum has gibbous joints, which might have been expected to be sugary like those of Fiorin, which, however, is not the case, as Sir H. Davy found them to be less nutritive than those of P. pratense, in the proportion of 8 to 28 .
166. Achnodonton. From $\alpha_{\chi} y \eta$, a chaff or husk, and $\dot{\delta} 8 \boxed{,}$, a tooth, in allusion to the toothed paleæ or inner valves of the flower.
167. Chilochloa. A genus formed by M. de Beauvois, to contain certain grasses referable to both Phalaris and Phleum, as formerly constituted. The name is derived from $\chi^{s \lambda o s}$, fodder, and $\chi^{\lambda o n}$, grass; but none of the species are remarkable for their qualities as grasses useful in husbandry.

1018 Stem ascending knee-jointed, Panicle spiked cylindrical obtuse, Glumes connate at base obtuse
1019 Stem ascending knee-jointed, Spike compound cylindrical, Glumes obtuse fringed, Anthers orange col. 1020 Stem ascend, Raceme spiked ov. Glumes with a hairy keel beyond the mid. dilated, Upper sheath inflated 1021 Stem erect, Pan. spiked cylind, atten. at base, Glumes vill, fringed, Beards of paleæ twice as long as glumes

1022 Raceme spiked cylindrical, Glumes truncate mucronate with a fringed keel, Beard shorter than glume 1023 Raceme spiked ovate oblong, Glumes truncate muczonate with a fringed keel, Beard as long as glume 1024 Like P. pratense, but stems lower, Raceme shorter, hoot knotty. A mere variety
1025 Spike ovate, Beard longer than glume divaricate angular rough, Root fibrous
1026 Panicle hairy spiked cylindrical, Glumes lanceolate acuminate with a fringed keel
1027 Glumes keeled smooth membranous at edge
1028 Outer glume a little prickly at the back
1029 Panicle spiked cylindrical smooth, Glumes lanceolate mucronate obtuse roughish
1030 Panicle spiked oblong ovate, Glumes lanceolate acute with a fringed keel, Stems ascending
1031 Panicle spiked cylindrical, Glumes wedge-shaped mucronate rough

1032 Panicle spreading heaped, Outer paleæ pencilform, inner shining
1033 Panicle spiked ovate, Glumes navicular entire at the end, Outer paleæ 2
1034 Panicle spiked oblong ovate, Glumes navicular toothed at end, Outer palea 1
1035 Panicle spiked oblong, Glumes navicular nearly entire, Outer palea 1, Stem knee-jointed
1036 Stem naked upwards, Spike slender lax, Glumes keeled acute
1037 Pan. spiked cylindrical, Intermediate floret hermaphrodite acuminate, the rest imperfect bitten off 1038 Panicle diffuse, Glumes acute shorter than florets, One floret hermaphrodite, one neuter
1039 Panicle beardless cylindrical spiked, Paleæ 2 smooth, Root bulbous

## 1040 Pan. spreading afterwards contracted, Florets less than glume, Beard clavate less than glume

1041 Pan. diffuse, Glumes obtuse, Florets longer than glumes (Catabrosa P. de B.)
1042 Panicle diffuse, Florets as long as glumes, Beard straight short, Leaves flat (Deschampsia P. de B.) 1043 Pan. contr. Glumes bearded villous at base, Rachis smooth very short, Leaves flat (Deschampsia P. de B.) 1044 Beardless, Panicle lanceolate lax erect, One floret stalked the other sessile, Leaves pubescent
1045 Leaves bristly, Stem naked, Panicle lax, Florets hairy at base, Beard nearly terminal shorter
1046 Pan. divar, Branches trichot. Flor. 3-fl. larger than glumes, Beard jointed longer than glumes, Leaves set. 1047 Bearded, Pan. spreading trichot. Pedunc. wavy, Florets scarcely longer than glume, Leaves setaceous 1048 Bearded, Pan. trichot, divar. Florets less than glume, Beard dorsal jointed longer than glume

1049 Pan. one-sided, Spikelets short 2-flowered, Florets as long as glume obtuse 2-toothed at end, Root fibrous 1050 Pan. 1-sided contracted, Spikelets 2-fl. less than glumes, One foret beardless, Root fibrous

and Miscellaneous Particulars.
168. Phalaris. An ancient name said to have arisen out of $\varphi \propto \lambda$, grains. P. canariensis is cultivated for the seeds, which are given to singing birds, and more especially the canary. It requires a loamy soil, well manured, clean, and in good tilth. The grain is sown in February, in drills, six inches apart, and the plants are thinned to two inches distance in the rows. The growth of canary grass is slower than that of the common weeds, with which it is in consequence liable to be overrun, if they are not kept under by hoeing and hand-weeding. The culture of this grass is chiefly carried on in the isle of Thanet, where the chaff is esteemed as a horse food; but the straw being short, it produces little fodder or manure.
169. Corynephorus. From sogevn, a club, and $\varphi \varepsilon \rho \omega$, to bear. The beard is jointed, and the last articulation is club-shaped.
170. Aira, is the name applied by the Greeks to the Lolium of the Romans, our Lolium temulentum. It signifies "something deadly," in allusion to the dangerous effects of that plant; but the name has no reference to any species of the genus to which it has been applied by Linnæus. A. aquatica is relished by cattle, and water-fowl are fond of the young shoots and seeds. It is introduced in decoys, by throwing plants in the water with a weight tied to them. A. cæspitosa is common in marsh-meadows, and occasions those excrescences called tussocks or hassocks which interrupt the progress of the scythe. Though cows eat the grass, horses will not. The stiff erect stalks frequently bear viviparous flowers.
171. Avena. A name of obscure origin. De Théis thinks it has been derived from the Celtic word aten, which comes from etan, to eat; and whence our common word ait, oat, has been obtained. A. sativa is the common cultivated oat, and A. nuda and tartarica are also sometimes cultivated. Of the first species there are numerous varieties, some more permanent, as the white and black; others temporary, as the potatoe oat, Angus oat, \&c. No botanist has been able to ascertain satisfactorily the native place of this or any other of our cultivated grains. A. fatua is accounted a distinct species; but some think the naked, tartarian, common,

History，Use，Propagation，Culture，
and wild oat originally the same．The wild oat is remarkable for the length of time the grain will lie in the soil，and retain its vegetative powers；its awns are sometimes used as hygrometers，and its seeds as artificial flies in fishing．Where it abounds naturally it is an inveterate weed．

The oat，in an agricultural point of view，is a grain only calculated for cold climates．In Italy and France， and even in the southern counties of England，the ears are small and husky，and afford little meal ；the panicle is open，and the foot－stalks of the ears small；and in July and August the heat dries them up，and obstructs the progress of the sap to the grain．On the other hand，this naked airy panicle is better for drying after rains and dews than the close spikes of wheat and barley，which，while they serve to guard the ears from the extremes of heat in warm climates，are apt to rot or become mouldy（covered with fungi）in cold moist countries or sea－ sons．The grain of the oat，though chiefly used as food for horses，is also more or less a bread corn in every country where it is generally cultivated．Fourteen pounds of grain yield eight pounds of meal ；in some places， as Yorkshire and Aberdeenshire，this meal is ground nearly as fine as flour ；in others，as at Edinburgh，it is made of a coarser quality．The kernel freed from the husk，and entire，is used for gruels，and forms an article of commerce with Embden，Bremen，and some towns where the grains are grown to a large size on the variety known as the Friesland oat．The fine powder which is produced by the operation of husking the corn，or making grist，forms a jelly，the sowens of the Scotch，and furmerty of the Irish，an agreeable and wholesome food．Water－gruel from a coarse oatmeal，is esteemed a cooling laxative drink．

A．nuda，the naked，or hill－oat，or peel－corn，when ripe drops the grains from the husks．It was generally cultivated in Worlige＇s time＂in the north of England，Scotland，and Wales，because the kernel threshes clean out of the husk，and need not be carried to the mill to be made into meal or grist．＂It was made into meal by the lower classes，by drying on the hearth，and bruising in a stone mortar，as still practised in the Highlands of Scotland，in Lapland，Ceylon，China，and in every country under certain circumstances of civilization．In the low country of Scotland，the quern mills，as they were called，now no longer in use，may be seen neglected or dilapidated，by the doors or alout the gardens of cottages and villages，where they were formerly in use．
Avena sterilis is sometimes grown as an object of curiosity，under the name of the animal oat，on account of its singular hygrometrical properties．After the seeds have fallen off，the strong beard is so sensible of aiter－

1077 Raceme spiked ovate nearly naked, Spikelets 2-flowered, Bractes toothletted, Outer palea 5-bearded 1078 Raceme in a round head, Outer palea with one beard, Leaves fine keeled

and Miscellancous Particulars.
ation in the atmosphere as to keep them in an apparently spontaneous motion, when they resemble some grotesque insect crawling on the ground.
172. Trisetum. (Three bristles); on account of the three beards or awns of the fower. Trisetum puipescens, according to the Woburn experiments (vii.), possesses several good qualities, which recommend it to particular notice. It is hardy, early, and more productive than many others which affect similar soils and situations. It appears well calculated for permanent pasture on rich light soils. Trisetum flavescens is also a useful grass; but the most valuable as a grass is the Avena elatior, L. the Holcus avenaceus of Eng. Bot., which will be noticed hereafter in its proper place. (In Polygamia monœecia, under Arrkenatherum).
173. Danthonia. A genus containing some incongruous species of Avena, and named after M. Danthoine, a French botanist.
174. Gaudinia. Named in honor of M. Gaudin, a Swiss botanist, who paid great attention to the study of grasses, and who published an Agrostographia Helvetica in 1811, still a work of reputation.
175. Arundo. An ancient name of doubtful origin; perhaps, as a recent author conjectures, from aru, the
 Rohr, Ger., and Canni di Giardini, Ital. is common in the south of France and Italy, where it is cultivated as fence-wood, for supporting the vine, for fishing-rods, and a great variety of purposes. In Spain and Portugal it forms an article of commerce, and supplies materials for the looms, fishing-rods, \&c. of this country. The striped-leaved variety (gardener's garters) used formerly to be a common inhabitant of gardens.
A. phragmites, Roseau de Marais, Fr. Gemeine Rohr, Ger.; and Conna palustre, Ital. is used for thatching, for protecting embankments or sea-dykes, for ceilings to cottages, verandahs, and rustic buildings; to lay across the frame of wood work as the foundation for plaister floors, and for screens and hot-bed covers in kitchen gardens. The panicles will dye wool green; and the roots, it is said, are good in liver complaints, like those of Triticum repens.
176. Chrysurus. From xevoos, gold, and şò, a tail ; the compact heads of flowers are of a bright yellow color.
177. Sesleria. A genus named by Scopoli, after Leonard Sesler, a physician and botanist, who contributed to

History，Use，Propagation，Culture，
Vitaliano Donati＇s Natural History of the Adriatic sea，published in 1750．The species were formerly part of Cynosurus．

178．Cynosurus．Kuwy revos，a dog，and чৎф，a tail ：dog＇s－tail．
179．Koleria．Named after M．Kohler，a professor of natural history at Mayence，and author of some works upon grasses．A pretty genus of grasses，with elegant silky heads．

180．Dactylis．（ $\Delta x \approx \tau u \lambda o s$, a finger：finger－grass）．The divisions of its heads may be fancied to resemble the fingers，and the large cluster at the bottom the thumb of an animal．D．glomerata is a coarse grass of early and rapid growth，and considered valuable as a pasture grass on light soils from the quantity of herbage it af－ fords．It comes in from the time turnips are over，till the meadows are fit for grazing；but old and dry，or made into hay，neither horses nor cattle are fond of it．To reap the full benefit of this grass，it must be kept closely cropt．It has been of late strongly recommended by Mr．Coke of Holkham．
181．Glyceria．（From rauぇus，sweet，in allusion to the herbage）．This is the Festuca fluitans of L．：it is found in stagnant water，and its long narrow leaves float on the surface．Horses，cattle，and swine are fond of this grass，which produces abundance of seeds，which are eaten greedily by geese，ducks，and fish，especially the trout（Salmo fario）．These seeds are very nourishing，and are collected in some parts of Germany and Poland， under the name of manna seeds，and used in soups and gruels．The plant will not thrive unless on land that is constantly under water．

182．Festuca．In Celtic，the word fest signifies pasture，food．We may be satisfied with this explanation in want of a better．This genus affords some valuable hay and pasture grasses．F．ovina has a fine short sweet foliage，well adapted to the masticating organs of sheep，and for producing delicate mutton：it is totally unfit for hay，and according to Sir H．Davy＇s experiments，it does not possess the nutritive powers generally ascribed to it．It is an excellent grass for lawns，requiring little mowing，and forming so thick a turf as to suffer few intruding plants．It should be sown about the middle of August，on ground nicely prepared，open，and not too light or dry．The same remarks will apply to F．rubra and amethystina．

## 1079 Raceme spiked linear, Spikelets beardless, Bractes pinnatifid, Leaves linear

1080 Pan. spikeshaped at the base interrupted and smoothish, Spikelets 3-4-flow. nearly beardless very acute 1081 Pan. closely spiked, Spikel. 2-3-ft. acum. beardless, Glumes fringed at back, Lower leaves conv. setaceous 1082 Pan, spiked oval cylind. Spikelets 2-flowered villous at back acumin. Outer glume bearded under the end 1083 Panicle spiked cylind. Spikel. 2-5-8-flowered, Outer glume rough outside, with a soft beard under the end 1084 Panicle spiked ovate cylind. Spikelets 3-4-flowered, Outer glume hairy with a stiff beard under the end

1085 Panicle one-sided heaped, Leaves keeled
1086 Panicle one-sided headed spiked, Spikelets 3-flowered, Leaves keeled glaucous
1087 Panicle equal before and after flowering contr. spiked, Spikelets 4 -fl. beardless, Glumes with a rough keel 1088 Stem creeping, Branches in bundles, Leaves villous subulate stiff, Flowers in spiked one-sided heads 1089 Spikes scattered one-sided few, Flowers closely imbricated, Leaves much spreading, Stem decumbent

1090 The only species is a floating creeping plant very common in ponds
1091 Panicle simple one-sided, Spikelets about 9-flow. bearded, Leaves setaceous, Culm upwards 4-cornered 1092 Panicle contracted, Spikelets ovate 4-flowered, Paleæ roundish, Leaves very narrow rough
1093 Panicle one-sided contracted, Florets compressed beardless pubescent, Leaves setaceous smooth
1094 Pan. one-sided erect spreading, Florets roundish longer than beard, Leaves pubes. above, Root creeping 1095 Panicle erect spreading, Florets longer than beard, Root fibrous
1096 Pan. sprdg. Spikel. obl. nearly beardl. Outer valve of glume and paleæ ciliated, Lvs. setac. rigid, Lig. 2-eared 1097 Glaucous, Pan. 1-sided contracted, Florets cylind. bearded, Stem square, Leaves compound channelled 1098 Panicle spike-shaped pubescent, Leaves filiform
1099 Panicle one-sided erect branching contracted, Florets oblong angular beardless, Leaves ensiform striated 1100 Panicle spreading, Spikelets 3 -flowered with long beards
1101 Panicle erect, Spikelets ovate 4-5-flowered, Glumes acum, beardless, Leaves setaceous smooth pungent
1102 Panicle spreading branched, Spikelets linear beardless many flowered, Leaves linear, Root fibrous
1103 Pan. sprdg. one-sided, Spikel, about 6-fl. Florets blunt beardless, Leaves lin. conv. glauc. Stem round erect
1104 Panicle spike-shaped, Spikelets slender 11-flowered bearded, Sheaths rough
1105 Culm ascending angular, Leaves rolled together smooth, Pan, nodding close, Spikelets 9-10-flow. pilose 1106 Pan. erect contracted, Spikelets 4-5-fl. very smooth, Paleæ margined membranous, Leaves setaceous
1107 Pan, one-sided oblong, Spikel. 7-fl. bearded, Outer glume and paleæ fringed, Leaves setac. Root fibrous
1108 Panicle one-sided erect branching, Florets ternate oblong angular beardless, Leaves linear striated
1109 Pan. spreading much branched, Spikelets ovate lanc. somewhat bearded 4-5-fl. Leaves linear lanceolate
1110 Pan. close, Branches simple scattered, Spikelets linear 5 -fl. Flowers acum, 2-androus, Stem very rough 1111 Raceme spiked elongated, Spikelets remote beardless afterwards spreading, Root fibrous
1112 Panicle simple erect, Spikelets very few about 7-flowered, Florets acute distant
1113 Panicle fascicled, Spikelets subsessile villous, Beard erect
1114 Panicle one-sided spike-shaped, Spikelets 5-fl. smooth somewhat bearded, Leaves glaucous rigid subulate
1115 Culm ascending, Leaves subconvolute, Spike racemose, One glume very small, Outer paler fringed
1116 Panicle one-sided erect nodding at the end, Spikelets 5-flowered obtuse beardless
1117 Panicle locse spreading nodding, Radical leaves very slender and long, Root creeping

and Miscellaneous Parbiculars.
F. duriuscula, is a good grass either for hay or permanent pasture : hares are remarkably fond of it : its produce in the spring is not very great, but the quality is fine, and the quantity is considerable at the time of flowering. $F$. calamaria is subject to the disease in the grain called clavus, in which the seed swells to three times the usual size, and the kernel is wanting.
F. pratensis is one of the six grasses (Anthoxanthum odoratum, Alopecurus pratensis, Poa pratensis and trivialis, Cynosurus cristatus, and the F. pratensis) which Curtis recommends Lefore all others for laying down meadows or pastures, on soil either moist or moderately dry. According to the Woburn experiments, the value of this grass cut at the time the seed is ripe, is to that of the grass cut at the time of flowering as 6 to 18 ; one proof, among many others, of the advantage of cutting almost all grasses when in fiower rather than later. W. Salisbury says, "if land intended for meadow could be laid down with one bushel of $F$. pratensis, one of Alopecurus pratensis, three pounds of Anthoxanthum, a little Bromus mollis, with white clover, the farmer will seek no farther. ${ }^{\text {* }}$
F. elatior differs little from F. pratensis, but in being larger in every respect. According to the Woburn experiments (xl.) "the produce is nearly that of the former, and the nutritive powers superior in the proportion of 8 to 6 ."
F. loliacea greatly resembles the rye-grass in habit and place of growth: " it has excellencies which make it greatly superior to that grass, for the purposes either of hay or of permanent pasture. It improves in proportion to its age, which is directly the reverse of rye-grass." (Wob, exp. xxxiii.)
F. glauca, cut at the time of flowering, exceeds in value the same grass cut when the seeds are ripe in the proportion of 6 to 12, a strong proof of the value of the leaves and culm in grasses intended for the scythe, and the loss, as we have before observed, of leaving them for the sake of the seed when they become dry and wiry. After this grass, and indeed most others, are in flower, "the root leaves neither increase in number nor in size; but a total suspension of increase appears in every part of the plant, the roots and seed-vessels excepted," (Wob exper. xii.)

1123 Panicle in seed nodding at end, Spikelets ovate oblong compressed naked, Florets at last distinct, Beard wavy shorter than glume, Leaves nearly smooth
1124 Pan. nodding at end, Spikelets lanc. compr, naked, Beard straight longer than glume, Leaves villous 1125 Pan. erect contr. Spikelets oblong ovate roundish pubes. Outer paleæ bifid, Beard straight, Leaves soft 1126 Pan. nearly erect, Spikelet lanc. somew. compr. Flor. closely imbr. smooth, Beard straight afterwards sprdg. 1127 Pan. lax nodd. at end, Spikel. lanc. somewhat compr. Florets closely imbr. Beard at length very much sprdg. 1128 Panicle close erect, Spikelets oblong pubescent 12-15-flow. nearly sessile, Beards below spirally twisted 1129 Pan. nodd. Spikclets lanc, slender, Florets bearded hairy, Beards straight, Leaves smooth, Sheaths hairy 1130 Pan. erect, Spikes lin. slenderish naked, Florets imbr, nearly beardless, Leaves smoothish, Root creeping 1131 Pan. nodd. one-sided, Spikel. lin. lanc. compr. pubesc. Beard straight shorter than glume, Leaves vill. rough 1132 Panicle spreading branching, Spikelets ovate turgid 10 -flowered, Florets elliptical S-nerved on each side
1133 Pan. spreading nodding at end, Spikelets rough lin. Janc. Beard straight longer than glume, Leaves pubesc.
1134 Pan. at length nodding, Spikelets lanc. compr. naked, Beards straight as long as glume, Leaves villous 1135 Pan. erect, Spikel. lin. lanc. compr. Florets imbr. Beard shorter than glume, Leaves tufted very narrow cil. 1136 Pan. nodding at end, Spikelets compressed and leaves pubescent, Beard straight about length of glume 1137 Pan. nodd. Spikelets oblong 6-fl, pubesc. Outer glume with a short beard, Leaves sheaths and stem smooth 1138 Pan. erect, Spik. obl. ov. compr. nak. Flor. imbr. Outer pal. undiv. Beard straight as long as glume, Lvs. pub. 1139 Leaves villous, Panicle spreading erect, Beards long straight, Rachis pubescent
1140 Pan. erect, Spikel, rough lin. lanc. Flor. diandr. Beards straight about length of glume, Lvs. nearly smooth 1141 Pan. nodd. at end one-sided, Spikel. lanc. compr, naked, Florets imbr. Beard flexuose longer than glume

1142 Panicle loose capillary pendulous, Spikelets 6-fl. compr. Outer palea with a short beard villous at edge 1143 Raceme spiked distich. simple somew. nodd, Spikel. rem, erect, Upper beards longer than glume, Root fibr.

1144 Spike sim. ästich. erect, Spikel, altern. pub. bearded, Beard shorter than its valve, Lvs. pub. Root creeping
1145 Spikes in pairs terminal oblong, Florets lanceolate distichous bearded, Culm 2-knotted smooth equal
1146 Spikelets many-flowered 5-9-flowered beardless, Glumes and paleæ obtuse, Leaves setaceous
1147 Glume many-f. Spike simple compressed, Spikelets ovate unilateral, Glumes 3-nerved, Florets beardless
1148 Spike distichous compressed, Spikelets lanceolate oblong sessile
1149 Stem branching creeping rough, Leaves convol. obtuse rigid smooth, Alternate spikel. bearded smooth 1150 Glumes one-sided alternate beardless

1151 Panicle lax, Spikelets ovate with long stalks, Glumes 3-valved, Florets 1-androus, Keel pubescent 1152 Panicle long, Spikelets subsessile, Glume many-valved, Florets 3-androus, Keel smooth, Leaves convol. 1153 Nearly spiked, Leaves involute rigid
1154 Raceme spiked branching erect, Spikelets 5 - 9 -flowered beardless smooth, Leaves involute subulate
1155 Panicle large, Stem firm, Spikelets lanceolate 6-8-flowered, Leaves and stem smooth
1156 Panicle erect contracted oblong, Branches chiefly simple numerous setaceous, Spikelets appressed oblong slender 8-10-flowered, Leaves very long smooth

and Miscellaneous Particulars.
wthers by the hairyness of its stalks. It is found in copsewood in clayey moist soils. Bromus giganteus partly resembles it
185. Brachypodium. From $\beta_{\rho \alpha} \alpha \nu 5$, short, and zrs, a foot, in allusion to the short stalks of the spikelets. An artificial genus, made up of various species of Bromus, Festuca, and Triticum of former writers.
186. Uniola. Named by Linnæus, on account of the union of the glumes. A fine N. American genus, resembling a gigantic Bromus or Festuca. It is chiefly found upon the sands of the sea-coast.
187. Tricuspis. A word signifying three points, in allusion to the structure of its flower. This grass is called Red-top in the southern stãtes of N. America. Pursh says, "a most excellent grass. I have scen mountain meadows in Pennsylvania where they mow this grass twice a-year, producing most excellent crops cach time without manure or any other trouble than the mowing, lasting for the space of sixteen years without the least decline in the crops, the soil at the same time being a very indifferent one."
188. Diplachne, $\Delta \leqslant \pi \lambda$, divided, $\alpha \chi v n$, chaff. The outer palea is divided at the end, and bearded between the divisions.

History，Use，Propagation，Culture，
189．Ceratoc＇loa．The seed having three little horns，the name has been contrived in reference to that cir－ cumstance ：zeges，a horn，and x ion，grass．

190．Schismus．From $\sigma \chi \sigma \mu \sim$ ，a cleft．The outer palea is emarginate or cleft．
191．Triodia．T $\xi^{\xi 6}$ ，three，odous，teeth，on account of the three teeth of the palea．
192．Bechmannia．In honor of M．Beckmann，the celebrated author of the History of Inventions，and of a Lexicon Botanicum，published in 1801，besides other works．

193．Melica．A name applied in Italy to the Holcus sorghum，$L$ ，the pith of which is like mel，honey． M．ciliata and nutans are curious grasses，deserving a place in botanic parterres．
194．Molinin．In honor of Giovanni Ignatio Molina，who wrote an account of the plants of Chili，published in 1782．Of M．cærulea，the fishermen of the isle of Sky make ropes for their nets，which they find will bear the water well without rotting．None of the species are cultivated．

195．Briza．From $\beta_{\varrho} r \rightarrow \omega$ ，to balance，the spikelets being continually in a state of balance or suspension in the air．This is an ornamental or curious genus，of little value in agriculture，The perennial species indicate a poor soil，and are bitter in taste．B．maxima is sometimes sown as a border annual．

196．Poa．Hon is the Greek name of herb．This genus affords several valuable pasture，and some good hay grasses．P．aquatica is one of the tallest of British grasses，with a powerful creeping root，a native of most parts of Europe，and very common in the fens of Cambridgeshire and Lincolnshire，where it not only affords rich pasturage in summer，but forms the chief winter＇s fodder．It is sometimes cut thrice in one season．It grows not only in very moist ground，but in deep water；and with cat＇s tail，burr－reed，\＆c．soon fills up ditches，and occasions them to require frequent cleansing．In this respect it is a formidable plant even in slow rivers．In the isle of Ety they cleanse these by an instrument called a bear，which is an iron roller with a number of pieces of iron like small spades fixed in it；this is drawn up and down the river by horses walking along the bank，

1157 Panicle nodding spreading, Spikelets compressed 6-8-flowered, Sheaths of leaves bearded at end
1158 Panicle contracted, Spikelets linear, Glume longer than florets, Leaves bearded at base
1159 Panicle nearly simple contracted few fiowered, Syikelets oblong ovate 3-4-flow. Glume as long as florets

## 1160 The only species

1161 Outer paleæ of lower floret fringed, Panicle subspicate equal, Spikelets erect at length spreading
1162 Branches of panicle erect or spreading, Spikelets 3-flowered, Outer glume of lower floret hairy at edge
1163 Ligula nearly none, Panicle almost simple, Spikelets nodding beardless, Glumes obtuse
1164 Paleæ beardless, Panicle branching one-sided, Spikelets ovate erect 2-tlowered one imperfect
1165 Ligula half-linear, Panicle branching, Spikelets nodding smooth, Glumes acute
1166 Panicle lax few-flowered, Branchlets simple, Flowers obtuse naked, Stem erect smooth
1167 Paleæ smooth, Panicle spiked branching, Spikelets 3-flowered third flower imperfect
1168 A small purplish grass common on moors with a very narrow smooth spikelike panicle

1169 Panicle erect, Spikelet 3-angular 5-7-flowered, Glume larger than florets
1170 Spikelets ovate, Glume equal to forets, Upper leaf involute
1171 Panicle erect, Spikelets finally cordate, about 7-flowered, Glume less than florets
1179 Panicle nodding at end, Spikelets oblong cordate 13-17-flowered
1173 Pan. equal erect diffuse much branched, Spikel. lin. 5-9-fl. Florets obtuse smooth 7-nerved, Root creeping
1174 Panicle diffuse, Spikelets ovate 5 -f. Ligule of the stem-leaves lanceolate acute, of the rest obtuse
1175 Panicle zigzag, Spikelets 3-flowered, Glumes ovate villous at base, Ligules lanceolate
1176 Panicle contracted erect or nodding, Leaves and stems lax, Ligule oblong
1177 Panicle diffuse, Spikelets ovate 5-flowered, Glumes lanceolate rather silky loose, Ligules very short
1178 Panicle equal diffuse, Spikelets ovate 2-4-flowered at length viviparous
1179 Pan. equal diffuse, Spik. obl. ov. about 3-fl. Flor. vill. at base 5-nerved, Stem and sheaths roughish, Lig, obl.
1180 Panicle diffuse, Root creeping, Upper leaves much shorter than their sheaths, Ligule short truncated
$\beta$ Panicle divaricating, Radical leaves very narrow and long
1181 Panicle diffuse, Spikelets ovate about 3-flowered, Glumes acute villous at base, Ligule very short obtuse
1182 Panicle one-sided divaricating, Spikelets oblong ovate 5-7-flowered, Stem subcompressed
1183 Panicle spreading, Spikelets ovate compressed acute, Outer paleæ pubescent at back
1184 Panicle equal diffuse, Spikel. ovate lanc. 3-f. Flor. few, Sheaths loose 2-edged, Ligule short, Root creep.
1185 Panicle diffuse nodding, Spikelets oblong 5-7-fl, Florets villous at base, Ligule short
1186 Panicle diffuse, Spikelets ovate oblong shining
1187 Panicle equal uiffuse narrowed one-sided spreading when in seed, Root nodose
1188 Pani. equal sprdg. Spikel. lanc. 9-fl. Flor, vill. at base obtuse 5 -nerved, Lvs, rough, Ligule obl. Root creep.
1189 Pan. equal capill. lax erect sprdg. Spikel. 4-5-fl. smooth lin. lanc. Lvs. smooth convol. at end, Stem procumb.
1190 Panicle lax much spreading capillary, Leaves hairy, Stem much branching
1191 Panicle contracted, Spikelets 7-9-fl. cordate lanceolate shining, Glumes green lax

and Miscellaneous $P_{\text {strticulars. }}$
and tears up the plants by the roots, which float, and are carried down the stream. (Curtis.) W. Salisbury says, "it is highly ornamental, and might be introduced into ponds for the same purposes as Arundo phragmites, or planted with Festuca elatior, Poa sudetica, and Phalaris arundinacea in pits and water-holding excavations, where it would be useful as fodder, and form excellent shelter for game." (Bot. Comp. ii. 11.)
$\mathbf{P}$. alpina, in common with many alpine grasses which live almost constantly in a moist vapour, is frequently viviparous. Linnæus says, it is the rudiment of the germen which grows and forms the young plant; Sir J. E. Smith, that the glumes change into leaves, and at length the fructification into a bud.
P. trivialis Curtis considers one of our best meadow and pasture grasses, especially for moist soils and sheltered situations; on dry exposed situations it is not productive, and, as Sinclair observes, dies off in the space of four or five years. Contrary to what is the case in almost all other grasses, the hay of this species is of most value cut when the seed is ripe. It and P. annua are almost the only grasses that will thrive in grass plats in towns and small confined situations.
P. angustifolia is a valuable grass for permanent pasture, being of rapid and early growth; but the stalks and leaves being subject to the rust, it is obviously unfit for hay. P. pratensis assumes a beautiful verdure very early in spring; but as it sends up flower-stalks only once in a season, it is less adapted for hay than for early and permanent pasture. Cultivated by itself, it becomes so much matted by its creeping roots as to be unproductive, unless on water meadows, for which it is one of the best of grasses. $P$. annua is a diminutive plant, the most common in all temperate climates, and perhaps in the world. P. sudetica is a tall aquatic. P. glauca is ornamental from its glaucous hue. P. maritima Sir H. Davy found to be one of the best grasses for producing latter-math. P. fertilis (P. serotina) ranks as one of the most valuable of grasses. According to the Woburn experiments it produces the greatest abundance of early foliage next to $P$. angustifolia. It prefers a clayey soil, and flowers late.

History，Use，Propagation，Culture，
P．abyssinica is grown as a bread－corn in Abyssinia，and furnishes the teff bread；that made from wheat being used only by the superior ranks．The dough is allowed to turn sour，and by generating carbonic acid gas， answers instead of yeast；it is then baked into circular cakes，which are white，spongy，of a hot disagreeable sourish taste，but light of digestion．The same bread，well toasted，and infused in water for some days，fur－ nishes the bouza or common beer of the country，like the quas（sour，Rus．）of Russia．
197．Eragrostis．An elegant appellation derived from sjos and areosss，Love－grass．The pretty dancing spikets are the delight of children，and remembered by men long after many of their other innocent pleasures 198．Megastachya．From charm．The plants resemble the Briza or quaking－grass．
198．Megastachya．From $\mu s y a s$ ，large，and $5 \propto \chi \nu 5$ ，a spike，on account of the large panicles of the genus．
199．Sclerochloat．Hard－grass（ $\sigma x \lambda$ neos，rigid，and $\chi^{\lambda, n}$, grass）．A genus of hard worthless grasses．
to Thunberg，is cultivated in Japan for its edible seeds．

1192 Pan. attenuated, Branches very short, Spikel. 3-fl. acute smooth, Leaves short, of the stem distich. sprog.
1193 Pan. simple contracted linear lanceolate, Spikelets 4-5-fl. Lower glume shortest, Paleæ eroded at end
1194 Lvs. flat striat, rough, Lig, short, Branches of pan. quite sim. Spik. obl. with distant flor. Pal, acute smooth
1195 Pan. branching contr. Spikelets about 5 -flow. Spikel, obtuse slenderish obsoletely 5 -nerved, Root creeping
1196 Pan. one-sided diffuse, Spikel, obl. ovate 5-7-fl. Florets villous at base, Stem oblique compr. Root creeping
1197 Pan. attenuate erect, Spikelets ovate 3-flowered, Paleæ retuse villous at base, Stipule very short
1198 Ligules nearly none, Leaves plaited at base broader and longer than sheath, Panicle elong. Paleæ nerved 1199 Panicle contracted one-sided, Stem round
1200 Panicle equal diffuse, Spikelets ovate 4-5-fl. Florets villous at base, Stem and bundles of leaves bulbous
1201 Pan. equal at length divar. Branches in seed bent down, Spikel. linear about 5 -fl. Florets smooth obtuse
1202 Same as Poa distans
1203 Pan, equal diffuse, Spikel. lin. 9-15-f. Florets smooth, Ligule trunc. ciliated, Stem much branched ascend. 1204 Pan. spiked, Spikel. 5-f. ovate, Flor. smooth acute, Inner palex cil. at back, Stem procumb. and lvs. hairy 1205 Pan. equal diffuse, Spikelets ovate 5-fl. Florets smooth 7-nerved obtuse, Stem furr. ang. Root somew. creep. 1206 Spikes fingered numerous, Spikelets imbricated 7 -flow. Outer glume obtuse 3-nerved rather silky at base

1207 Pan. equal, in f. contr. in seed diffuse, Low. bran. at base and rami. hairy, Sp. lin. 7-9-f. Flor. sharpish smth. 1208 Panicle oblong capillary whorled, Florets 6-flowered very minute nodding
1209 Panicle erect, Flower-stalks stiff, Leaves smooth about the mouth of the sheaths
1210 Panicle equal spreading, Lower branches at base and ramifications hairy, Spikelets 15 -25-flowered 1211 Panicle spreading, Spikelets 18 -flowered linear
1212 Pan. distichous one-sided contr. hard, Spikelets linear acute 5-11-fi. Florets smooth obsoletely 5-nerved
1213 Pan, elong. Branc. sprdg. distant abbrev. Spik. lin. 7-11-fl. close press. Flor, smooth acute 3-nerv. Lvs. glauc. 1214 Panicle closely spiked, Spikelets ovate oblong 6-10-flowered, Florets smooth acute, Inner paleæ fringed

1215 Panicle divaricating, Flower-stalks thickened, Spikelets 4-flowered, Leaves filiform
1216 Panicle lanceolate contracted one-sided rough, Rachis round, Florets obtuse nerved
1217 Panicle one-sided broad contracted stiff, Spikelets lanceolate obtuse 3-5-flowered
1218 Spikes about 7 digitate at length incurv. Rachis membranac. Stem compr. erect, Leaves close together 1219 Spikes digitate erect $5-9$ on a linear rachis, Stem compressed declining branching at bottom

1220 Spikes fingered $4-5$ obtuse much spreading mucronate, Stem ascending, Leaves opposite
1221 Panicle with simple branches, Flowers sessile 6-flowered, the last sterile, lower bearded
1222 Spike alternate very slender, Spikel. distich. beardless, Leaves rather hairy, Sheaths compressed smooth
1223 Pan. branched fringed, Branches simple, Spikelets 5-fl. subsess. Florets all bearded (Rhabdochloa. P.)
1224 Panicle much branched contracted, Branches simple filiform, Spikelets alternate 2-4-flowered beardless

1225 Stolones creeping, Glume much spreading rough, Leaves fringed at edge
1226 All over hoary, Spikes digitate 4, Glume erect, Leaves naked rough at edge
1227 Spikes altern. 1-sided panicled, Glumes equal, Spik. 2-ff. Flor. stalked beardl. herm. Stems prost, Lvs. flat 1228 Spike one-sided simple, Spikelets many-flowered

## 1229 The only species

1230 Spike paral. compr. bearded, Glumes gibbous bearded trunc. at base contr. with a nerve runn, thinner upw. 1231 Spike par, compr. nearly beardl. Glumes gibb. trunc. mucron. at base contr. with a nerve runn. thinner upw.

and Miscellaneous Particulars.
201. Dactyloctenium. The spikes are digitate, or disposed like one's fingers ( $\delta \alpha z \tau \cup \lambda о$, a finger).
202. Leptochloa. From $\lambda \varepsilon \pi \tau \circ 5$, slender, and $\chi^{\lambda .0 \eta, ~ g r a s s, ~ o n ~ a c c o u n t ~ o f ~ i t s ~ h e a d s . ~}$
203. Cynodon. Kvay, xuvos, a dog, and odss, a tooth; wherefore we know not. Cynodon linearis, the Agrostis linearis of König., is the famous durva grass of the Hindoos, for which, see Lambert in the Linn. trans. vii. No. 22.
204, Dinebra. Its Arabic name.
205. Echinaria; Éxivas, a hedge-hog: the prickly round heads may be fancied to resemble little hedgehogs.
206. Triticum. According to Varro, was so named from its grain being originally worn down (tritum) in making it eatable. This is by far the most important genus of the Gramineæ, as including the wheats, the flour of which is universally allowed to make the best bread in the world. For what is man upon rice or potatoes?

History, Use, Propagation, Culture,
T. æstivum, and the five following sorts, are most probably variations of the same species. It is certain that winter-wheat sown in spring will ripen the following summer, though the produce of succeeding generations of spring-sown wheat is found to ripen better. White, red, awned, and beardless wheat change and run into each other on different soils and in different climates; and even the Egyptian wheat is known to change in this country to the single-spiked common plant. There is a sort of summer-wheat apparently a distinct species from those which have been mentioned; the agricultural treatment of which, as well as the general appearance, is similar to that of barley. The straw is short and soft, the ears awned, small, and easily threshed, and the grain may be sown in May and reaped in August or September. It is very subject to the black disease, and though it has been tried in a number of places has never come into general cultivation. A variety from India, called "r hill-wheat," and another from the Cape of Good Hope, have also been tried with no better results. But the hill-wheat, and, we believe, the hill-barley, also, of the northern provinces of India has been cultivated with success in Germany, under the direction of the Archduke John of Austria. T. monococcum grown in Switzerland, is of similar appearance.
T. spelta appears a distinct species, and more hardy than common wheat; it has a stout straw almost solid, with strong spikes and chaff adhering firmly to the grain. The grain is light, yields but little flour, and make. 3 but indifferent bread. It is grown in Switzerland in elevated situations, where common wheat would not ripen : also in Bavaria and other parts of Germany. It is sown in spring, and ripens in July and August.

Of the common wheat there are many varieties, but the most permanent are the red and white grained, and the spring-wheat, which is generally red. The Hertfordshire reds and whites, woolly eared, awned, and nearly fifty other names are merely sub-varieties of the red and white. Wheat answers best when treated as a biennial, though it does not remain above one year in the ground. Provided the soil be well prepared and dry, and the grain sown in time, the plants do not suffer from the greatest cold of our climate, or even that of Russia. In the latter country, and in the northern counties of Britain, the fields are covered with snow, which retaining a temperature of from 30 to 32 degrees, the plants are found to vegetate and establish their roots firmly in the soil. The snow is not thawed off till the weather is decidedly warm in spring, when the plants make rapid progress, apparently more so than in warmer climates. Wheat, like all culmiferous plants, may be said to have two distinct sets of roots; the seminal or tap-root, and the coronal or surface-root, the former proceeding from the embryo, and the latter from the first joint of the stem. The former seem intended to nourish the plant while young, to fix it to the soil, and to penetrate into the sub-soil for water; the latter to search along the surface among the lighter materials of the soil for nutritive particles. There is in the Banksian museum, a stalk of wheat of ordinary length with a tap-root six feet long, which had penetrated into a subsoil of limestone brush, and was taken up in digging a drain. It grew on the estate of J. Fane, Fsq. at Wormley in Oxfordshire, in 1818. M. Sageret, a scientific French agriculturist, found that when wheat or any of the other grains were etiolated immediately after germination, by growing too rapidly or being sown too thick, the first joint from which the coronal or surface roots proceed is raised above the ground, and in consequence either throws out no roots at all, or so few as to nourish it imperfectly, in which cases it either dics before it comes into flower, or before the grains are matured. This accurate statement of what takes place, is well calculated to show the bad effects of sowing winter-wheats too early, or spring-corn too late, and grasses in general too thick. Animal substances, and especially bones and urine, are the best manures for wheat, as containing much gluten, a substance found in a greater proportion in that grain than any other. Next to animal manures lime is important, as tending to the same effect by chemical combinations. Wheat is almost every where cultivated, both in the temperate and torrid zone, to the 45 th degree of north latitude, and the height of 2000 feet above the level of the sea in southern latitudes.

The insects and diseases which attack wheat are various. The grubs of chaffers and beetles, as well as the wire-worm (the larva of different species of Tipula), attack the roots; the wheat-fly (Tipula eritici) the ears; the smut or black the grains; and the mildew, rust, or blight, different names for the same disease, the whole plant. The mildew Sir J. Banks determined to be produced by the growth of a minute fungus on the straws and chaff of the plant, and Dr. Cartwright (Phil. Mag. Oct. 1820.) ascertained it might be destroyed by watering with salt and water. The smut converts the farinaceous part of the grain into a black powder, and is supposed to be prevented or lessened by stecping the grain previously to sowmg in any strong saline mixture. It

1232 Spike compound at the base, Spikelets 3-flowered ventricose imbricated, Terminal floret beardless neuter 1233 Spikelets 4-flowered ventricose pubescent imbricated bearded, Terminal fioret barren, Glumes obtuse 1234 Spikelets 4-flowered ventricose roughish, Two middle florets sterile, Paleæ unequal outer fringed 1235 Spikelets 3-flowered ventricose roughish, Intermediate floret barren, Glumes ovate
1286 Spikel. 2-f.ventr. imbr. bearded, Barren floret with a short, fertile with a very long beard, Glumes 3-toothed 1237 Spike distich. Spikelets 4 -flowered approxim. Two middle florets sterile, Glumes lin. lanc. Stem ascending 1238 Glumes 9 -nerved obtuse $4-5$-flowered, Florets beardless, Rachis smooth, Root creeping
1239 Root creeping white jointed proliferous
1240 Glumes shortly bearded 3-nerved 5-flowered, Florets bearded, Root fibrous
1241 Spike interrupted, Rachis hispid, Leaves rolled in at edge, Root creeping
1242 Glumes 4-flowered bearded, Spikes lanceolate imbricated, Stems pubescent
1243 Spikelets 4-flowered remote, Two joints of the hairy rachis longer than the spikelet
1244 Spikelets 3-flowered, Ribs of glumes fringed in tufts, Leaves downy
1245 Spikelets lanceolate 8-flowered beardless, Glumes truncate naked, Leaves nerved
1246 Spike beardless, Spikelets longer than glume
1247 Culm slender, Leaves narrow, Spikelets 3-4-flowered
1248 Spike bearded, Spikelets less than glume, Culm rough upwards
1249 Spike nearly beardless, Spikelets as long as calyx

and Miscellaneous Particulars.
is not easy, however, to cure diseases in the vegetable kingdom, and therefore the grand objects of the cultivator ought to be to procure healthy seed, and apply judicious culture.
The uses of wheat are well known. The grain yields a greater proportion of flour than every other ; for, while 14 lbs . of barley yield 12 lbs , of flour, and of oats 8 lbs ., the same quantity of wheat yields 13 lbs . It is also more nutritive, 1000 parts of barley yielding 920 , of oats 743 , and wheat 955 soluble parts. Of these, the gluten of wheat is 90 , of barley 60, and of oats 87. (Davy. Ag. Chem. 188.) Gluten is so essential an ingredient in bread that the pannary fermentation cannot go on without it, and hence the inferiority of that article in wet seasons, when wheat is blighted or ill ripened, and the advantage of having a stock of old grain, or of grain from the south of Europe, especially of the Mediterranean isles and coasts.

Wheat starch is made from wheat, by steeping it, and afterwards beating it in hempen bags, The mucilage being thus mixed with the water produces the acetous fermentation, and the weak acid thus formed, renders the mucilage white. After settling, the precipitate is repeatedly washed, and then put in square cakes. In drying, the cakes separate into flakes as found in the shops. Starch is soluble in hot water, but not in cold; and hence, ground down, it makes an excellent hair powder. Its constituents are carbon 43.55 ; oxygen 49.68 ; hydrogen $6.77=100$.

The straw of wheat, from dry chalky lands, is manufactured into hats, for which purpose the middle part of the tube above the last joint is taken, and being cut into lengths of 8 or 10 inches, these pieces being split are used to form the plait. The operation of plaiting is performed by females and children, who plait it into ribbons of from one to two inches broad, and these are afterwards sown together on blocks or moulds, beginning at the crown, in various shapes according to fancy or fashion. The best straw is produced on the chalky soil about Dunstable, where plaiting is a common occupation. Other grasses afford culms which have also been used and manufactured into much finer and expensive work that those of wheat or rye. Leghorn hats are made from the straw of a bearded variety of wheat not unlike rye. It is grown on poor sandy soils on the banks of the Arno, between Leghorn and Florence, expressly for this manufacture. It does not grow above 18 inches in length, is pulled green, and bleached like flax on the gravelly bed of the river. The straws are not split as in England, which renders the plait tougher and more durable. The value of wheat-straw for thatching, litter, and other purposes, need not be mentioned.
T. junceum grows in loose sand on the sea-coast, and by its tough creeping roots and numerous fibres cooperates with Carex arenaria, Elymus arenarius, and Festuca rubra, in keeping them stationary, accumulating more, and eventually rendering drifting sands fit for agricultural purposes.
T. repens, couch, white couch, twitch, dog-grass, quickens, \&c. is common in most parts of Europe, and even in Siberia. It is one of the worst weeds in arable lands and gardens, and in the former is only to be destroyed by fallowing or fallow crops, or laying down to grass; and the latter by hand-pickirg or very deep trenching. The roots are sweet and nourishing, and axe greedily eaten by horses and cattle. Sir H. Davy found thent to contain nearly three times the nourishment of the stalks and leaves.
207. Lolium. Loloa is the Celtic name of this grass. L. perenne is the fuusse ivraie (see L. temulentum) of the French, from which our term ray-grass is derived, the Dauerende Lolch, Ger., and Loglio vivace, Ital This appears to be the first grass which was taken into cultivation in Europe, but when is uncertain. Gerarde, Parkinson, Plattes, and even Blythe in Cromwell's time, take no notice of it. It is first mentioned by Dr. Plott in 1677. "They have lately sown," he says "ray-grass, Gramen loliaceum, to improve cold sour clayey weeping ground unfit for saint-foin." It was first sown in the Chiltern parts of Oxfordshire, and afterwards by one Eustace at Islip in the same county. There are two varieties of this grass; the perennial, which is of shorter growth than the other, and on sound dry soils will last four or five years, and on rich soils longer; and the annual, or rather biennial, which is tall and larger in all its parts than the perennial, and after producing one bulky crop dies at the root, or, at least, sends up no latter math. After all that has been aftirmed of other grasses, none appear so well adapted as the annual rye-grass for producing a bulky crop of hay, with or without red clover; or better adapted than the perennial variety for sowing down with white clover, to afford three or more years pasture in the rotations of what is called convertible husbandry, or the alternate corn and grass cuiture. Cock's-foot grass and woolly grass (Holcus) may afford a greater bulk on poor soils, but are far inferior to the ray-grass in regard to nutritive qualities. Sir H. Davy found the value which

History, U'se, Propagation, Culture,
this grass cut at the time it is coming into flower bears to that when the seed is ripe, to be as 10 to 11. Pacey's perennial ray-grass, a variety raised in Staffordshire, has long been in repute, and there has lately been a new variety raised in Bedfordshire, known as the Russel ray-grass.
208. Elymus. Linnæus derives the name from $\varepsilon_{i \lambda \varepsilon \omega}$, to cover, because the leaves of his Elymus maritimus are formed into a coarse sort of fabric. The Elymus of the ancients was evidently a sort of corn. E. arenarius is a strong rough glaucous plant common on sandy shores, and like Calamagrostis arenaria and others, which have been mentioned (genus Lygeum, Stipa, Arundo), prevents, by its matted roots, the shifting of loose sand thrown up by the tides. In analyzing the soluble matter afforded by this grass, Sir H. Davy found it to contain more than one-third of its weight of sugar. It is not, however, eaten by any of our domestic animals.
209. Secale. An ancient name, supposed to have been derived from seco, to cut, which word is said to have been formed from the Celtic sega, a sickle. This grain, of which there is probably only one species, affords a grain next in value to the wheat for making bread, and is generally used for this purpose, alone or mixed with wheat, throughout Germany and the north of Europe. It is hardier and earlier than wheat. Like it, it will ripen if sown in spring, but better if treated like a winter-wheat. In Britain it is little sown. Its grain yields $792-1000$ parts of soluble matter, of which 645 are mucilage, 190 gluten, and 38 sugar.
210. Hordeum. Bodæus a Stapel derives this word from hordus, heavy, because bread made with barley is very heavy. Bara is the Celtic for bread, whence the English words barn and barley; as beer is a slight alteration of the appellation of barley in that tongue, Bere. Hexastichon ( $i \xi$, six, $\sigma r i \xi \sigma \pi / x \neq 5$, row) signifies grain growing in six rows; distichon, in two rows. Zeocriton is derived from $\zeta_{\varepsilon \infty}$, which is supposed to have been Spelt, and xes.9n, barley : that is to say, barley resembling spelt wheat. The four first species, or, more probably, sub-species, are cultivated as barleys. H.vulgare or two rowed barley, is that in gencral cultivation, and of this the rath-ripe and Thanet are preferred as varieties. H. hexastichon is the bear or bigg chiefly cultivated in the north of Scotland, and in Denmark and Sweden. H. distichon has thin husks, and is preferred for malting. H. zeocriton or sprat barley has short broad ears, long awns, and short coarse straw, and is not much cultivated. The native country of barley is unknown. It was cultivated by the Romans as a horse-corn, and also for the army, and the gladiators were called Hordiarii from their feeding on this grain. In the south of Europe they have sometimes two crops in one season; one sown in autumn and cut in May, and another

1279 Spike subulate somewhat compressed erect, Leaves channelled
1280 Spike subulate erect, Leaves flat
1281 Spike subulate erect, Glume minute, Florets bearded
1282 Spike subulate erect, Glume ensiform acuminate appressed

sown in spring and in autumn. In I apland two months and in
sown in spring and cut in autumn. In Lapland two months, and in England nine weeks elapse between the sowing and cutting of this grain.
Malt is the chief purpose for which barley is cultivated in Britain, but it is also made into flour, and pot and pearl barley. In order to understand the process of malting, it may be necessary to observe, that the cotyledons of a seed before a young plant is produced, are changed by the heat and moisture of the earth into sugar and mucilage. Malting is only an artificial mode of effecting this object, by steeping the grain in water, and fermenting it in heaps, and then arresting its progress towards forming a plant by kiln drying, in order to take advantage of the sugar in distillation for spirit, or fermentation for beer. The chemical constituents of mucilage and sugar are very nearly alike: in the process of malting a part of the mucilage or starch is converted into sugar, so that the total quantity of sugar, and consequently the source of spirit, is increased.

Of pot-barley there are two sorts, pearl and Scotch, both produced by grinding off the husk, and the former variety by carrying the operation so far as to produce roundness in the kernel. It is used in soups, gruels, and medicinal drinks.
Barley-flour is ground like flour, and forms a light pudding or pottage, which, spread out in thin cakes and slightly toasted, forms a breakfast bread much esteemed in some parts of Scotland. It is brought to table hot from the baking plate, and eaten with butter and honey, or cream and sugar.
H. murinum, squirrel-tail-grass, is common by way-sides, and its awns or heads are so injurious to the gums of horses in the isle of Thanet, that one of the greatest recommendations of an inn is having "6 hay without any mixture of squirrel-grass."
H. pratense resembles rye, and to this, Professor Martyn observes, the name of rye-grass belongs, and not to Lolium perenne, which is ray (from ivraye, Fr.) grass.
211. Microchloa. From usxos, small, x $\quad$ don, grass, on account of its size.
212. Ophiurus. A name constructed by Gartner from bips, a snake, and sea, a tail, from a fancied resemblance in the spikes of the genus to the tail of a viper. This is the genus Rottböllia of English botanists : but no true species of that genus have yet been cultivated in this country.
213. Monerma. From $\mu$ ovos, one, and equљ, support; there is only one glume, which by its rigidity acts as a support to the flower.

214. Pcrotis. From тugos, deficient, some parts of the flower being absent.
215. Saccharum. From its Arabic name soukar, from which the Greeks formed $\sigma \propto \chi \chi \propto \rho$, and modern European nations sugar. Sucre, Fr. Sucker, Ger., \&c. This grass or reed, though unknown to the ancients, has hecome of immense importance in modern times. There are many varieties or species both wild and cultivated, natives of the banks of rivers and meadows in both the Indies, China, Africa, the South Sea islands, and South America. It is cultivated in a zone extending from 35 to 40 degrees on each side of the equator. Where it was first cultivated is unknown; in all probability, in India, for the Venetians imported it from thence by the Red Sea prior to 1148. It is supposed to have been introduced into the islands of Sicily, Crete, Rhodes, and Cyprus by the Saracens, as abundance of sugar was made in these islands previously to the discovery of the West Indies in 1492 by the Spaniards, and the East Indies and Brazil by the Portuguese in 1497 and 1500. It was cultivated afterwards in Spain, in Valentia, Granada, and Murcia by the Moors, and sugar is still made in these provinces. (Townsend and Jacob.) In the 15 th century the cane was introduced to the Canary islands by the Spaniards, and to Madeira by the Portuguese, and thence to the West India islands and the Brazils. The Dutch began to make sugar in the island of St. Thomas, under the line, in 1610, and the English in Barbadoes in 1643, and in Jamaica in 1644. The culture of the cane has since become general in warm climates, and the use of sugar being universal, it forms one of the first articles of commerce throughout the world. Sugar is described by Pliny and Galen as a sweet salt, and from the former it appears to have been used only in medicine. Actuarius, a physician, who wrote in the 10 th century, or later, was the first to substitute sugar for honey in medicinal compositions. It was called Indian salt, and a small piece was recommended to be kept in the mouth to moisten it in fevers. Different medical men have written for and against the use of sugar, as they have against tea, coffee, wine, and all with similar success. The enjoyment derived from these articles to all mankind who enjoy them, is too great to be left off in deference to the opinions of a few. Dr. Mosely is the greatest advocate for sugar. For the last two centuries it has been an ingredient in the popular diet of Europe. It was in use in England in 1466 , but chiefly in feasts and as a medicine, till it was brought from the Brazils about 1580 to Portugal, and imported from thence. The quantity consumed in Britain has always kept mereasing; the consumption of England alone in 1790 amounted to $166,573,344 \mathrm{lbs}$; which, taking the population at eight millions, gives each individual at an average about 20 lbs . a-yeas.

The cane, as a stove plant, is of easy culture in soft moist soil with a good heat; it grows seven or eight feet high, but it never flowers. It was grown in abundance in the stoves of the Paris gardens, and a small sugar loaf was made from the canes, and presented to the Empress Josephine. In the botanic gardens of Toulon and Naples it stands the winter in the open air.

The cane in the West Indies is propagated by cuttings from the root end, planted in hills or trenches in spring or autumn, something in the manner of hops. The cuttings root at the joints under ground, and from those above send up shoots, which in eight, twelve, or fourteen months are from six to ten feet long, and fit to cut down for the mill. A plantation lasts from six to ten years. Sugar mills are merely iron rollers placed vertically or horizontally, between which the canes are passed and repassed. The juice thus squeezed out, is collected and boiled with quick-lime, which being an alkali, imbibes the superfluous acid, which would otherwise impede crystallization: impurities are skimmed off, and the boiling is continued till a thick syrup is pro.

1283 Culm simple, Leaves very smooth, Joints smooth
1284 Flowers panicled, Leaves flat
1285 Pan. spiked cylindrical, Leaves convolute, Joints smooth, Flowers generally diandrous

and Miscellaneous Particulars.
duced, when the whole is cooled and granulated in shallow vessels. It is now the raw or Muscovado sugar of commerce. A further purification is effected by dissolving it in water, boiling, skimining, adding lime, and clarifying from the oily or mucilaginous parts, by adding blood or eggs, which incorporate with them and form a scum. When boiled to a proper consistency it is put into unglazed earthen vessels of a conical shape, with a hole at the apex, but placed in an inverted position, and the base, after the sugar is poured in, covered with clay. When thus drained of its impurities, it is taken out of the mould, wrapped in paper, and dried or baked in a close oven. It is now the loaf sugar of the shops, and according to the number of operations it undergoes, is called single or double refined. The operation of refining is seldom or never performed by the growers; but in Europe, at least, generally forms a separate branch in the mother country of the colony.

Sugar candy, Shukur and khand, Indian names for sugar in general, is formed by dissolving loaf sugar in water over a fire, boiling it to a syrup, and then exvosing it to crystallize in a cool place. This is the only sugar esteemed in the east.

Barley sugar is a syrup from the refuse of sugar candy, hardened in cylindrical moulds.
Rum is distilled from the fermented juice of sugar and water.
Sugar as a chemical compound is described as a neutral salt, consisting of the acetic acid, united to a small quantity of oil and charcoal, carbonated hydrogen, and carbonic acid gas. Besides its use in medicine, dietetics, and distillation, it is employed to preserve animal and vegetable substances from putrefaction, and to communicate a gloss to ink, varnishes, and pigments. When very cheap, it has been successfully employed to fatten caitle. Most plants contain sugar, and it has been extracted in considexable quantities from the beet, parsnip, maple, birch, grape, \&c., but the cane is preferred as affording it in greater abundance.
216. Imperata. The derivation or application of the idea not explained. The plants resemble in their noble port and waving silky heads the plumes of a cap of state.
217. Leersia. Named after J. D. Leers, an author of the Flora Herbornensis, the first edition of which, in 1789 , is very valuable on account of its rarity: but its merits have been extolled much beyond reality by Sir James Smith. One species, L. lenticularis, which has not yet been introduced to this country, has the power of catching fies by the singular structure of its corolla, which resembles the leaves of Dionæa muscipula.

219. Arundinaria. An alteration of the word Arundo, to which genus this may be compared with reference to its large size.
220. Holosteum. A name derived from $\dot{\text { dios, all, and orrsov, bone, all-bone, and applied by antiphrasis to }}$ this plant, which is no-bone, being very soft and delicate. The plant is very common in many parts of Britain, by road sides, where protected by hedges; it flowers early in the season, and keeps flowering for a long time. In coppice woods on loamy soils it grows with the greatest luxuriance, and, along with the yellow primrose, and the purple wild hyacinth, forms a most ornamental clothing to the earth in the end of April and beginning of May.
221. Polycarpon. From aodus, many, zegжos, fruit; all-seed; one of the names applied by the ancients to the Polygonum aviculare, and sufficiently applicable to this plant.
232. Lechea. In memory of $G$. Lechen, a Swede, professor of natural history at Abo, and author of observations on rare plants; died in 1764 . The genus consists of small N. American plants of no beruty.

History, Use, Propagation, Culture,
223. Eriocaulon. Eptov, wool, and zav kind, E. septangulare, has been found in Britain. The species are all very curious, and deserving of more attention than they have received at the hands of cultivators.
224. Montia. In honor of Joseph de Monti, professor of botany and natural history at Bologna in the beginning of the 18th century. The plants are small inconspicuous weeds.
225. Mollugo. The Roman name of what is supposed to be our Galium mollugo, which the present plant resembles in its whorled leaves and inconspicuous appearance.

## Class IV. - Tetrandria. 4 Stamens.

This class is neither so large nor so important as the last. It is composed chiefly of ornamental or curious plants, mostly shrubs, of which the Proteacea hold the first rank. Among the few plants used in the arts which it contains, may be raentioned the madder (Rubia), Fuller's thistle (Dipsacus), the holly (Ilex), one of the best evergreen hedge plants; and some foreign timbers and dyes, as the sandal-wood and chayroot.
The Proteacex, of which the first section of the class partly consists, are natives chiefly of the Cape of Good Hope and New South Wales; and there is this singular circumstance connected with their geographical distribution, that those two continents do not possess any one genus in common; a singular fact, and of the more difficult solution, as the genera of the order are strictly natural. They have been described by Mr. Brown, in a long and learned memoir, in the Transactions of the Linnean Society, vol. $x$. , where much information respecting them may be found. It has been impossible to state the natural height or color of flower of many of the New Holland kinds, as Mr. Brown says nothing upon these two points; and he is the only author who has seen the plants in their native country, where alone many of them have flowered. In the conservatory they are mostly shrubs of from four to seven feet in height.
The principal part of the fourth section of Monogynia consists of the Stellate or Crossworts, which are common weeds all over Europe.
Many of the genera in the sixth section, such as Ixora, Pavetta, Catesbæa, are beautiful ormaments of the conservatory, The wood of Curtisia in the seventh section furnishes the Caffres with materials for the shafts of their hassagays.
With the exception of Proteaceæ, the class is made up of a miscellaneous assemblage of species, with few characters in common. The genera have not been combined in any other than a purely artificial manner, and among them are to be found plants belonging to almost all the natural orders of Dicotyledonous plants of the older French botanists. Pothos, Potamogeton, and Ruppia are among the rare instances of a quaternary division of the flower in Monocotyledonous plants.

Order 1. MONOGYN1A.
 4 Stamens. 1 Style.

## 1. Flowers incomplete, (no corolla), inferior.

229. Petrophila. Cal. 4-cleft, all deciduous. Style persistent at base. Stigma spindle-shaped, narrowed at end. Scales beneath the ovary none. Cone ovate. Nut lenticular, comose at one end.

1295 Stera 7-angled, Leaves acuminate cellular, Male f. monopetalous tetrandrous
1296 Stom 7-angled, Leaves flat hairy much shorter than the stem, Scales of the head powdery
1297 Stem erect divaricating, Leaves connate-sessile oblong ovate
1298 Stem weak dichotomous, Leaves opp. sessile obtuse lanceolate fleshy
1299 Leaves whorled wedge-shaped acute, Stem divided decumbent, Pedunc. 1-flowered 1300 Stem erect, Leaves whorled three larger than the rest, Pan. terminal and lateral

1301 Leaves filiform dilated at base, Branches terminal capitate corymbose, Flowers axillary
1502 Leaves capillary, Flowers terminal stalked alternate longer than bractex
1303 Leaves capillary, Corymbs leafy axillary stalked, Flowers shorter than bracteæ

## 1304 Leaves opposite filiform, Flowers terminal heaped, Bracteæ squarrose

1305 The only species

226. Minuartia. In memory of John Minuart, a Spanish botanist, and correspondent of Linnæus. He published some Opuscula in 1739.
227. Querza. In memory of Joseph Quer, a Spanish botanist, who published a Flor Espagnol in 1762, in six volumes, quarto.
228. Kœnigia. In honor of Emanuel Kœenig, professor of botany at Bale, and called the modern Avicenna; he died in 1731. He published several works now forgotten. The plant is a curious inconspicuous annual, occasionally seen in botanic gardens.
230. Isopogon. Cal. 4-cleft, with a slender tube, persistent for a long time. Style wholly deciduous. Stigma spindle-shaped or cylindrical. Scales beneath the ovary none. Nut sessile, ventricose, comose on all sides.
231. Protea. Cal bipartible, unequal, with the stamen-bearing divisions of the broader lip cohering. Style subulate. Stigma narrowly cylindrical. Nut bearded on all sides, with the remains of the persistent style. Common receptacle with short persistent scales. Involucrum imbricated, persistent.
232. Leucospermum. Cal, irregular, labiate, with three of the segments (rarely all) cohering at the base, the stamen-bearing divisions distinct. Style filiform, deciduous. Stigma thickened, smooth, sometimes unequal-sided. Nut ventricose, sessile, smooth. Head indetinitely many-flowered. Involucrum many-leaved, imbricated.
233. Mimetes. Cal. 4-parted, equal, with distinct divisions. Style filiform, deciduous. Stigma cylindrical, slender. Nut ventricose, sessile, smooth. Common receptacle flat, with narrow deciduous scales. Involucrum indefinitely many-leaved, imbricated.
234. Serruria. Cal. 4-cleft, nearly equal, with distinct claws. Stigma vertical, smooth. Scales 4, hypogynous. Nut shortly stalked, ventricose. Head indefinitely many-flowered, with persistent imbricated scales.
235. Nivenia. Cal. 4-cleft, equal, wholly deciduous. Stigma clavate, vertical, Nut ventricose, shining, sessile, entire at the base. Involucrum 4-leaved in a simple series, 4-flowered, when in fruit indurated. Receptacle flat, without scales,
236. Sorocephalus. Cal. 4-cleft, equal, wholly deciduous, Stigma vertical, clavate. Nut ventricose on a very short stalk, or emarginate at base. Involucrum 3-6-leaved in a simple series, definitely few-flowered or 1-flowered, in fruit not altered. Recept. without scales.
257. Spatalla. Cal. 4-cleft, wholly deciduous, the inner segment usually largest. Stigma oblique, dilated. Nut ventricose on a short stalk. Involucrum 2-4-leaved in a simple serics, 1-flowered, or definitely many flowered. Recept. without scales.
238. Persoonia. Cal. 4-leaved, regular, the segments having the stamens in their middle, recurved at end, and deciduous. Stamens exserted. Glands 4, hypogynous. Ovary stalked, 1-celled, 1-2-seeded. Stigma vbtuse. Drupe berried, with a 1-2-celled nut.
239. Grevillea. Cal. irregular, with the segments 1-sided, bearing the stamens in their hollow ends. Anthers immersed. Gland 1, hypogynous, halved. Ovary 2seeded. Stigma oblique, depressed (sometimes nearly vertical and conical). Follicle 1-celled, 2 seeded, with a cell in the middle. Seeds edged, or with a very short wing at the end.
240. Hakea. Cal. 4-leaved, irregular, with the segments on one side. Stamens immersed in the concave ends of the calyx. Gland 1, hypogynous, halved. Ovary stalked, 2-seeded. Stigma nearly oblique, with a conical point from a ditated base. Follicle 1-celled, woody, with a cell out of the centre, falsely 2 valved. Seed with a wing at the end longer than the nut.
241. Stenocarpus. Cal. irregular, segments distinct, at one side. Stamens immersed in the concave ends of the cal. Gland 1, hypogyoous, half-annular. Ovary stalked, many-seeded. Style deciduous. Stigma oblique, orbicular, flattened. Follicle linear. Seeds winged at base.
242. Lambertia. Cal. tukular, 4-cleft, the segments spirally revolute. Stamens inserted in the segments.

Scales 4, hypogynous, distinct or united in a sheath. Ovary 2-seeded. Stigma subulate. Follicle 1-celled, coriaceous. Seeds emarginate. Involucrum 1-7-flowered, imbricatod, deciduous. Receptacle flat, without chaff.
243. Xylomelum. Cal. 4-leaved, regular, the segments revolute at the end. Stam. inserted above the middle of the segments. Glands 4 , hypogynous. Ovary 2-seeded. Style deciduous. Stigma vertical, clavate, obtuse. Follicle thick, woody, 1-celled: the cell out of the centre. Seeds winged at end,
244. Telopea. Cal. irregular, on one side irregularly divided, on the other 4-toothed. Stam. immersed in the concave ends of the calyx. Gland none. Ovary stalked, many-seeded. Stigma oblique, orbicular, dilated. Follicle cylindrical. Seeds winged at end. Involucrum none.
245. Lomatia. Calyx irregular, with distinct 1-sided segments. Stamens immersed in the concave ends of the calyx. Glands 3, hypogynous on one side. Ovary stalked, many-seeded. Style persistent. Stigma oblique, dilated, roundish, flat. Follicle oval. Seeds winged at ends.
246. Rhopala. Cal. 4-leaved, regular, segments recurved at end. Stamens inserted above the middle of the segments. Scales 4, hypogynous, distinct or connate. Ovary 2 -seeded. Style persistent. Stigma vertical, clavate. Follicle 1-celled, woody. Seeds winged at both ends.
247. Banksia. Cal. 4-parted. Stamens immersed in the concave ends of the segments. Scales 4, hypogy nous. Ovary 2 -celled, with 1 -sceded cells. Follicle 2 celled, woody. Dissepiment loose, bifid.
248. Dryandra. Cal. 4-parted or 4-cleft. Stamens immersed in the concave ends of the segments. Scales 4, hypogynous. Ovary 2-celled, with 1-seeded cells. Follicle 2-celled, woody, with a loose bifid dissepiment. Common receptacle flat.
249. Struthiola. Cal. tubular, having 8 glands at the mouth. Berry without juice, 1 -seeded.
250. Opercularia. Common calyx 1-leaved, campanulate, 3-6-flowered, 6-9-toothed, proper none. Seeds solitary, immersed in a closing receptacle, which is operculiform, deciduous.
251. Cryptospermum. Common calyx 6-leaved: leaflets spreading, unequal ; proper, 3-leaved from the chaff of the receptacle. Recept. globose, chaffy. Capsules 1 -celled, united into a sub-globose receptacle, opening lengthwise in the middle,
252. Pothos. Spathe 1-leaved. Spadix cylindrical, simple, covered with flowers. Cal. 4-leaved. Stamens next the ovary. Berry 2 -seeded.
253. Rivina. Cal, 4-leaved, persistent. Berry 1-seeded, with a lentiform rough seed.
254. Camphorosma. Calyx urceolate, with two opposite and alternate teeth very small. Caps. 1-seeded. Stamens exserted.
255. Alchemilla. Cal. 8-cleft, the alternate segments smallest. Style from the base of the ovary. Seed 1, naked, covered with the calyx.
256. Sanguisorba. Cal. coloured, 4-lobed, with 2 scales at the base. Caps. 4-cornered, enclosed in the calyx, 1-2-celled.
257. Dorstenia. Common receptacle 1-leaved, fleshy, dilated, spreading, orbicular, or angular, in which the solitary seeds nestle.

## 2. Flowers incomplete, superior.

258. Isnarda. Cal, campanulate, adhering to the ovary, 4-cleft. Caps. 4-celled, surrounded by the calyx, 4-cornered, many-seeded.
259. Elcagnus. Cal. 4-8-cleft, campanulate on the outside rugose, inside colored, deciduous. Filaments very short between the segments of the calyx. Style short. Drupe ovate, with an oblong 1-seeded nut.

## 3. Flowers monopetalous, 1-seeded or dicoccous, inferior.

260. Globularia. Common calyx imbricated : proper tubular, 5-toothed. Cor. with the upper lip 2, the lower 3-parted. Seed 1, enclosed in the calyx. Recept. chaffy.
261. Houstonia. Cal. 5-toothed Cor. tubular. Caps. 2-celled, 2-valved, 2seeded.

## 4. Flowers monopetalous, 1-seeded or dicoccous, superior.

DIPSACEA.
262. Dipsacus. Common calyx many-leaved, proper superior. Cor, tubular, 4-cleft. Seed 1, crowned by the calyx. Recept. conical, chaffy. Pappus cross-shaped, entire.
263. Cephalaria. Common calyx sub-globose, with scales more or less scarious, proper double, pappus shaped, variously split. Receptacle chaffy.
264. Scabiosa. Common calyx many-leaved, proper double pappus-shaped, variously split. Receptacle chaffy.
265. Knautia. Common cal, many-leaved, cylindrical, oblong, simple, 5-flowered, proper simple, superior Corolla irregular. Seed 1, crowned by the calyx. Receptacle naked.

## stellate

266. Galium. Cal, an obsolete superior edge. Cor. rotate. Seeds 2, globose.
267. Rubia. Cal, an obsolete superior edge. Cor. rotate, sub-campanulate. Berries 2, 1-seeded. Stam. 4-5. 268. Aspcrula. Cal an obsolete edge, 4-toothed. Cor. monopetalous, funnel-form. Seeds 2, globose, not crowned by the calyx.
268. Sherardia. Cal. a 4-toothed edge. Cor. monopetalous, funnel-form. Seeds 2, 3-toothed, crowned by the persistent calyx.
269. Spermacoce, Cal. a 4-toothed edge. Cor. monopetalous, funnel-form. Caps. 2celled, not divisible in two, with 2 cells, 2-toothed. Seeds with their edge rolled together over their side.
270. Crucianclla. Cal. 2-3-leaved. Cor, monopetalous, funnel-form, with a filiform tube and an unguiculate limb. Sceds 2, linear.

## 5. Flowers monopetalous, many-secded, inferior.

272. Callicarpa. Calyx 4-toothed. Corolla tubular, campanulate, 4-cleft. Stamens exserted. Berry 4-seeded.
273. Witheringia. Cor. sub-campanulate, with a tube having 4 projections. Cal. very small, obsoletely 4-toothed. Pericarp 2-celled, berried. Anthers conniving, opening laterally.
274. Egiphila. Cal. 4-toothed. Cor. 4-cleft. Style semi-bifid, filiform. Berry 2-celled. Cells 2-seeded,
275. Cephalanthus. Common cal, none; proper, as well as corolla, 4-toothed, rubular funnel-form. Receptacle globose. Caps. 2-4-celled, not splitting. Seeds solitary by abortion, oblong.
276. Scoparia. Cal. 4-parted, equal. Cor. 4-parted, rotate, with a hairy throat, regular. Stamens equal. Stigma obtuse. Capsule nearly round, 2-celled, 2-valved, with a dissepiment from the inflexed margins of the valves.
277. Centunculus, Cal, 4-cleft. Cor, 4-cleft, tubular, with a spreading limb. Stamens short. Caps, 2-celled, cut round, many-seeded.
278. Plantago. Cal. 4-cleft. Cor, quadrifid, with a refiexed limb. Stamens very long. Caps. 2-celled, cut round.
279. Buddlea. Calyx and corolla 4-cleft. Stamens from the incisures. Caps. 2-furrowed, 2-celled, manyseeded.
280. Exacum. Cal. 4-leaved. Cor. somewhat bell-shaped, 4-cleft, with a globose tube. Caps, compressed, 2 -furrowed, 2celled, many-seeded, splitting at the end.
281. Sebcea. Cal, 4-5-parted, the sepals keeled or winged. Cor, 4-5-cleft, withering. Stamens exserted,
the anthers bursting lengthwise after flowering with a recurved callus at the end. Stigmas 2. Caps, with the valves inflexed at the edge, inserted in a central placenta, which finally becomes loose.
282. Frazera. Cal. deeply 4-parted, spreading. Cor. much larger than the calyx, very deeply 4-parted, spreading, the segments oval, bearded with a gland in the middle. Stamens shorter than corolla, with anthers $\frac{1}{2}$-divided at the base. Stigmas 2, thick, glandular. Caps. oval, much compressed, 1 -celled,2-valved at the edge. Seeds $8-12$, elliptical, with a membranous edge.
283. Penaa. Cal. 2-leaved deciduous. Cor. campanulate. Style quadrangular. Stigma 4-lobed. Caps. 4-cornered, 4-valved, 8 -seeded.
284. Blaria. Calyx 4-parted. Corolla 4-cleft, somewhat campanulate. Seeds inserted into a receptacle. Caps. 4-celled, many-seeded, opening at the angles.

## 6. Flowers monopetalous, 2 or many-seeded, superior.

285. Chomelia. Cal. 4-parted, tubular, with unequal segments. Cor. hypocrateriform, 4-parted. Drupe oval, inferior, with a 2celled, 2-seeded nut. Stigmas 2, thickish.
286. Adina. Cal. 4-5-cleft, with an occasional toothlet between the divisions. Corolla infundibular. Filaments inserted into the mouth of corolla. Stigma turbinate. Seeds $2-3$ in each cell. Flowers in heads.
287. Bouvardia. Cal. 4-leaved, with some teeth between. Corolla tubular. Anthers included. Caps. 2-partible, many-seeded. Seeds edged.
288. Ixora. Cal. 4-parted. Cor, monopetalous, funnel-shaped, long. Stamens above the throat. Berry 4-seeded.
289. Catesbaca. Cal. 4-toothed, very small. Cor, funnel-shaped, very long. Stamens within the throat Stigma simple. Berry 2-celled, many-seeded.
290. Pavetta. Cal. 4-toothed. Cor. monopetalous, funnel-form. Stigma thickened, incurved. Berry 1-2-seeded, 1 -celled.
291. Ernodea. Cal. 4-parted. Cor. hypocrateriform. Style simple. Berry 2-celled. Seeds 2, solitary.
292. Siderodendrum. Cal. small, 4-toothed. Cor, hypocrateriform, 4-cleft, with an incurved tube. Stigmas 2, revolute. Berry 2-coccous, 2-celled, dry, with a contrary dissepiment. Seeds 2, solitary.
293. Coccocypsilum. Cal. 4-parted. Cor. funnel-shaped. Berry intlated, 2-celled, many-seeded. Style half 2 -cleft.
294. Mitchella. CaI. 2, on one ovary, 4-parted. Cor. funnel-shaped, hairy within. Stigmas 4. Berry bifid, 4-seeded.
295. Oldeniandia. Cal. 5-toothed, persistent. Cor, of 5 petals inserted into the calyx.
296. Manettia. Cal. 8-leaved. Cor. quadrifid, tubular. Caps, 2-valved, 1-celled. Seeds imbricated, orbiculate, with a central point.

## 7. Flowers polypetalous, inferior:

297. Epimedium. Cal. 4-leaved, caducous, opposite the petals. Nectaries t, cup-shaped, incumbent upon $^{\text {, }}$, the petals. Pod 1 -celled, 2 valved, many-seeded.
298. Ptelea. Cal. 4-parted. Pet. coriaceous. Stigmas 2. Samara roundish with a 1-seeded centre, or 2-celled, 2-seeded.
299. Monetic. Cal. 4-cleft, urceolate. Pet. 4, revolute, linear. Berry 2celled, with 2-seeded cells, one of which is usually abortive.
300. Curtisia. Cal. 4-parted. Petals 4, obtuse. Drupe roundish succulent. Nut 4-5-celled.
301. Hartogia. Cal. 4-5-cleft. Petals 4, spreading. Drupe not juicy, ovate. Nut rather fleshy, 2-seeded.
302. Ammannia. Cal. 1-leaved, campanulate, plaited, 8-toothed. Pet. 4, inserted in the calyx, or very often none. Caps. 2-4-celled, many-seeded.
303. Fagaia. Cal. 4-5-cleft. Corolla of $4-5$ petals, which are shorter than the stamens. Cal. 2valved,
$1-2$-celled, 1 -seeded, simple or compound. Stam. 4-5-8.
304. Zieria. Cal. 4-cleft. Cor. of 4 petals. Stam. 4, smooth, with filaments inserted into a gland. Style simple. Stigma 4-lobed. Caps. 4, connivent. Seeds with an arillus.

## 8. Flowers polypetalous, superior.

305. Cissus. Cal. 1-leaved, nearly entire. Berry 1-seeded, rarely 3 -4-seeded, surrounded by the calyx.
306. Cornus. Involucre 4-leaved in some. Cal. 4-toothed. Pet. 4. Drupe with a 2-celled nut.
307. Santalum. Cal. $\frac{1}{2}$-superior, campanulate, 4-cleft. Pet. 4, squamiform. Berry 1 -seeded. Embryo inverse, albuminous
308. Trapa. Cal. 4-parted. Nut with 2 opposite spines proceeding from the leaves of the calyx, 1-celled, 1 -seeded.
309. Ludvigia. Cal. 4-parted, superior, with long persistent sepals. Cor. 4-petals or O. Caps. 4-cornered, 4-celled, crowned, inferior, many-seeded.

Order 2. DIGYNIA. $\qquad$
310. Cuscuta. Cor. 4-fid, ovate, Cal. 4-fid. Caps. 2-celled, cut round.
311. Bufonia. Cal. 4-leaved. Pet. 4, shorter than calyx. Caps. 1-celled, 2-valved, 2-seeded.
312. Hamamelis. Involucr. 3-leaved. Sepals 4. Petals 4, linear, very long. Nut 2-horned, 2-celled.
313. Hypecoum. Cal. 2-4-leaved. Pet, 4, the two exterior widest. Fruit a silique.

Orḍer 3. TETRAGYNIA.
4 Stamens. 4 Styles.
314. Myginda. Cal. 4-toothed, very small, persistent. Pet. 4, rounder, flat, spreading, Stamens shorter than corolla. Style short. Stigmas 2-4. Drupe globose, 1-celled, with a 1-seeded nut.
315. Hex. Cal. 4-5-toothed. Cal. rotate, 4-cleft. Style O. Berry 4 -seeded.
316. Coldenia. Cor. 1-petalous. Cal. 4-leaved. Seeds 2, 2-celled.
317. Potamogeton. Sepals 4. Pet. O. Style O. Seeds 4, sessile.
318. Ruppia. Cal. and Cor. O. Seeds 4-stalked.
319. Sagina. Sepals 4. Pet. 4. Caps. 4-celled, 4-valved, many-seeded.
320. Tillea. Cal. 3-5-parted. Pet. 3-5, equal. Caps. $3-5,2$ or many-seeded, opening inwards Nectary none.
321. Radiola. Cal. many-cut. Pet, 4. Caps, superior, 4-8-valved, 8-celled, globose. Seeds solitary.

## MONOGYNIA.

IIstory, Use, Propagation, Culture,
229. Petrophila. From $\pi \varepsilon \tau \rho \circ s$ and $\$ i \lambda \varepsilon \omega$, to love rocks, in allusion to the places in which it is found growing in a wild state. Stiff shrubs, with smooth leaves of various kinds. Heads of flowers ovate or oblong, terminal or axillary. Ripened cuttings root in sand under a hand-glass.
230. Isopogon. This genus consists of stiff shrubs, with smooth, flat or filiform, divided or entire leaves. Heads terminal or rarely axillary. Flowers sometimes closely imbricated in a globose cone, sometimes clustered in a common flat receptacle which is somewhat involucrated; they thrive best in a soil composed of onethird loam, a third of peat, and a third of sand. The pots must be well drained, and ripened wood may be chosen for cuttings which will root in sand and a little earth under a hand-glass. They must be uncovered frequently, and the glass wiped, as they are liable to damp off if kept too close. (Sweet.)
231. Protea. A mythological name of Proteus the son of Ocean and Thetis, who assumed various forms upon various occasions, to whom this genus, once equally variable in its forms, has been likened. It, as Sweet observes, thrives best in a soil composed of " light turfy loam, mixed with rather more than one-third of fine sand; the pots must be well drained with broken potsherds to prevent them from getting soddened with too much water; the roots are also very fond of running amongst the small bits of sherds. Care must be taken not

## MONOGYNIA.

1306 Leaves trifid bipinnate, Segments erect, Flowers silky their segments tomentose at end 1307 Leaves bi-tri-pinnatifid plain, Segments mucronate, Flowers bearded, Cones axillary stalked

## 1308 Leaves pinnatifid and bipinnatifid filiform furrowed above, Segments erect, Branches smooth

1309 Leaves bipinnatifid somewhat triternate filif. chan. above, Segments divaricating, Branchlets tomentose
1310 Leaves trifid pinnatifid or bipinnatifid, Leaves linear flat spreading erect smooth beneath
1311 Leaves wedge-shaped flat 3-lobed attenuated at base stalked lobes entire, Branchlets tomentose
1312 Leaves elongate oblong mucronate attenuate at base, Branches and involucres smooth

## Flowers terminal.

1313 Leaves roundish stalked, Invol. silky, Inner bractes acute beardless, Style pubescent below the middle 1314 Leaves broad ovate $\frac{1}{2}$ cordate sessile, Invol. silky toment. Inner bractes narr. dilated at end and bearded 1315 Leaves ovate oblong cordate edged the callus of the end prominent, Invol. silky fringed beardless
1316 Leaves ov. obl. sessile subcord. or simple, Branches toment. Invol. silky, Inner bracte elong. fringed silky 1317 Leaves ov. obl. narr. at base with branches smooth, All the bracteæ sim. inn. dilat. at end and beard. in mid. 1318 Leaves glaucous obov, the adult smooth, Bractes red the upper lyrate spatul. fimbr. obt. Petals obtuse 1319 Leaves narr, oblong veiny oblique simple at base, the edges and branches downy, Involucre ciliated 1320 Leaves linear ligulate edged ciliated, Branches hairy, Invol. long turbinate, Bract. fringed with white 1321 Leaves linear ligulate edged roughish shining with the branches smooth, Inner bract. of invol. spatulate 1322 Leaves linear ligulate smooth opaque at base outside with the branches downy, Invol. fringed with black 1323 Leaves linear ligulate edged shining roughish, Branches little dowry, Invol. fringed with black
1324 Leaves narrow oblong rather wavy attenuated at base, Invol. hemisph. inner bearded with black and purple
1325 Leaves broad long elliptical edged the old ones pubescent wavy, Bractes pale yellow, the upper fringed
1326 Leaves elong. lin. atten at base, Inv. turb. Bractes smooth acute beardl. Beards of cal. longer than segm. 1327 Leaves long ligulate, Head broad convex embossed in middle, Upper bractes spatul. the length of flower 1328 Leaves long ligulate, Head broad not convex, Upper bractes spatulate longer than flowers
1329 Leaves lanc. ligul. attenu. at base, Inv. turb. Bractes smooth beardl. viseid, Beards of fow. woolly white 1330 Leaves obl. sessile and branches smooth, Invol. hemispherical beardl. naked, Fl. toment. Style smooth
1331 Leaves lin. lanceolate acute submucr. attenuated at base, Invol. hemispherical, Bractes smooth obtuse 1332 Leaves lanc, lin. mucr. pungent with an obtuse base, Bractes lanc. mucr. smooth, Stem erect many-flow, 1333 Leaves ligulate oblong the upper and the branches hairy, Inner bracteæ with a round and bearded end 1334 Leaves subulate mucronate, Invol. nodding hemispherical, Bract. smooth obtuse
1335 Leaves linear lanceolate mucronate, Flower-bearing hranches recurved, Bract. obtuse at length smooth 1336 Leaves lin. lanc. flat attenuated at base roughish at edge, Branches decumbent, Invol. hemisph.
1337 Leaves linear veinless smooth concave above, Branches smooth decumbent, Invol. obtuse
1338 Leaves lin. lanc. acute flat veiny above, Bractes obtuse pubesc. and conc. at end, Branches wavy colored
1339 Stems short with depressed branches, Leaves obov. obl. edged veiny attenuat. at base, Invol. hemispher.
$\beta$ Leaves more glaucous and narrow
1340 Stems dwarf decumb. Leaves elong. lin. smooth veinless recurved at edge, Invol. hemispherical
1341 Stems dwarf, Leaves elong. lin. scrabrous obsoletely veiny recurv, at edge, Invol. turbinate hemispher. 1342 Stems decumb. dwarf, Leaves elong. lin. roughish revol at edge, Invol, turb. Bractes obtuse tomentose 1343 Stems dwarf, Leaves elongate lanc. edged subundulate smooth, Invol. turb. Bractes tomentose obtuse 1344 Stems dwarf, Leaves elongate lanc. edged smooth, Invol. turbinate, Bractes lanceolate acuminate

## Flowers lateral.

1345 Leaves cordate roughish nerved, Bractes smooth
1346 Leaves cordate ovate, Stem clasping divaricate recurved at the end, Bractes pubescent
1347 Leaves linear acute, Receptacle conical, Paleæ acute
1348 Leaves subulate, Receptacle convex, Paleæ obtuse
1349 Style longer than the hairy flower, Stigma gibbous on one side, Invol. downy, Leaves linear entire
1350 Style a quarter longer than the hairy flow. Stigma gibb. on one side, Leaves lin. obl. veiny ent. obt. at base 1351 Style nearly twice as long as hairy flow. Stigma gibb. on one side, Leaves lin. obl entire or 2 or 3 -toothed

and Miscellaneous Particulars.
to let them droop for want of water, as the young roots are of a very fleshy substance, and soon suffer by too much drought, as well as by too much wet, so that they seldom recover if suffered to flag much; they also like to be placed where they may have a free circulation of air, as they cannot bear to be crowded like some more rigid-growing plants. Ripened cuttings taken off at a joint, and pared quite smooth, will strike root if planted thinly in pots of sand placed under a hand-glass, but not plunged: the glasses must be often taken off to give them air, as they are very liable to get the damp amongst them, which soon spreads if not cleaned off, and destroys them; water them regularly whenever they want it, but not over the leaves, and let them get a little dry before the glasses are placed over them again. Some of the kinds root very soon, others are a long time before they root. The quickest rooting kinds I have met with are P. cordata, cynaroides, amplexicaulis, grandiflora, acerosa, nana, and acaulis. P. mellifera also roots very quickly sometimes. The same treatment will agree with several other genera belonging to this family, as Leucospermum, Spatalla, Sorocephalus, Leucadendron, and Aulax. (See Bot. Mag. No. 1717. Bot. Cult. 244.) There are several kinds in cultivation, and published in Knight's Proteeæ, which have not been retained here; because, as they are not acknowledged by Mr. R. Brown, it is I robable that they are not distinct from some which are here enumerated."

History，Use，Propagation，Culture，
232．Leucospermum．From $\lambda \in ย z o s$, white，and $\sigma \pi с \rho \mu \propto$, seed，in allusion to the color of the seeds．The genus is chiefly composed of low shrubs，which are usually downy or hairy．Leaves entire，or with callous teeth at the end．Heads terminal．Flowers yellow．The culture as for Protea．

233．Mimetes．Named by Mr．Salisbury from espenrøf，a mimic，because it resembles various other genera， The soil for this genus is two－thirds of light loam，and one third of sand．In other respects，the treatment is the same as for lsopogon．
234．Serruria．Named by Burmannus after Professor Joseph Serrurier，a foreign botanist，of whom little is known．The species flower freely，and make handsome bushy shrubs．The sonl best adapted to them is one－ third light loam，a third of peat，and a third of sand，with well drained pots．＂They also require an airy situ． ation，as they are so crowded with leaves that the branches are liable to damp and canker if any wet settles

1352 Leaves elliptical edged, Bractes spreading: upper spatulate minutely fringed, Petals downy
1353 Style nearly twice as long as hairy flower, Stigma conical ovate gibb. on one side, Leaves obl. 3-4-toothed 1354 Style longer than the very villous flower, Stigma equal-sided conical, Leaves oval 3-9-toothed
1355 Style longer than very vill. fl. Stig. equal-sided obl. Lvs. obl, lanc, 3-toothed and entire, Branches very hairy 1356 Style longer than hairy fl. Stigma equal-sided ovate, Lvs, lanc. and ellipt, entire short pub. Branches hairy 1357 Leaves linear channelled veinless, Branches and bracteæ tomentose, Segments of fower bearded
1358 Leaves linear flat, Branches hairy, Bractex smoothish ciliated
1359 Leaves linear wedge-shaped flat veiny 3-5-toothed, Branches hairy, Bractes and segments of flow. toment.
1360 Leaves linear 3-toothed, Bractes rounded tomentose twice as short as tube of flower
1361 Involucr, equal-sided colored acuminate half exserted 8-10-fowered, Leaves acute entire
1362 Leaves oval lanceolate pubescent, Stigma short prominent at base
1363 Invol, unequal-sided, Leaves lin. oblong 3-toothed smooth the floral dilated beneath with recurved edges 1364 Stem procumbent, Leaves oval obtuse pubescent, Style smooth, Heads terminal
1365 Leaves narrow obovate almost smooth, Upper bractes longer than flowers very acuminate
1366 Stem procumbent, Branches ascending, Leaves linear subulate channelled, Segments of flower smooth

## Heads simple.

1367 Leaves from below the middie bipinnatifid hairy, Head sessile higher than leaves, Bractes hairy outside 1368 Leaves from base bipinnat. hairy, Ped. as long as head or longer, Bractes hairy at end outside, Stig. trunc 1369 Leaves from the base 3-pinnatifid pubescent, Ped. 1-3 long smoothish, Bractes recurved scarcely toment.
1870 Heads terminal and axillary stalked clustered, Leaves pinnatifid and trifid more than an inch long
1371 Heads terminal longer than the stalk, Leaves pinnatifid and trifid less than an inch long, Stem pubesc.
1372 Heads ter. longer than stalk, Lvs, sprdg. upper less an inch long nearly bipin. lower shorter trifid, Stem erect 1373 Heads terminal stalked, Leaves bi-tripinnatifid with the erect stem hairy
1374 Heads term, sessile, Leaves bi-pin. about an inch long upper longer than heads with the branches smooth 1375 Heads ter. longer than stalks, Brac. subul. smooth hairy at edge, Lvs. sub-bipinnate and branches smooth 1376 Heads ter. and axil. stalks branch-like squarrose, Outer bractes subul. inner lanc. Lvs. an inch and half long 1377 Bractes a little shorter than the terminal head, Outer lanc. fringed inner less villous, Leaves bipinnatifid 1378 Stem pubesc. Leaves from below middle all bipinnatifid, Heads $1-3$ shorter than ped. Bracts refiex. ciliat. 1379 Leaves bipinnatifid filiform pointed hairy, Flowers terminal sweet-scented
1380 Leaves from below the middle bipinnatitid pubescent, Heads 1-3 longer than leaves, Bractes silky at base Heads compound.
1381 Stem erect, Lvs. smth. bipin. more than an inch long, Partial heads many-f. outer brac. smth. : inner silky 1382 Stem erect, Branches pub. Lvs. bipin. an inch and more long, Partial heads few-fl. All the bractes very vill. 1383 Stem erect, Leaves triternate bundled less than $\frac{1}{8}$ inch long common and partial heads few-flow. sessile
1384 Heads corymbose 10 -flow. Leaves bipinnatifid setaceous scarcely 2 inches long, Flowers silky clustered 1385 Corymbs compound, Leaves triternate $\frac{1}{6}$ inch long and stem very smooth, Bractes and partial stalks silky 1386 Corymbs simple or compound, Leaves bi-tripinnat. common flower-stalk long, partial and Dractes smooth

1387 Leaves obovate or lanceolate flattish simple at edge, Flower silky with appressed hairs
1388 Leaves broader than long hooded edged, Leaves of invol. obt. Flower bearded style smooth, Stig. clavate 1389 Stalks umbelled $\frac{1}{2}$ as long as the cylindrical spike, Bractes ovate, Style 2-3ds hairy, Leaves smooth
1390 Stalks umbelled about as long as cylind. spikes, Leaves obtuse divar. smooth, Styles vill, as far as middle 1391 Spikes cylindrical 4 times as long as their stalk, Leaves of involucrum ovate acute beardless at end

1392 Involucr. 3-flowered, Segments of flower and points of bracteæ smooth, Spike naked
1393 Leaves spatulate lanceolate smooth beneath, the lower bipinnatifid, Flower bearded, Stigma cylindrical 1394 Involucr. 3-flowered stalked, Segments of flower bearded, Spike naked
1.395 Lvs. filif, less than $\frac{1}{6}$ inch long, Heads few-f. Seg. of fl. feathery except the inner one, Spike with an invol. 1396 Leaves 3-cornered filiform more than $\frac{1}{b}$ an inch long furrowed above, All the segments of flower feathery 1397 Leaves lanceolate scabrous beneath, Claws of flower glandular hairy, Stigma clavate

1398 Involucr. 4-leaved, Leaflets withered at end, Spike conical headed, Flowers sessile
1399 Involucr. 2-leaved the wider leaf trifid, Spike sessile imbricated, Leaves with a sharp point
1400 Spikes racemose stalked, Bractes shorter than the 4-flowered downy involucrum, Leaves incurved 1401 Spike sessile, Bractes and invol. ovate lanc. vill. Leaves longer than flow. acute chann. and branches hairy

and Miscellaneous Particulars.
amongst them. Ripened cuttings taken off at a joint and planted thinly in a pot of sand, will root without difficulty under a hand-glass: but the glass must be taken off occasionally to give them air, and dry their leaves." (Bot. Cult. 254.)
235. Nivenia. Named by Salisbury, in compliment to Mr. James Niven, an intelligent collector, who discovered many new plants in South Africa while in the service of Mr. Hibbert. Culture as for Serruria.
236. Sorocephalus. From $\sigma \omega \varrho \circ 5$, a heap, and $\approx \in \emptyset \propto \lambda \eta$, a head, on account of the heads of flowers being in clusters.
237. Spatalla. A word formed by Mr. Salisbury, with more wit than decency, from orarah $\alpha \omega$, lascivio, on account of its ample stigma. Culture as for Leucospermum.

## History，Use，Propagation，Culture，

238．Persoonia．So named by Sir J．E．Smith，in honor of C．H．Persoon，the celebrated author of Synopsis Plantarum and other eateemed works ：he is still living，and about to publish a new edition of his most useful Synopsis．

239．Grevillea．So named by Mr．R．Brown，after the Right Honorable Charles Francis Greville，a great promoter of natural history．He was one of the vice－presidents of the Royal Society．Some species ripen sand under a hand－glass． sand under a hand－glass．

240．Hakea．Named by Schreber after Baron Hake，a patron of the botanic garden at Hanover．This genus thrives in equal parts of loam，peat，and sand well drained；and cuttings root readily in sand under a hand－glass．

## 1402 Leaves linear hairy scabrous recurved at edge, Flowers axillary, Ovary one-sided silky

1403 Leaves oblong linear mucronate rather villous, Flowers axillary solitary
1404 Leaves lanceolate or elliptical mucronate glabrous smooth, Peduncle axillary 1-flowered, Flower silky
1405 Leaves lanceolate oblong unequal-sided, Flowers smooth, Stem arborescent, Bark scarious in layers
1406 Leaves obovate acute smooth on both sides without ribs thick, Flowers axillary remote on long stalks
1407 Leaves filiform lax, Spike leafy elongated pyramidal, Floral leaves abbreviated
Style smooth, Follicle ribless.
1408 Leaves ellipt. or obl. obt. mucr. broken back at the edges, Flower branches erect, Racemes abbrev. recurv.
1409 Leaves elliptical oblong attenuate at base broken back at edges, Flower bearing branches recurved
1410 Leaves subulate fascicled divaricating broken back at the edge, Branches villous rounded
1411 Leaves linear lanceolate acute mucr, broken back at edges, Rac, abbreviate erect, Style very smooth at end 1412 Lvs. elong. linear broken back at edges smooth, Inner beard of flower very dense, Stalks longer than ovary Style hairy. Follicle ribbed.
1413 Leaves oblong obtuse mucronate, Racemes recurved few-flowered, Pistils tomentose
1414. Leaves lanc, sub-acum. mucr. above dotted scabrous beneath cinereous, Branc. pubes. Rac. few-fl. recurved

1415 Leaves lanceol. hairy beneath, Style very long compressed hairy at back
[or horizontal
1416 Leaves obovate obt. mucr. above scabrous and shining beneath rather silky, Hairs of flowers appressed
1417 Leaves elliptical and obovate mucronate above roughish beneath cinereous Pistil woolly. Follicle ribless.
[as recurved appendage
1418 Leaves elliptical above dotted scabrous beneath cinereous with close tomentum, Stig. orbic. scarcely as long
1419 Leaves elliptic lanceolate little revolute at edge, Flowers scarcely higher than leaves
Raceme thyrsoid. Leaves pinnatifid. (True Grevillec, Br.)
1420 Leaves elongate linear pinnatifid cut or entire beneath tomentose, Racemes 3 times as short as the leaf

## Leaves filiform.

1421 leaves smooth, Flowers silky or hairy, Caps, lanceolate acuminate straight crested on both sides 1422 Leaves smooth with bloom not channelled, Petals woolly
1423 Leaves terete, Branches toment. Gland attached to oblique end of stalk, Flow. silky, Caps. gibbous nodose 1424 Lvs. ben, with an obsol. furr, at base and branc. s.-pub. Branchl. and fl-stks. hairy, Caps. gibb.with cav, inside 1425 Leaves smooth beneath below the middle with an obsolete furrow the length of fruit, Caps. gibbous rugose 1426 Leaves furrowed above pinnatifid occasionally undivided, Flowers racemose smooth, Caps. gibbbous 1427 Lvs, of upper branches filif. of lower flat, Perianths very smooth, Caps, with 2 spurs umbelled much shorter Leaves flat, toothed, or entire.
[than leaf
1428 Leaves narrow-lanceol. prickly toothed minutely dotted a little rough at the edge, Caps. 2-spurred convex 1429 Leaves oval opaque sinuate-toothed prickly stalked, Caps. 2-spurred ovate gibbous compressed at end
1430 Lvs. lanc. or obl. attenu. at base with a few prickly teeth or entire shining veiny with branches very smooth 1431 Lvs. sinu. tooth. shining veiny stem-clasp. with a dilated cord. base, Stem prost. Bran. smooth, Caps. spurl. 1432 Lvs. angul. tooth. dil. at end and cuneate at base cord. stem clasp. Stem prost. Branc. pubes. Caps. spurless 1433 Leaves pinnatifid and bipinnatifid linear, Capsules spurless
1434 Leaves pinnatifid the anterior segments 1 inch long the posterior $1 \frac{1}{4}$ inch and more
1435 Leaves obovate 3-nerved reticulated wavy prickly toothed, Caps, spurless ventricose
1436 Leaves lanc. entire and nerved obsoletely veined prickly at end upper pubesc. Caps, term. 2-spurred gibbous 1437 Lvs, elongate-lanc, entire 1-nerv. acute withered at end with hran, very smooth, Caps, keeled on both sides 1438 Lvs, lin.-lanc. elongate entire 3-nerv. obsoletely veined rough. wither. at end, Bran. downy, Caps. lanceol, 1439 Leaves entire 3-nerved veiny obovate-oblong or linear lanceolate reversed, Branches angular, Bark warted 1440 Leaves entire 5-nerved reticulated elliptical or oval pointless, Stalks and flowers smooth, Bark shining

1441 Leaves elongate lanceolate 3-nerved at base
1442 Involucres 7-flowered, Leaves linear-lanceolate cuspidate
1443 The only species
1444 Leaves wedge-shaped oblong toothed veiny smooth
1445 Leaves bipinnatifid very smooth, Segments wedge-shaped or lanceolate cut 1416 Leaves linear lanceolate elongate smooth remotely serrate

and Miscellaneous Particulars.
241. Stenocarpus. A handsome genus. The name is derived from $\sigma$ reyos, narrow, and zagjos, fruit.
242. Lambertia. In honor of A. B. Lambert, Esq. F. R. S., vice-president of the Linnæan Society, and possessor of a rich Herbarium. This handsome plant thrives well in loam and peat not over watered. Cuttings must be taken off at a joint before they begin to push, and planted thinly in sand under a glass, and guarded from darap.
243. Xylomelum. A name derived by Sir J. E. Smith from the remarkable fruit of the plant which resembles a wooden apple; $\xi u \lambda o y$, wood, and $\mu \tilde{n} \lambda \alpha v$, an apple.
 the plant, and make it a conspicuous object in its own country, as well as in our conservatories.
245. Lomatia. From $\lambda . \omega \mu \boldsymbol{c}$, an edge, on account of the winged edge of the seeds.

G 3

History, Use, Propagation, Culture,
246. Rhopala. The vernacular name of one of the species found in Guiana is Roupala. The species seldom flower, and are remarkable more for the beauty of their foliage than blossoms, which are disposed in long spikes, usually of a greenish color.
247. Banksia. So named by Linnæus, in honor of Sir Joseph Banks, Bart., Pres. R. S., a distinguished promoter of the study of natural history, and of science in general : he died in 1820. This is an elegant genus, and to be grown well requires a soil composed of equal parts of peat, loam, and sand. The pots must be well drained; and the following is the mode recommended by Sweet: "Place a piece of potsherd about half way over the hole at the bottom of the pot, then lay another piece against it that it may be hollow, afterwards put some smaller pieces all round them, and some more, broken very small, on the top of these. All plants belonging to the Proteaceæ should be drained in the same manner, as the roots are very fond of running amongst the them flag for want of water, as they soldoch danger of their being overwatered; care must be taken not to let them flag for want of water, as they seldom recover if allowed to get very dry; they should also be placed in an airy part of the green-house when in doors, as nothing is more beneficial to them than a free circulation of air. Cuttings are generally supposed to be difficult to root, but they will root readily if properly managed : let them be well ripened before they are taken off; then cut them off at a joint, and plant them in pots of sand without shortening any of the leaves, except on the part that is planted in the sand, where they should be taken off quite close; the less depth they are planted in the pots the better, if they only stand firm when the sand is well closed round them; then place them under hand-glasses in the propagating house, but not plunge them in

1447 Leaves alternate ovate lanceolate complicate toothed attenuated at both ends 1448 Leaves 4 together subsessile wedge-shaped oblong entire

1449 Leaves acerose entire not pointed, Claws of flower woolly, Segments smooth, Stigma a depressed head 1450 Leaves acerose entire mucronate, Flower all hairy, Stigma subulate, Cones' globose
1451 Leaves acerose entire mucronate, Flower hoads nodding, Flowers silky
1452 Leaves acerose emarginate 2-toothed entire, Flower heads long, Flowers silky, Stigma capitate
1453 Leaves acerose 3-toothed at end, the middle tooth longest prickly or entire at the edge, Stigma subulate 1454 Leaves linear prickly toothed; the terminal tooth shortest

1490 Leaves lanceolate mucronate ciliate concave incurved at end
1491 Leaves linear ciliated, Bractes longer than germen
1408 Leaves all over hnary

and Miscellaneous Particulars.
heat ; the glasses must be frequently taken off to give them air and dry them, or they are apt to damp off; when they are rooted, the sooner they are potted off in little pots the better, as the sand is liable to canker their roots if left too long in it; when potted off, they should be placed in a close frame, but not on heat, as a bottom heat will destroy their roots, when they must be hardened to the air by degrees. Plants raised in this way have better roots, grow faster, and flower sooner than plants raised from seeds. In raising them from seeds they should be sown in the same kind of soil as the plants are grown in, and placed in the green-house; or if it is in summer they will come up sooner if placed out in the open air; they will soon make their appearance, when they should be potted off in small pots, for if left in the seed-pots too long they are apt to die, and are more difficult to move with safety." (Bot. Cult. 147.)
248. Dryandra. Was named by Mr. R. Brown after the famous Jonas Dryander, whose catalogue of the Banksian library would alone be a monument of talent and industry, if his high botanical acquirements had been unknown. This genus is allied in character and habits to Banksia. It thrives best in very sandy loam and peat in well drained pots. Cuttings made from ripened wood taken off at a joint before they begin to push, planted in sand without shortening any of the leaves, and covered with a glass, wiil root without difficulty. The pots should not be plunged, and as soon as the cuttings are rooted they must be potted off, as the sand is apt to injure their roots. Place them afterwards in a close frame or under hand-glasses till they strike root afresh, and then harden them by degrees. (Sweet.)
249. Struthiola. From $\sigma \pi \rho^{8} \sigma 05$, a sparrow: the pointed seed vessels have some resemblance to the beak of a G 4

History, Use, Propagation, Culture,
sparrow or other small bird. The species are all slender, hardy, green-house plants, of pretty appearance, and easy cultivation.
250. Opercularia. From operculum, a lid, in allusion to the manner in which the calyx is closed. Plants of no beauty.
251. Cryptospermum. From жŋvส $\omega$, to conceal, and $\sigma \pi \varepsilon \rho \mu \infty$, seed. The seeds, or rather seed-vessels, are hidden in the involucrum. Weeds of some tropical countries.
252. Pothos. From potha, the native name of this plant in Ceylon, Most of the species are sub-parasitic, and found climbing, like ivy, on the trunks of trees in the West Indies and America. In our stoves most of the species will thrive planted in old bark and moss, and plunged in heat. P. palmata has leaves upwards of three feet long, with a foot-stalk nearly four feet long, palmate, as thick as strong parchment, smooth, with a midrib of a deep green above, and the fructification on spikes more than a foot in length. The species are cultivated for the sake of their foliage, which is always of an agreeable green color, and not liable to discoloration by damp or other accidents of a hot-house.
253. Rivina. In memory of A. Q. Rivinus, a native of Saxony, born in 1652, and died in 1722. He was for a long time professor of botany and medicine at Leipsig, and left behind him some valuable botanical works; and among them a very ingenious attempt at a classification of plants by the corolla; from which some modern botanists have profited more than they have acknowledged. The name, as Linnæus observes, with his usual neatness, has been given to a shrub always covered with leaves and fruits, in allusion to the merit of the works of Rivinus. R. octandra, the Hoop-withy of Jamaica, and liane a baril of Martinique, has a very long tough flexile stalk an inch or more in diameter, and sometimes made into hoops in the West Indies. The berries con-

## 1493 Leaves opposite ovate rough, Flowers capitate, Heads stalked axillary

## 1494 Stem erect 4-cornered and leaves lanceolate entire smooth

History, Use, Propagation, Culture,
258. Isnarda. Antoine Tristan Danti d'Isnard was a French botanist, professor at the Jardin du Roi, and member of the Academy of Sciences, to which he communicated many memoirs upon plants from 1716 to 1724. An obscure marsh plant.
259. Elceagnus. From Eגase, an olive: the tree having a striking resemblance to the olive tree, E. angustifolia is a low tree with elegant silvery leaves and a brown bark, but not of long duration. All the hardy species are commonly propagated by layers; but according to Sweet and Haynes, "cuttings will strike if taken off at a joint in ripened wood, and planted in a sheltered situation early in autumn." The green-house and stove species strike in sand under a bell-glass.
260. Globularia. From the flowers being packed in globose heads. The species called Alypum has been so named from $\alpha$, privative, and $\lambda \nu \pi \eta$, pain; used by way of antiphrasis, according to Dalechamp, because it is a dangerous purgative. Bauhin even calls it Frutex terribilis; but Clusius says, it was used by the Spanish quacks of his day as a cure for venereal diseases. It is however doubtful whether the Alypon of the old botanists is the same with the plant so called by the moderns. Cuttings of the shrubby green-house species, taken off before they begin to make new shoots, root freely in loam and peat under a bell-glass, and in moderate bottom heat. The hardy and herbaceous kinds may be propagated from seeds, or divided like daisies. Miller says, they prefer a shady situation and a moist loamy soil ; but Sweet recommends a light sandy soil. The leaves of most of the species dry black.
261. Houstonia. Named after Dr. Wm. Houston, the friend and correspondent of Miller : he died in 1733. The plants are small, elegant in their habits, and very fit for pots or rockwork.

1529 Leaves stalked ovate acute
1530 Leaves lanceolate
1531 Leaves oblong acute at each end silvery, Flowers solitary nodding
1532 Leaves oblong ovate opaque
1533 Leaves ovate
1534 Leaves ovate acuminate wavy
1535 Stem shrubby, Leaves lanceolate linear entire, Flowers axillary subsessile solitary
1536 Stem shrubby, Leaves lanceolate 3 -toothed and entire, Heads terminal
1537 Stem herbaceous, Radical leaves about 3-toothed much longer than the stalk, Cauline lanceolate
1538 Radical Ieaves crenate acuminate, Cauline entire mucronate
1539 Radical leaves wedge-shaped retuse toothed at end the intermediate tooth very small
1540 Stem naked, Leaves entire lanceolate
1541 Leaves radical ovate, Stem compound, First peduncles 2-flowered
1542 Leaves ovate lanceolate, Corymbs terminal
1543 Corona obsolete, Head cylindrical, Bractes recurved, Leaves connate entire subcoriaceous
1544 Corona obsolete, Head cylind. Bractes straight, Invol. weak longer than head, Lvs. conn. entire or jagged 1545 Leaves of involucre linear-lanceolate rigid about as long as the head, Leaves usually sinuately jagged
1546 Corona membranaceous, Head ovate, Involucre weak deflexed
1547 Leaves oblong serrate villous stalked sublobate, Cauline connate, Heads globular villous
1548 Corona obsolete, Head globose, Involucre deflexed not quite so long as bracteæ
Corollas 4-cleft.
1549 Corona with 8 nearly eq, awned teeth, Anth. strip. with green at time of open. Br. acum. pub. Corol. radiant 1550 Corolla equal, Cal, imbr, Radical leaves pinnated, Leafl. lanc. cut toothed ciliat, Caul. tern. and sim. lin.
1551 Corollas 4-fid unequal, Scales of calyx obtuse, Leaves oblong serrated scabrous
1552 Corollas equal, Scales of calyx oblong obtuse, Leaves linear smooth entire trifid and at base pinnatifid 1553 Corona with 8 equal short teeth, Bractes awned, Awns purplish black
1554 Corona with 8 teeth of which 4 are awned and the other 4 very short, Br. awned, Awns rufous, Corol. equal 1555 Coroll, sub-equal, Scales of calyx ovate, Leaves pinnatifid
1556 Corona with 8 awned nearly equal teeth, Anth. str. with green at time of op. Br. acum. pub. Corol. radiant 1557 Coroll, radiant, Radical leaves simple, Cauline decurrent pinnated, Paleæ arid reflexed at end
1558 Corona with 4-8 obsolete teeth, Bractes awnless yellowish white the outer obtuse the inner acuminate
$\beta$ Teeth of the corona distorted
1559 Coroll. radiant, Calyx imbricated, Leaves coriaceous smooth lanceolate entire: the upper lyrate 1560 Coroll, equal, Calyx and paleæ awned, Stem simple smoothish, Leaves lanceolate almost smooth Corollas 5-cleft.
1561 Coroll. unequal, Stem herbaceous erect, Leaves pinnatifid, Seeds bearded and feathery pappose Corollas 4-fid.
1502 Coroll. nearly equal, Stem dichotomous, Leaves oblong cauline entire subsessile radical toothed stalked 1563 Cor. equal, Stem simple, Branches approximated, Leaves lanc. ovate pubescent, Caul, lin. nearly entire 1564 Cor. radiant, Leaves undivided, Radical ovate serrated, Cauline lanceolate
1565 Coroll. radiant, Leaves entire pinnatifid and cut, Stem hispid
1566 Coroll, radiant, Leaves all undivided ovate oblong serrated, Stem hispid
1567 Coroll. radiant, Leaves oblong lanceolate entire, Stem below smooth above pilose
1568 Coroll, sub-radiant, Stem and leaves ovate hispid the lower leaves stalked entire auric. or pinn. Calyx cil.

## and Miscellaneous Particulars.

262. Dipsacus. From $\delta$ \& $\downarrow \omega$, to thirst. At the axillæ of the leaves is usually a quantity of limpid water, which may be acceptable to people who are thirsty. This water once had reputation as a cosmetic. Chardon, à Foulon, Fr. Kardendestel, Ger.; and Dissaco, Ital. D. fullonum is cultivated in the west of England for raising the nap upon woollen cloths, by means of the crooked awns or chaffs upon the heads, which in the wild Teasel are not hooked. For this purpose they are fixed round the circumference of a large broad wheel, which is made to turn round, and the cloth is held against them. The seeds are sown in March, on well prepared strong clayey loam, broad-cast, and at the rate of one peck to the acre. They are hoed, like turnips, to a foot distance; and the second year, in August, the heads are fit to cut. They are sold by the bundle or stave, twenty-five in each, and the ordinary produce is 160 staves per acre. In Essex, carraway is often sown along with teasel, and the second year after the latter is pulled, the former is mown or reaped. (Young's Annals, vol. Xxi. p. 53.)
D. pilosus is the handsomest species; the seeds are eaten by small birds, and the flowers trequented by moths in great numbers.
263. Cephalaria. From $\approx \varepsilon ¢ \propto \lambda \eta$, a head, in reference to the manner in which the flowers grow. A mere artificial division of the genus Scabiosa, from which it differs in no natural characters whatever.
264. Scabiosa. From scabies, leprosy. The sudorific qualities of this plant are said to be useful in cutaneous diseases. This is a vigorous-growing coarse-looking genus. S. succisa is one of the few examples of radix pramorsa or bitten-off root; an appearance, as Keith states, owing to the point or top of the seminal root

History，Use，Propagation，Culture．
dying off，in consequence of which horizontal roots naturally protrude themselves．Why it should rot off is not known，but is vulgarly accounted for by ascribing it to a bite from the devil．The same appearance is found in Plantago，Trifolium，and some other plants with subfusiform roots．A decoction of S．succisa is an empirical specific for the gonorrhcea．
S．atropurpurea is the handsomest species，and is cultivated as a border annual and biennial．It has been so long in cultivation that its native country is unknown．Linnæus and Miller consider it as a native of India； Professor Martyn of the south of Europe．
265．Knautia．So named by Linnæus in honor of Christopher Knaut，physician at Halle in Saxony ：born in 1636；died in 1694．Another Knaut（Christian）published a system of plants in 1706，which has nothing to recommend it．
266．Galium．Derived from yad ．milk；because one sort is used for the purpose of curding milk．This is a very natural genus $;$ the roots of most of the sorts dye red，and the herb，like madder，colors the bones of ani－ mals that feed on it．The stems of all the species are four－cornered，and the leaves in whorls；the flowers ge－

Corollas 5-fid.
1569 Hoary, Coroll. radiant, Stem many-flowered, Radical leaves ovate lanceolate entire, Cauline pinnatifid 1570 Calyx very short, Cauline leaves bipinnate filiform
1571 Coroll. radiant, Radical leaves ovate or lyrate pubescent crenate, Cauline pinnate setaceous
1572 Coioll. radiant, Radical leaves oblong crenated, Caul. pinnatifid: the pinnæ linear lanceolate spreading
1573 Coroll. radiant, Leaves smooth, Radical ovate oblong serrate or lyrate, Caul. pinnate : the segr. lin. cut 1574 Coroll. equal shorter than calyx, Leaves lyrate pinnatifid hairy, Stem branched divaricating
1575 Leaves pinnate: the upper linear, Calyces 1-leaved 5-cleft
1576 Coroll. radiant shorter than calyx, Leaves pinnated the upper linear entire
1577 Silky, Lower lvs. stalked roundish or cuneate rugose cren. upper pinnat. Florets uniform longer than invol.
1578 Hoary very soft, Radical leaves obl. crenated upper caul. pinnatifid with ovate or lanc. crenated segm.
1579 Coroll. radiant, Lvs. cut, Recept. of fruit roundish, Outer limb of calyx broad membran. Stem branched 1580 Coroll. radiant, Flowers subsessile, Stem dichotomous, Leaves oblong lanceolate nearly entire pubescent 1581 Coroll, radiant, Leaves cut, Receptacles of the flower subulate
1582 Coroll. radiant, Leaves pinnatifid, Segments linear, Peduncles very long, Stem rounded
1583 Calyx multifid urceolate, Coroll. radiant, Leaves fleshy pinnatifid with linear stiff pinnæ
1584 Coroll. equal, Stem shrubby, Leaves simple erect
1585 Coroll. radiant, Leaves undivided elliptical serrated shining stalked
1586 Coroll. radiant, Leaves lanceolate nearly entire, Stem shrubby
1587 Coroll. radiant, Leaves linear lanceolate entire, Stem herbaceous 1-flowered
1588 Coroll radiant, Radical leaves lanceolate stalked entire, Cauline pinnated, Stem 1-fiowered
1589 Coroll. radiant, Segments entire, Lower leaves oblong coarsely serrated upper pinnatifid at base
1590 Coroll. radiant, all the segments trifid, Leaves undivided subserrate the upper pinnatifid at base
1591 Coroll, radiant longer than calyx, Leaves bipinnate longer than stem
1592 Coroll, radiant, Radical leaves pinnatifid, Cauline linear fringed at base
1593 Coroll radiant, Radical leaves bipinnate with linear leaffets, Cauline pinnate with perfoliate stalks
1594 Coroll. radiant, Radical leaves lyrate, Cauline sub-bipinnate, Calyxes as long as disk
1595 Leaves cut, Cor. 5 longer than calyx
1596 Upper leaves lanceolate entire, Cor. 10 as long as calyx
Fruit smooth.
1597 Leaves 4 ovate lanceolate 3-nerved beneath scabrous, Stem erect simple
1598 Leaves 4 obovate unequal obtuse, Stems diffuse
1599 Leaves 5 reflexed lanceolate awned ciliated, Stem erect simple scabrous
1600 Leaves linear smooth mucronate, Stems 4-cornered diffuse
1601 Leaves 6 linear mucron, roughish, Peduncles trichot. Stems prostrate diffuse 4 angular winged branched 1602 Leaves 8 lanceolate prickly serrate forwards, Panicles trichotomous, Stems smoothish flaccid
1603 Leaves 8 hispid lanceolate linear acuminate subimbricate, Peduncles twice dichotomous
1604 Leaves 8 linear furrowed with stem smooth to the touch, Branches flexible, the flow.-bearing ones short
1605 Leaves 8 elliptical lanceolate obtuse mucronate at the edge rough horizontally spreading, Stem flaccid
1606 Leaves 8 smooth lanc, scabrous beneath, Floral in pairs, Panicle term. Ped, capill. Stem rounded smooth
1607 Leaves 8 linear lanceolate very smooth, Peduncles panicled capillary, Stem rounded
1608 Leaves whorled linear above scabrous, Panicle divaricating, Stem erect rounded pilose roughish
1609 Leaves 8 lanceolate smooth mucronate, Panicle capillary, Petals awned, Stem 4-cornered weak
1610 Leaves $8-6$ ohovate lanc. mucr. rough at edge, Peduncles 3-flow. Petals awned, Stem 4-cornered smoot? 1611 Leaves whorled linear, Peduncles dichotomous flower-bearing from the top of the stem which is smooth 1612 Leaves whorled linear setaceous, Peduncles capillary longer than the leaves
1613 Leaves whorled linear spreading, Peduncles very short
1614. Leaves 6 lanceolate keeled rough aculeate backwards joints simple

1615 Leaves 6 or 8 lanceolate prickly serrate backwards mucronate stiff, Cor. larger than fruit
1616 Leaves 6 linear lanceolate mucronate thin, edges and the stem scabrous, Peduncles bifid, Fruit granular Fruit rough or hispid.
1617 Leaves 4-6 oblong with short point rough at edge, Panicles close, Stem weak short smooth 1618 Leaves 8 lanc, at edge and stem aculeate backwards. Peduncles axillary 3-ff. Fruit granular nodding

## and Miscellaneous Purticulars.

nerally axillary, but sometimes panicled. G. verum, petit Muget, Fr. is called bed-straw, from the verb to strew, strow, or straw; being one among a variety of odoriferous herbs which were formerly used to strew beds with. The bruised plant is sometimes put in milk intended for cheese to give it a flavor and color. Boiled in alum-water, the flowering stems dye a good yellow color, and the roots a red equal to madder. They were once cultivated like that plant, at the recommendation of the Committee of Council for Trade, and yielded $12 \frac{1}{2}$ cwt. of dried roots per acre. G. mollugo, of which there are several varieties, and G. sylvaticum and boreale have similar qualities, though in a less degree.
G. aparine, (from \&etoigo, to lay hold of), has the fruit set with hooked bristles which adhere to whatever they come in contact with, whence it was called by the Greeks Philanthropon (man-lover), and by us cleavers, catch-weed, scratch-weed, \&c.; and from being a favorite food or medicine with geese, goose-grass, \&c. Linnæus informs us, that they use the stalks in Sweden as a filtre to strain their milk through. Dioscorides relates, that the shepherds made the same use of it in his time; and certainly it is no bad thing to take hairs from milk, where a sieve is not at hand. It is reckoned to purify the blood, and for that purpose the tops are

an ingredient in spring-broth. The expressed juice of the herb, taken to the amount of four ounces or a quarter of a pint night and morning, during several weeks, is very efficacious in removing many of those cutaneous eruptions, which are called, though improperly, scorbutic. The seeds have been substituted for coffee. The roots, like those of most of the species, will dye red; and, eaten by birds, tinge their bones of that color. It is a very troublesome weed, particularly in young hedges, but being an annual is easily eradicated.
G. tuberosum is cultivated in China for the roots, which are eaten boiled, either whole or in meal, and Loureiro says, are esteemed salubrious. It has not yet been introduced.
267. Rubia. Froms ruber, red. R. tinctorum has an annual stalk, which trails or climbs, supporting itself in the latter case by its leaves and prickles. Its root is composed of many long thick succulent shoots nearly half an inch in diameter, striking deep into the ground, and growing to the length of three or four feet. From them is procured a well-known red and scarlet dye used by clothiers and callico-printers, and employed to a great extent, though chiefly from foreign roots. England was formerly supplied with this article exclusively from Holland, and as in times of political derangement the price was greatly increased, its dearness induced some patriotic individuals, who had recently set on foot the Society of Arts, to attempt its culture in England. Miller paid great attention to the subject about 1758, publishing separately, as well as in his Dictionary, the Dutch practice as observed by him while in Holland. A. Young, in his "Annals," details several trials; the result of which, and especialiy those of J. Arbuthnot in 1765, proves, that it could be grown here to as great perfection as in Holland, but not sold at so low a price. Its culture was not therefore encouraged, and we are now supplied from Holland, France, Italy, and Turkey, and the cochineal is very generally in use as a substitute, Like others of the natural order of Rubiaceæ, madder tinges with a florid red color the milk, urine, and bones of the animals that feed on the plant. The hardest part of the bones receives the color first, which gradually extends through the whole substance; but if the plant be alternately given and inter-

1619 Leaves 4 lanceolate 3-nerved smooth, Stem erect, Fruit hispid
1620 Leaves 8 lanc. keels and edge scab. acul. backw. Stem flaccid, Joints vill. Fruit covered with hooked hairs 1621 Leaves 4 subovate pilose nerveless, Fruit hairy
1622 Hairy leaves about 6 linear lanceolate, Stems woody
1623 Leaves 6 lanceolate smooth above: their edge and keel beneath scabrous, Stem herbaceous aculeate
1624 Leaves 4 perennial lanceolate above shining smooth their edge and rib beneath scabrous
1625 Leaves perennial 6 elliptical shining, Stem smooth
1626 Leaves perennial elliptical at the edge and keel very prickly, Stem rough shrubby
1627 Leaves perennial linear above scabrous
1628 Leaves perennial 4 cordate oblong stalked 3-nerved above and at the edges scabrous
1629 Leaves 8 lanceolate, Corymbs terminal stalked, Seeds echinate
1630 Lower leaves 4 obovate, upper 5-6-8, Flowers terminal sessile aggregated, Involucres ciliated
1631 Leaves hairy acute 6 longer than the joint, Flowers terminal aggregate sessile longer than involucrum
1632 Leaves 6 linear acute toothletted: the lower hirsute, Flowers aggregate terminal
1633 Leaves 4 ovate lanceolate 3-nerved, Flowers fascicled terminal
1634 Leaves 4 together oblong: the lateral revolute obtuse pubescent
1635 Leaves linear fleshy : the lower 4, Flowers 3 awned
1636 Cauline leaves 4 linear the lower elliptical the upper in pairs all rough awned, Cor. rough
1637 Leaves linear the lower 63 -nerved, the middle 4, the upper opposite, Stem flaccid, Cor. smooth 3-fid
1638 Lower leaves 4 lanceolate upper linear very unequal in pairs, Stem erect, Fruit smooth tubercled
1639 Leaves 4 linear the lower imbricate, Stem much branched at base procumbent, Flowers 4 -fid
1640 Hispid, Leaves 6 oblong-ovate acute revolute at edge, Stems decumbent
1641 Leaves 4 elliptical obsoletely nerved smooth glabrous at edge, Fruit scahrous
1642 Leaves linear the lower $\mathrm{E}_{3}$ middle 4, upper opposite, Stem flaccid, Cor. 4 -fid scabrous outside
1643 Lower leaves 8 and 4, Flowers terminal, Stem and branches scabrous, Involucres naked
1644 Leaves 6 linear : floral in pairs opposite, Branches simple, Flowers two, Fruit hispid subsessile
1645 Smooth, Leaves lanceolate, Stamens included, Flowers whorled, Seeds hairy
1646 Smooth, Leaves ovate, Stamens exserted, Flowers whorled ciliated
1647 Leaves and bractes oblong ovate hispid, Stalks stem-clasping, Flowers capitate, Stamens exserted
1648 Smooth, Leaves subsessile lanceolate acute, Flowers whorled small, Stem procumbent rooting
1649 Smooth, Leaves lanceolate, Whoris globose
1650 Hispid, Leaves obovate oblique, Flowers axillary in pairs
1651 Hairy, Leaves ovate the upper four together, Heads terminal
$165 \%$ Leaves linear-lanceolate lined
1653 Stem decum. rounded smooth, Livs, obl. lanc, atten. at base, Stipules setose, Fl. whorled, Style exserted 1654 Stem erect slightly downy, Leaves stalked oblong acute rough and pubescent at edge, Stamens exserted 1655 Stem erect 4-cornered hairy, Leaves acute entire lined pubescent with very short hairs, Flowers termina. 1656 Stem ascending very smooth 4-cornered, Leaves stalked ovate acuminate thin, Flowers whorled
1657 Resembles Sp. verticillata, but the leaves are shorter and obtuse with a point, at the edge and back rough
1658 Erect, Leaves 6 linear, Flowers spiked 1659 Procumbent, Leaves 4 lanceolate, Flowers spiked

and Miscellaneous Particulars.
mitted, the bones are found to be colored in concentric circles. In medicine, madder was formerly used in complaints of the kidnies.
To cultivate the madder, choose a deep sandy loam, and prepare it by trenching or very deep ploughing. Plant cuttings of the roots in rows, eighteen inches by one foot in the row, in March, and the third year they may be taken up in September. The roots are next kiln-dried, and afterwards threshed to clean them from earth and dust. They are then dried a second time, and immediately afterwards pounded or stamped in a mill. It is cultivated extensively in Zealand, and especially in the isle of Schowen : round Avignon and in Lombardy it is grown on narrow ridges, and irrigated by directing water along the furrows.
268. Asperula. From asper, rough. The species cynanchica is so called from zuver $\chi$ eny, to choak, it being a specific in cases of squinancy. The English name of this genus is supposed to be a corruption of the word woodrowel, the whorls of leaves, according to Turner, representing certain kinds of "rowelles of sporres." All the species, excepting arvensis and cynanchica, will thrive in the shade and drip of trees in a moist sorl. A. odorata has a pleasant scent like Anthoxanthum: it imparts a grateful flavor to wine, an agreeable perfume to clothes, and preserves them from insects. It is eaten by cattle and horses, and from containing an acid principle, with much fixed alkaline salt, has been thought useful in obstructions of the liver and biliary ducts. The roots of A. tinctoria are used in Gothland to dye wool a red color.
269. Sherardia. So named in honor of the famous Sherard, of whose noble garden at Eltham Dillenius's Hortus Elthamensis is a living monument, and whose herbarium is still one of the few things which recommend Oxford to the notice of a botanist. This is a little insignificant weed, by no means worthy to be consecrated to the memory of so celebrated a man.
270. Spermacoce. From $\sigma \pi \varepsilon$ ¢ $\mu \infty$, seed, and $\alpha s \%$, point. The seeds have two remarkable points. The rubbish of the tropics.

History, Use, Propagation, Culture,
271. Crucianella. A diminutive of crux, a cross; some of the roots having their leaves in whorls of four. These are small herbaceous plants of little beauty, natives of the south of France, and rarely seen in this country except in botanic gardens.
272. Callicarpa. From zo $\lambda_{05}$, beautiful, and $\approx \alpha g \pi 05$, fruit. Its berries are of a bright purple color.
273. Witheringia. In honor of Dr. W. Withering, the author of a classification of English plants, which has been one of the most popular of our English botanical works, and deservedly so, although it has now yielded to others of a more modern character.
 $B$ ois de Cabri.
275. Cephalanthus. From $x \in \varnothing \propto \lambda n$, a head, and $\alpha y \theta o s$, a flower; because the flowers grow in heads. This is a low evergreen shrub, with large light green leaves, and the flowers in spherical heads, about the size of a musket bullet. It has a good effect on lawns in scattered groups, or in the front ranks of shrubberies. Sweet says, "soil that has some peat in it suits them best," and that they are readily propagated by layers, or ripened cuttings under a hand-glass. Miller, in whose time the art of striking cuttings was not nearly so well understood as at present, recommends a moist light soil, and propagating from seeds.

1660 Leaves 4 sublinear, Flowers spiked 5-cleft
1661 Diffuse, Leaves 6 revolute at edge, Bract. linear subulate roughish, Flowers scattered
1662 Erect, Leaves 6 linear pubescent, Heads stalked axillary and terminal
1663 Diffuse, Leaves 4 or 2 lin. keeled, Bract. ciliated loosely spiked, Seeds oval covered with obtuse tubercles 1664 Procumbent suffruticose, Leaves 4 mucronate, Flowers opposite 5-cleft
1665 Procumbent, Leaves acute, of the stem in 4 s ovate, of the branches 6 linear, Flowers spiked
1666 Erect, Leaves whorled 8-12 linear lanc. scab. Fascic. of flowers stalked term. and axillary, Cor. 5-cleft
1667 Lvs, ovate acum. uneq. obtusely toothed at base wedge-shaped atten. entire beneath and branches toment. 1608 Leaves ovate toothletted running down the petiole beneath hoary villous, Panic. dichotomous
1669 Leaves ovate rounded at base entire somewhat toothletted rugose above beneath with the branches woolly 1670 Leaves ovate lanc. serrulate reticul. hoary beneath, Corymbs axillary dichotomous longer than petioles 1671 Leaves broad lanceolate serrate roughish beneath, Cymes terminal and axillary

167 2 Stem hairy herbaceous angular, Leaves ovate lanceolate pilose, Stalks 1-flowered umbelled axillary

#### Abstract

1673 Leaves ovate lanceolate acuminate smooth, Branches diffuse, Panic. terminal and axillary, Cal. smooth 1674 Leaves ovate lanceolate beneath and the stalks hairy, Peduncles axillary solitary 1675 Leaves ovate lanceolate with a long point smooth on both sides, Pan. diffuse axillary and terminal 1676 Leaves obovate acuminate smooth on both sides, Pan. axillary and terminal, Stalks and calyxes less pub.

1677 Leaves opposite and ternate oblong oval acuminate
1678 Leaves 3 together, Flowers stalked
1679 Leaves alternate ovate, Flowers sessile
1680 Lvs, ovate smoothish generally shorter than footst. Scape rounded, Spike cyl. slender, Caps. many-seeded 1681 Leaves ohovate shining undulated fleshy sessile, Scape compressed below, Flowers imbric. remote at base 1682 Leaves ovate smooth somewhat toothed, Scape angular, Spike with distinct flowers
1683 Leaves ovate subdenticulate 9-nerved pubescent, Spike cylindrical imbricated, Scape rounded
1684 Leaves ovate pubescent longer than the footstalk, Scape rounded, Spike short cylindrical, Filam. Iilac
1685 Leaves lanceolate ovate pubescent toothletted, Spikes cylindrical pubescent, Scape angular
1686 Leaves lanceolate 5 -nerved toothed smooth, Spike oblong cylindrical, Scape angular
1687 Leaves lanceolate acuminated both ways, Spike short ovate cylind. Scape angular, Caps, 2-seeded
1688 Leaves elliptical, Spike with distinct flowers
1689 Leaves lanceolate somewhat toothed, Spike ovate hairy, Scape rounded
1690 Leaves linear lanceolate toothletted silky, Scapes ascending with appressed hairs, Caps, tumid
1691 Leaves lanceolate linear entire, Hairs scattered, Scapes erect rounded, Spike cylindrical dense
1692 Leaves oblong toothed 5-nerved hairy, Scapes ascending angular hairy, Spike cylindrical dense
1693 Leaves linear nearly entire obtuse fleshy, Scape rounded, Spike erect, Flowers distant
1694 Leaves linear convex beneath a little toothed smooth, Scape rounded hirsute, Spike cylindrical smooth
1695 Leaves broad lanceolate 3-nerved a little toothed pilose, Scape angular, Spike oblong hairy
1696 Leaves lanceolate oblique villous, Spike cylindrical erect, Scape rounded
1697 Leaves lanc. lin. somew, chan. ent. woolly; Scape rounded hirsute, Spike cyl. Stam, not longer than flower 1698 Leaves linear ciliated, Spike cylindrical, Stem hirsute
1699 Subcaulescent, Lvs. lin. lanc. obsol. 3-nerv. toothl. hoary, Spike roundish, Br. winged keeled shorter than 6.
1700 Leaves linear attenuated both ways flat 3-nerved, Scape rounded
1701 Leaves lin. atten. remotely toothed, Scape rounded hairy, Spike obl. acute, Br. ovate membranous at edge 1702 Leaves linear lanceolate hairy longer than the rounded hairy scape, Spike ovate erect, Bractes lanceolate 1708 Leaves linear, Scape rounded very short woolly, Spike roundish nodding

and Miscellaneous Particulars.
276 Scuparia. From scopa, a broom. In the Antilles brooms are made of the twigs. This plant is treated as a tender annual, and after being raised in the hot-house or hot-bed, is potted off, and kept in the greenhouse, or planted out in the flower borders.
277. Centunculus. A name given by the Romans to a small plant found in cultivated lands. The present is a little mean weed of no use or beauty.
278. Plantago. A name of which no satisfactory explanation has been given. Of the species, Psyllium is derived from $\psi v \lambda \lambda 05$, a flea, in allusion to the appearance of its little seeds. Lagopus, from $\lambda \propto \gamma \circ 5$, a hare, and $\pi 85$, foot; its velvety or silky spike resembling the foot of such an animal. Coronopus, from $\approx o g \omega v n$, a crow, and $\pi 85$, foot; its deeply-cut leaf having been compared to a bird's foot. Cynops, signifying dog's-eye, is the name of a plant of Pliny, and one of his plantains. This is a genus of little beauty, and no great utility. Like all other plants known to our botanical forefathers, they were said to have their medical virtues; but that is nothing, or at least but little guide to their absolute use in the arts. P. lanceolata (rib-grass) has been employed in agriculture as a herbage plant, but to which it appears to have no great claim. Where it abounds naturally, it is a certain indication of a dry soil. Haller attributes the richness of the milk in the alpine dairies to this plant and Alchemilla vulgaris, but Linnæus says cows refuse it. This every shepherd knows to be the case as far as

## History，Use，Propagation，Culture，

respects the flower－stalks．Zappa of Milan，and A．Young，speak in high terms of it；but the general feeling and practice of scientific agriculturists is against it，and it is now seldom sown．
P．major is a native of most parts of Europe and of Japan，and always by way－sides，whence its name of way－ bread or way－bred．The seeds afford food to linnets，finches，and other small birds，and the leaves are a com－ mon application to wounds and cutaneous sores．An American negro once received a reward from an assembly of South Carolina for a cure for the bite of the rattle－snake；and in the receipt，it is said by Woodville（Med． Bot．），plantain was a principal ingredient．There are several varieties of this species to be met with in rich pastures and in botanic gardens，such as the rose $\mathbf{P}$ ．，in which the flower appears changed into a tuft of leaves expanded like a rose，and the besom $P$ ．，in which the spike－leaves are imbricate and pyramidal，
P．maritima varies in size and situation more than most plants．Its leaves are sometimes scarcely an inch， and at other times more than a foot in length；and the number of flowers in the spike varies extremely．Like Statice armeria and Sambucus nigra，it is found on the summits of the highest mountains，in the clefts of rocks， on the sea－shore，in salt marshes，and muddy banks．
P．coronopus is a singular－growing plant，with recumbent stems pressing closely on the ground．The leaves have a very peculiar flavor，and are rather disagreeable，but were formerly used in salads．P．psyllium is sometimes imported from the south of France in a dried state for the druggists．
279．Buddlea．In honor of Adam Buddle，a name well known to the English botanist as authority for many rare British plants．B．globosa is a very handsome shrub，and though rather tender，flowers freely in warm situations，or against a wall，with protection in very severe winters．Its leaves are long，narrow，pointed，

1704 Leaves semicylindrical entire woolly at base, Scape rounded
1705 Leaves lin. flat somew, toothed smooth at base, Spike cyl. Scape rounded hairy scarcely longer than leaves
1706 Leaves linear channelled recurved naked
1707 Leaves linear channelled entire beneath with rigid ciliæ hairy at base, Scape rounded pubescent
1708 Leaves spatulate cut-toothed, Teeth imbricated mucronated, Scape rounded hairy
1709 Leaves lanceolate 5 -nerved toothed serrate, Scape rounded
1710 Leaves linear pinnate toothed, Scape rounded
1711 Leaves linear sub-toothed, Scape rounded, Head ovate, Bractes keeled membranous
1712 Leaves ovate entire fleshy rough wooily at base, Capsules 4 -seeded
1713 Stem erect siraple short, Leaves lanceolate fleshy entire stem-clasping hairy, Heads oblong leafless
1714 Stem branched herbaceous, Leaves somewhat toothed recurved, Heads leafless
1715 Hoary, Stem erect branched herbaceous, Leaves nearly entire, Heads leafy and sepals ovate
1716 Herbaceous, Stem branched diffuse decumbent, Leaves linear entire, Heads squarrose
1717 Stem branched herbaceous, Leaves linear entire reflexed, Heads leafy
1718 Stem branched herbaceous erect, Leaves linear channelled entire, Heads leafless
1719 Stem branched herbaceous weak, Leaves subulate entire, Heads leafy
1720 Stem branched suffruticose, Leaves entire filiform straight, Heads somewhat leafy
1721 Stem branched shrubby, Leaves lanceolate toothed, Heads leafless
1722 Leaves lanceolate acuminate crenulate beneath hoary, Heads globose stalked
1723 Leaves lanceolate subserrate hoary underneath, Spikes terminal lengthening with flowers threefold
1724 Leaves lanceolate cordate crenate rugose beneath tomentose, Flowers panicled
1725 Leaves linear lanceolate entire revolute at edge tomentose beneath, Corymbs terminal
1726 Leaves oblong nerved stem-clasping, Bractes cordate perfoliate longer than calyx
1727 Flowers spiked whorled and ternary, Leaves ovate lanceolate, Stem nearly simple
1728 Limb spreading, Stem filiform branched, Radical leaves roundish, Cauline subulate
1729 Flowers 5-cleft, Sepals cordate striated membranous keeled, Stem dichotomous, Leaves cordate
1730 A singular plant found in morasses in North America, and resembling Swertia
1731 Flowers terminal, Leaves cordate acuminate smooth
1732 Leaves rhomboidal wedge-shaped fleshy smooth, Flowers terminal
1733 Anthers exserted awnless, Cal. 4-leaved, Bract. 3 length of cal. Leaves 4 oblong acerose hairy imbricated 1734 Anthers exserted awnless, Leaves 4 ovate smooth, Flower-heads cernuous
1735 Anthers included awnless, Leaves 4 ovate subciliated, Flowers umbelled, Stem flexuose erect
1736 Anthers subexserted awnless, Cal. 1-leaved pilose, Cor, campanulate pilose above, Flowers axillary
1737 Leaves 4 smooth, Calyx lacerated ciliated
1738 Leaves ovate acuminate entire, Peduncles axillary
1739 The only species
1740 Leaves ternate lanceolate, Stamens included
1741 Leaves opp. Cor. clavate, Tube smooth inside

and Miscellaneous Particulars.
rugose, of the color of the common sage, and the flowers are very fragrant. It is commonly propagated by layers; but cuttings of the young wood of all the species root freely in common earth under a hand-glass. Buddea Neemda is one of the most beautiful plants of India.
280. Exacum. The ancient name of a plant nearly related to Centaurium; said to have been derived from $\varepsilon \xi$ and aycs, to conduct out, on account of its properties of expelling poison taken into the stomach.
281. Sebara. A genus nearly related to the last, named after the famous Albert Seba, whose museum was once one of the wonders of Europe.
282. Frazera. After Mr. John Frazer, an indefatigable collector of plants in North America.
283. Penaza. In honor of P. Pena, who published Adversaria Botanica, 1570, in conjunction with Lobel. A handsome genus, readily propagated by cuttings in sand under a hand-glass. Many of the finest species remain to be introduced from the Cape of Good Hope.
284. Blaria. In honor of Patrick Blair, who practised physic at Boston in Lincolnshire, and was one of the fellows of the Royal Society. He published Botanical Essays in 1778. The species resemble some kinds of heaths, and require the same treatment.
285. Chomelia. Named after Pierre Jean Baptiste Chomel, a French botanist, physician to Louis XV.; he died in 1740. Culture as for Siderodendrum.
286. Adina. From w $\begin{gathered}\text { ivos, clustered, its flowers being in heads. A small Chinese plant, with flowers looking }\end{gathered}$ like those of a Cephalanthus. It is probably not different from Cephalanthus.
287. Bouvardia, Named after Dr. Charles Bouvard, formerly a superintendent of the Jardin du Roi at

History, Use, Propagation, Cuiture,
Paris. B. triphylla is a beautiful, and not very tender plant, which flowers great part of the year ; var. $\beta$ has smooth shining leaves, and flowers of a deeper scarlet than the other. B. versicolor requires the warmest part of the green-house, and the cuttings require bottom heat, with the same soil as the plants.
288. Ixora. A name of doubtful origir. Iswara is the name of an Indian divinity. According to Sweet, the species of this beautiful genus "require to be kept in a moist heat to thrive well ; but not plunged in tan, as that is almost certain to injure their roots. A mixture of sandy loam and peat is the best soil for them. Care must be taken to keep them clean and free from insects, or they will not thrive. Cuttings root very freely in sand under a hand glass.
289. Catesbaa. So named by Gronovius, in honor of Mark Catesby, author of the natural history of Carolina, $\& c$. who discovered the first species of this genus. It is very ornamental. C. spinosa has flowers about six inches long, in the form of a Roman trumpet, and succeeded by fruit the size of a pullet's egg; the skin smooth and yellow, and the pulp like that of a ripe apple, with an agreeable taste. It does not fower very. freely, but strikes root readily in sand under a bell-glass, and in moist heat.
290. Pavetto. The name of the plant in Malabar. A small genus nearly related to Ixora, with fowers usually white, as those of Ixora are red.
291. Ernodea. From eqveir,s, branching, in allusion to the habit of the plant.
292. Siderodendrum. From osovpos, iron, and $\delta \in \downarrow \lesssim \circ$, , a tree. Wood, compared for hardness to iron. This tree may be noticed on account of an anomaly which occurs in the corolla, which is often changed, perhaps by some insect, into an oblong bag, half an inch in length, fleshy, and hollow within, and ending in a point at top like a fruit. Cuttings of ripened wood root in sand under a hand-glass.
293. Coccocypsilum. From *arsos, fruit, and $\varkappa v \psi \varepsilon \lambda \%$, a vase, its berry being surmounted by a corona resembling a little cup. Cuttings root freely in sand under a bell-glass.
294. Mitchella. Named after John Mitchell, an Englishman, who travelled in Virginia, and left some papers upon North American plants behind him. This is one of those plants which Humboldt (De Distrib. Plant.) calls

1742
1743 Shrubby spreading, Lvs. oval stem-clasping, Corymbs crowded, Segm. of cor. ovate obt. Berries crowned
1744 Leaves elliptical acute cordate at base sessile, Umbels terminal aggregate, Segm. of cor. ovate acute
1745 Corol. long bearded at mouth, Lvs. opp. obl. entire smooth shining, Floral lvs. round cord, sess. Pan. open
1746 Leaves subsessile oblong smooth, Panicles ovate oblong decussated, Pet. oval, Style hairy
1747 Leaves obl. acute with a contr. emarg. base pubesc. beneath subsessile, Corymbs large, Pet. cuneate acute
1748 Leaves sessile broad lanceolate, Corymbs decompound dense, Pet. obovate reflexed
1749 Shrubby straight, Lvs. subsess. obl. Corymbs dense, Pet. round spreading, Anthers round bristle-pointed
1750 Leaves ovate-lanceolate, Cyme trichotomous contracted
1751 Leaves wedge-shaped lanceolate acuminate, Corymbs terminal, Sepals conical
1752 Leaves coriaceous oval lanc. Cymes decompound close, Petals wedge-shaped obovate, Anthers sessile

1753 Tube of corolla very long, Berries oval
1754 Tube of corolla 4-cornered short, Berries roundish
1755 Leaves smooth entire, Panic. fastigiate axillary and terminal, Style twice as long as corol. Stigma entire
1756 Leaves in $4 s$ oblong obtuse smooth, Stem shrubby
1757 The only species. Branches 4-cornered, Leaves 5-6 inches long elliptic lanceolate
1758 Stem herbaceous creeping, Leaves ovate, Flowers clustered axillary sessile
1759 A little creeping plant with fat round leaves and little scarlet berries
1760 Umbels naked lateral alternate, Leaves linear
1761 Pedunc. many-flowered, Leaves linear lancoolate
1762 Leaves ovate acuminate, Racemes many-flowered, Stem twining shrubby
1763 The only species
1764 Leaves on long stalks ternate, Fruit with two wings
1765 A small prickly shrub, Leaves opposite ovate acute entire. The only species
1766 The only species. Leaves ovate oblong acute serrated opposite
1767 Leaves opposite elliptical obtuse emarginate serrated

and Miscellaneous Particulars.
social, being always found in quantities. Barton says, it is the plant most extensively spread in North America, covering the surface from the 28 th to the 69 th degree of north latitude.
295. Oldeniandia. In honor of H. B. Oldenland, a Dutch naturalist, who travelled in Africa, where he died about the end of the 17th century. O. umbellata, the chay-root, grows on light sandy ground near the sea, and is much cultivated on the coast of Coromandel for dyeing red, purple, brown, and orange, and to paint the red figures on chintz. The coloring matter resides in the bark, which gives it out to water. The Malabar physicians say that the roots cure poisonous bites, colds, and cutaneous disorders, and warm the constitution.
296. Manetlia. In honor of Xavier Manetti, an Italian, and professor of botany at Florence. Some of the species are rather pretty, but they are seldom seen in collections.
297. Epimedium. A name of Dioscorides, applied to this little elegant alpine plant, without any assignable reason.
298. Ptelea. The Greek name of the elm. It is derived from $\pi \tau \alpha \omega$, to fly, in allusion to the winged seedvessels. A hardy shrub of North America, not unlike a laburnum in foliage, but with small green flowers.

29․ Monetia. So named by L'Heritier, in honor of the Chevalier Jean Baptiste Monet de la Marck, a celebrated French botanist, now dead; who, unfortunately for botany, many years ago diverted his attention from that science to conchology. Cuttings root in sand under a bell-glass, and in bottom heat.
300 . Curtisia. Named in honor of W. Curtis, lecturer on botany, author of the Botanical Magazine and other works; he died in 1799. This is one of the largest trees of Africa, from which the Hottentots and Caffres make the shafts of their javelins. It has fine broad leaves, but small flowers, which, however, have not yet appeared in this country.
301. Hartogia. Named after John Hartog, a Dutchman, who travelled in Southern Africa and Ceylon. The plant called by this name in the gardens is probably only a variety of the common laurel, and nearly as hardy as it. The flowers grow in axillary racemes like bunches of currants.

History, Use, Propagation, Culture,
302. Ammannia. Named in nonor of John Ammann, a native of Siberia, who was a physician and professor of botany at St. Petersburg. He published a work upon the plants of Finland, and some papers in the Transactions of the Academy at St. Petersburg. None of the species have any beauty. They may be treated like balsams and other tender annuals.
303. Fagara. The name of an aromatic plant mentioned by Avicenna. The foliage of the present plant has a strong smell of turpentine. Cuttings root readily in sand under a hand-glass.
304. Zieria. So called by Sir J. E. Smith, in honor of his friend Mr. Zier, of whom nothing more is known than that he was " a learned and industrious botanist." The species is a pretty greenhouse plant.
305. Cissus. The Greek name of the ivy. The Latin name hedera having been retained for the real plant ; the Greek word was given to this genus, which climbs like the ivy. The species greatly resemble Vitis in generic character, None of them are ornamental, with the exception of C. quinquefolia, justly admired for its quinquefid leaves, and the different tints of yellow, red, and purple which these take in autumn. It grows rapidly in any soil, and is well adapted for covering naked walls, decorating old unsightly elevations of houses, ruins, cottages, bowers, \&c. All the species root freely by cuttings in any soll.
306. Cornus. From cornu, a horn : the wood being thought to be as hard and durable as horn. Its value as a material for warlike instruments has been celebrated by Virgil - Bona bello cornus. The larger species of this genus are very ornamental and hardy shrubs, not only from therr flower and berries of different colors, but by their green, red, purple, or striped barks, which have a fine effect in winter, especially among evergreens. C. florida blossoms early, but does not bear berries in this country. C. mascula, the Cormier of old authors, blossoms still earlier, and bears handsome fruit, which were formerly made into tarts and rob de cornis: the wood is very hard; and Evelyn says, made into wedges, it will last like iron. C. sanguinea, alba, and sericea,

1768 Leaves stem-clasping, Stem square, Branches erect
1769 Leaves lanceolate attenuated at base, Stem branched, Flowers fascicled axiliary, Caps. 2locular
1770 Leaves sessile lanceolate attenuated at base, Flowers axillary clustered, Sepals rigid acute
1771 Leaves somewhat stalked, Caps. larger than calyx colored
1772 Leaves half stem-clasping, Stem square, Branches much spreading
1773 Leaves half stem-clasping linear lanceolate cordate at base, Pedunc, very short many-flowered

1774 Leaves pinnated, Leaflets obovate emarginated, Common footstalk margined jointed unarmed
1775 Leaves pinnated, Leaflets oblong unequal at base crenate
1776 Leaves pinnated, Leaflets wedge-shaped emarginate, Common stalk winged jointed prickly beneath
1777 The only species. It may be known by the stamens being inserted into large glands
1778 Leaves cordate roundish 3.5 lobed angular repand beneath ferruginous
1779 Leaves ovate loosely serrated smoothish, Nerves glandular at base, Petioles and branches pubescent
1780 Branches rounded subpubesc. Petioles with a pubesc. line, Lower lvs. simple, middle tern.. upper quinate 1781 Leaves ovate serrate toothed, Pedicels and cal. hispid glandular
1782 Leaves ovate cordate smooth thickish bristly serrated, Serratures appressed, Branches rounded
1783 Leaves cordate ovate serrated fleshy, Stem 4-cornered winged
1784 Leaves 5 angular toothed beneath ferruginous, Flowers headed
1785 Leaves cordate serrated, Branches very glatcous
1786 Leaves in fives, Leaflets narrowed each way acuminate stalked, Branches rounded knotted smooth
1787 Leaves ternate obovate wedge-shaped fleshy smooth toothed at end entire at base
1788 Leaves ternate rounded hairy toothed, Branches with membranous angles
1789 Leaves quinate, Leaflets undivided ovate serrated
1790 Leaves quinate, Leaflets obovate wedge-shaped serrated above

1. Flowers in umbels with an involucrum.

1791 Herbaceous, Branches binate, Umbel axillary stalked, Nerves of leaves distinct
1792 Herbaceous, Branches none, Upper leaves whorled stalked veiny
1793 A tree, Involucr. very large colored, Leaflets obcordate
1794 A tree, Umbels as long as involucrum
2. Flowers in naked cymes.

1795 Branches upright, Leaves ovate whole-colored, Cymes depressed flat
1796 Branches recurved, Branchl. smooth, Leaves broad ovate acute pubesc. hoary beneath, Cymes depressed
1797 Branches sprdg. Branchl, woolly, Lvs. ovate acum. beneath ferrugin. Cymes depr. woolly, Nuts compr. 1798 Branches warted, Leaves orbicular beneath hoary, Cymes depressed
1799 Branches upright, Leaves ovate whole-colored naked, Cymes panicled
1800 Branches erect, Leaves ovate acuminate smooth hoary beneath, Cyme panicled
1801 Leaves alternate, Stem dichotomously forked
1802 Leaves oblong
1803 Leaves lanceolate

and Miscellaneous Particulars.
have fine red twigs; the wood of the first is equal to that of the comel for hardness, and makes excellent mill cogs, bobbins for lace, toothpicks, and butchers' skewers. An oil may be extracted from the berries, by boiling and pressing. C. sericea from its large leaves, whitish underneath, and its terminating branches of white flowers, is valuable for the shrubbery or lawn. All the species may be propagated by seeds, layers, suckers, or cuttings; the second is the most common mode.
C. sanguinea is very common in woods, and after a smothered combustion, affords a charcoal esteemed the best for entering into the composition of gunpowder. It grows in the shade and drip of other trees, and is therefore a valuable plant for thickening strips of plantations which have become naked below.
C. suecica is called by the Highlanders Lus-a-chrasis, or plant of gluttony, from its berries, which are eaten by the children, being supposed to create an appetite. This plant is difficult to preserve in gardens; a bed of peat in a shady situation, and kept moist, is the most suitable for it ; or it may be planted in small pots of peat, and treated as an alpine.
307. Santalum. From its Persian name Sundul-sufed. It is a low tree in habits; leaves and inflorescence a good deal resembling the privet. It produces the white and yellow sandal wood of the materia medica, formerly thought to be the produce of different trees, But in India, as in a certain degree in every other country, most trees when large and old, become colored towards the centre, and when the sandal tree becomes large, its centre acquires a yellow color, and great fragrance and hardness ; while the exterior part of the same tree that covers the colored part is less firm, white, and without fragrance. It is only the yellow part that is in use, being in universal esteem for its fragrance. According to Wathen (Voy. to China, 1812, p. 116. ), it sells so high that the tree is seldom allowed to grow more than a foot in diameter. It is manufactured into musical instruments, small cabinets, escrutoires, boxes, and similar articles, as no insect can exist, or iron rust (as it is

## TETRAGYNIA.

1818 Leaves ovate and subcordate acuminate subserrated pubescent
1819 Leaves lanceolate ovate obtuse crenated, Flowers monogynous, Style quadrifid
1820 Leaves elliptical crenated subcoriaceous, Stigmas 2-4 sessile
1821 Leaves ovate acute spiny shining waved, Flowers axillary umbelled

and Miscellaneous Particulars.
bryo. The stalk twines about some other plant, contraxy to the sun's apparent motion, or from right to left, sending out from the inner surface a number of little vesicles which attach themselves to the bark of the supporting plant. By degrees, the longitudinal vessels of the stalk shoot from their extremities, and insinuate themselves so intimately with it, that it is easier to break than to disengage them. Plants raised from seed soon die when they have no plant to which they can attach themselves. They adhere to the ground by the original root, and draw a part of their nutriment from thence at first; but the original root withers away as soon as the young stem has fixed itself to any other plant.
C. eurowa may be sown in peat soil by the sides of other plants; in a wild state it is commonly found in hedges, and on hops, brambles, woody nightshade, fern, thistles, hemp; as also on flax, nettles, clover, grass, \&c.
C. epithymum will thrive well on any small shrub when once it has got hold. According to Sweet, "it will flower freely, and be very handsome."
C. chinensis may be treated like C. europæa.
311. Bufonia. So named after the celebrated Count de Buffon. It is slender, like the botanical acquirements of that illustrious naturalist.
312. Hamamelis. From $\dot{\alpha} \mu \varepsilon$, with, and unday, all apple, from the fruit and fowers being on the tree at the same time. This is a low tree or shrub, in geveral appearance resembling the hazel; but it has fine yellow blossoms, which appear in profusion in Uctober or November, and sometimes last till spring. The fruit, which is a small nut, seldom ripens in England.
313. Hypecoum. From $\dot{u} \pi \eta \chi \varepsilon \omega$, to rattle, on account of the noise the seeds make in the pods. It is not impossible that Hypecoum procumbens is the Hypecoon of Pliny: the wild cumin of Gerarde. The juice of all the species is yellow, like that of celandine, and is said to have the same effect as opium.
314. Myginda. So named by Jacquin, in honor of Counsellor Mygind of Vienna; a botanical amateur and patron. A tree resembling some kind of Ilex.
315. Ilex. A word upon which much ingenvity and learning have been tortured in vain. De Ihéis derives it from ec, or $a c$, a point, in Celtic; but that explanation applies better to the specific name Aquifolium. 1. Aquifolium is one of our most beautiful shrubs or low trees, displaying either character, according to situation, age, and application of art. It is found in most parts of Europe, and in North America, Japan, Cochin-

Fistory, Use, Propagation, Culture,
China, \&c. In Britain, it is found congregated in natural woor's and forests. Some of the finest in England, are in Medwood forest, in Staffordshire, and in Scotland, in the woods of Dumbartonshire, about Luss and Lochlomond. Professor Martyn's father first discovered the difference of sexes in the holly ; some being male, others female, and others hermaphrodite. It is a tree of great longevity, and will grow in any soil not very wet, but best in a dry deep loam ; such is the soil of Medwood forest. By culture alone, a hundred varieties and subvarieties have been produced, differing in the variegation, margin, and size of the leaves, and in the color of the fruit. These make gay and elegant shrubs for lawns and small groups; and form an important feature in the general shrubbery. The common green prickly-leaved holly makes the best of all hedges, whether we regard its qualities for defence, shelter, duration, or beauty. It has one fault, it is very slow of growth unless carefully cultivated, and for this reason hawthorn is preferred. It was a very general custom about the end of the 17th century to divide gardens by hedges of this tree, and to keep them exactly shorn. Evelyn's impenetrable holly hedge at Deptford has been much celebrated. It was 400 feet long, 9 feet high, and 5 feet broad. Gibson, (Archeologia Brit. \&c.) who mentions Evelyn's hedge, made a tour of the principal gardens near London, and states, as next in grandeur, that of Sir M. Decker at Richmond: of neither does there exist a single plant. The largest holly hedge in Scotland is at Tynningham near Dunbar, planted by a former Earl of Haddington, author of a Treatise on Fruit Trees. It has for many years past been left uncut, and now presents a noble phalanx of deep shining green leaves, and numerous spiry tops with spikes of coral berries.
In cultivating the holly, the kernel or stone of the berries is divested of its skin and glutinous pulp, by mixing with sand in heaps in the open garden, and turming over frequently. The berries being gathered in November, may be rotted in this way till the October following, and then sown in beds, and covered three quarters of an inch with fine mould; or they may remain on the trees till spring, then gathered and mashed in a tub of water to separate the pulp, after which they may be sown. In general, the stones do not vegetate till the second year from the gathering; some will occasionally germinate the first year, and a number not till the third. In transplanting and pruning the holly, the months of October and April are to be chosen: the oftener young plants are removed before planted in the final site the better, as it has naturally but few roots, and those chiefly ramose and descending. Miller xecommends cutting holly hedges with a knife, as clipping renders them unsightly. The variegated and other curious sorts are generally propagated by budding and grafting on the common green. Evelyn says he raised some of the variegated sorts by sowing the seeds, and Miller always found the hedgehog variety continue the same when so propagated. Some raise them by layers, and Sweet says all of them " will root freely by cuttings taken off" at a joint in ripened wood, and planted in sand under a hand-glass in a shady situation."

1822 Leaves ovate oblong edge with little cartilaginous scarcely pungent teeth, Corymbs pedunc. dichotomous
1823 Leaves ovate sinuate-toothed slightly spiny, Stipules subulate, Pedunc. lax divided
1824 Leaves ovate acute spiny smooth flat, Flowers scattered at the base of the older branches
1825 Leaves oblong serrated, Serratures prickly-ciliated
1826 Leaves ovate with a point unarmed nearly entire
1827 Leaves elliptic-lanceolate acute deciduous serrated, Serratures unarmed
1828 Leaves alternate distant evergreen lanceolate attenuated both ways serrated at the end
1829 Leaves lanceolate elliptical nearly entire reflexed at the edge, Rib villous beneath
1830 Leaves alternate distant evergreen linear lanceolate shining serrated at end, Rib smooth beneath
1831 Leaves alternate distant oblong obtuse crenated serrated, Serratures not prickly
1832 Leaves oblong acuminate subserrated at the end, Pedunc. long axillary 1-flowered
1833 Leaves wedge-shaped stalked shorter on one side coarsely sawed and plaited
1834 Leaves all elliptical stalked floating, Lower petioles submersed Ieafless
1835 Leaves floating on long stalks lanceolate ovate narrowed at both ends
1836 Upper leaves stalked elliptical narrowed at both ends the lower close together sessile linear
1837 Leaves cordate stem-clasping all immersed
1838 Leaves ovate acuminate opposite close, Stem dichotomous, Spike 4-flowered
1839 Leaves ovate-lanceolate flat narrowed into the stalks, Spike many-flowered contracted
1840 Leaves lanceolate alternate wavy serrated
1841 Leaves linear obtuse, Stem compressed
1842 Leaves setaceous parallel close together in two rows
1843 Leaves lanceolate membranous flat entire, Spike ovate dense few-flowered
1844 Leaves linear lanceolate alternate sessile broader than their stipule
1845 Leaves linear opposite and alternate narrower than their stipule spreading at base, Stem rounded
1846 Leaves lanceolate opposite acuminated
1847 The only species
1848 Branches procumbent smooth, Petals very short
1849 Stem diffuse dichotomous, Leaves spatulate and obovate recurved, Fruit-stalks reflexed

and Miscelloneous Particulars.
I, cassine and vomitoria have bitter leaves, of which the N. American Indians make a tea, which is almost their only physic. At a certain time of the year they come down in droves from a distance of some hundred miles, to the coast, for the leaves of this tree, which is not known to grow at any considerable distance from the sea. They make a fire on the ground, and putting a great kettle of water on it, they throw in a large quantity of these leaves, and setting themselves round the fire, from a bowl that holds about a pint they begin drinking large draughts, which in a very short time occasion them to vomit easily and freely : thus they continue drinking and vomiting for the space of two or three days, until they have sufficiently cleansed themselves; and then every one taking a bundle of the tree to carry away with him, they all retire to their habitations.
316. Coldenia. So named by Linnæus, in honor of Cadwallader Colden, an English naturalist, who published in 1742, an account of the planis of New York.
317. Potamogeton. From rovopos, a river, and reivov, near. Most of the species grow wholly immersed in water, but inke most aquatics, flower above its surface. It should seem, Professor Martyn observes, that the zespiration of such truly-aquatic vegetables must be as different from those which inhale atmospheric air, as the breathing of fishes is from that of beasts and birds. Accordingly, they are, as Haller remarks, of a different texture, pellucid, like oiled paper, very vascular, harsh, and ribbed, but often very brittle; and their surface, like that of aquatic animals, destitute of hair or down of any kind. The leaves of aquatic plants afford shade and spawning places to fish, and habitations for aquatic insects and worms for their nourishment. The roots of $P$. natans are a favorite food of the swan, and that bird is in consequence erroneously considered as keeping ponds and lakes clear of all aquatics. Ducks eat the seeds and leaves of P. crispum. Haller informs us, that in the Swiss lakes P. serratum grows from ten to twenty fathoms long, forming, as it were, immense woods in the midst of these immense reservoirs. Most of the species may be considered as ornamental in a botanic garden, when kept within bounds or in pots. They are readily propagated by seeds or by dividing their long roots, and for the most part, grow best on a clayey bottom.
318. Ruppia. Named after Henry Bernard Ruppi, a German. He published in 1718, a Flora Jenensis. It is remarked by Dr. Goodenough, that the flower-stalk of this plant is spiral, like that of Valisneria, and relaxes or contracts itself according to the depth of the water. The truth is, the flower and leaf-stalks of all aquatics have a power of accommodating themselves to the depth of the water, so as just to emerge above its surface; but the singularity in Ruppia and Valisneria appears to be the employment of a fower-stem for that purpose. (See Valisncria.)

319, Sagina. This plant, says Linnæus, is so called for its qualities. In Latin, sagina expresses something

History, Use, Propagation, Culture,
nourishing. The species are very common in dry pastures, where they are valuable for sheep-food. S. procumbens is a small but troublesome weed in shaded garden-walks and paved courts, and with S. apetala, seeds the whole summer. Curtis remarks, that the latter species ripens its seeds more rapidly than almost any other plant.

Class V. - PEntandria. 5 Stamens.

One of the most extensive of the Linnæan classes, and containing about a fifth part of all phænogamous plants. It includes the whole of the Boragineæ or Asperifoliæ, Asclepiadeæ, Apocyneæ, and Umbelliferæ, nearly all Primulacex, and portions of a great variety of other natural orders, among which many are ornamental, and others valuable on account of their relation to medicine and the arts.
The Boragineæ are, in many instances, ornamental plants; a few, such as Anchusa tinctoria are applied to economical purposes ; but the principal part are weeds of northern latitudes. They have been recently described and re-arranged in a scientific manner by M. Lehmann, whose Monographia Asperifoliarum should have a place in every botanical library.
The curious genus Stapelia is a part of the Asclepiadeæ, which order was in so unsettled and confused a state as to be a reproach to the science until it was remodelled by Mr. Brown, who first determined the just limits of its genera. The Apocyneæ contain, among some poisonous plants, such as Echites venenata, the Oleander remarkable for the beauty of its flowers, and the Cream fruit and Picimmons of Sierra Leone, which are said to be excellent fruit-trees.
Umbelliferous plants contain numerous species, some of which, like the Cicuta virosa, Conium maculatum, \&c. are dangerous poisons, and others which are useful to mankind either as luxuries or necessaries. The seeds of caraway, coriander, \&c. are commonly used by the confectioner, of dill and anise by the distiller; the blanched stems of celery and sweet fennel, and the roots and leaves of many others are among the best of British vegetables. The gum galbanum of the shops is said to be the produce of a plant of this tribe. Great difficulty exists in ascertaining upon what principles the genera should be divided. Linnæus, contrary to his usual practice, attempted to derive the characters from the absence or presence of the involucrum; Hoffman, Link, and Sprengel from peculiarities in the fruit, or, as it is familiarly called, in the seeds. The characters of Sprengel, who has, as it were, grown old in the study of Umbellifere, are certainly deserving of attention ; but botanists are much divided in opinion upon their merits; and, it is to be feared, that notwithstanding the labours of the learned men who have directed their study particularly to the consideration of the order, little real progress has been made in its final arrangement. In this work the arrangement of Sir James Smith has been adopted, as being the most simple of all that has been published, and the most easy of application.

The plants belonging to Primulaceæ are beautiful border-flowers, or pretty alpine plants: In the same artificial section with these, are found the elegant families of Convolvulus and ipomæa, one or several species of which produce the jalap of the shops; the various kinds of Epacris, which in New Holland rival the heaths of Southern Africa, and the splendid genus Azalea.

Other sections include the teak wood of the East Indies; the Sapodilla plum, and the Star apple, fine fruits of the West Indies; solanum, well digested by Dunal ; the Jesuit's bark (Cinchona), of which no species has yet been brought alive to Europe; the coffee tree, and many others.
Pentandria Digynia contains little beyond the Asclepiadeæ and Umbelliferæ, already mentioned. The Sumach, Guelder Rose, and Elder are contained in Trigynia; in Tetragynia the paradoxical and curious Parnassia; in Pentagynia, Crassula, Linum, and Statice, all ornamental genera; and a few obscure weeds make up the last order, Polygynia.

1850 Stem erect pubescent, Flowers alternate apetalous
1851 Stems erect divaricating smooth, Leaves obtuse blunt, Petals obsolete
1852 Stem erect about 1-flowered, Sepals acute, Petals entire
1853 Procumbent, Flowers trifid
1854 The only species

320. Tillcea. From Mich. Ang. Tilli, an Italian, born in 1653, died in 1740. He was a foreign member of the Royal Society of London, and published a Catalogus Horti Pisani, in one volume, folio.
321. Radiola. A diminution of radius. A little insignificant weed, formerly referred to the same genus with common flax.

Order 1. MONOGYNIA.

5 Stamens. 1 Style.

## 1. Flowers monopetalous, inferzor. Seed 1, naked.

322. Mirabilis. Nut below the corolla, which is funnel-shaped. Stigma globose, a little warted,
323. Abroma. Cor. funnel-shaped, with cordate segments, above the germen contracted, at the orifice in-
flated. Stigma simple.
324. Plumbago. Seed 1. Stamens inserted into the valves. Corolla funnel-shaped, Stigma 5-cleft,
325. Flowers monopetalous, inferior. Seeds 2 or more, naked.
326. Heliotropium. Cal. 5-parted. Cor. hypocrateriform, orifice without teeth, limb 5-cleft, sinuses plaited, simple, or toothed. Stamens included. Stigma peltate. Nuts 4 , cohering without a common receptacle.
327. Myosotis. Cal. 5-parted. Cor. hypocrateriform, closed with scales. Limb 5-parted, obtuse. Stamens included. Anthers peltate. Stigma capitate. Nuts 4, distinct, perforated at the base.
328. Echinospermum. Cal. cor. and other parts as in Myosotis. Nuts united to a central column, prickly, compressed, closed at the base.
329. Mattia. Cal. 5-parted, spreading. Cor. tubular, funnel-shaned at the orifice with 5 scales as long as the tube. Anthers sagittate, conniving, exserted. Style longer than stamens. Stigma simple. Seeds winged.
330. Tiaridium. Cor. hypocrateriform, with an angular tube, the orifice contracted with 5 rays. Style very short. Stigma capitate. Nuts 4, 2-celled, mitre-formed, cohering, closed at base. No common receptacle,
331. Lithospermum. Cal. 5-parted, persistent. Cor, funnel-shaped, with a half 5-cleft obtuse limb, and an open orifice. Anthers included. Stigma obtuse, bifid. Seeds 4, hard, smooth, closed at the base,
332. Batschia. Cal. deeply 5-parted. Cor. hypocrateriform, with a hairy ring at the base inside, an open orifice, and rounded segments. Stigma emarginate. Seeds hard, shining.
333. Onosma. Cal. 5-parted, erect. Cor. campanulate, funnel-shaped, with a ventricose tubular 5-toothed limb, and an open orifice. Anthers sagittate, connected at base by their lobes. Stigma obtuse. Seeds ovate, shining, stony, closed at base.
334. Anchusa. Cal. 5-cleft, persistent. Cor, funnel-shaped, with a half 5 -cleft spreading limb, orifice closed with 5 prominent scales. Anthers included. Stigma emarginate. Seeds gibbous, with a sculptured surface.
335. Symphytum. Cal. 5-parted, acute. Cor. cylindrical, campanulate, with a short tube and a tubular inflated limb, orifice with 5 subulate rays conniving into a cone. Stigma simple. Seeds gibbous, not pierced at base.

S35. Onosmodium. Cal deeply 5 -parted. Cor, oblong, campanulate, with a ventricose halr 5 -cleft limb, the edges of which are inflated, orifice open. Anthers sagittate, included.
336. Cynoglossum. Cal. 5-parted. Cor. short, funnel-shaped, with a 5-parted obtuse limb; orifice closed by scales. Stamens included, Stigma capitate. Nuts depressed, attached to a central column.
337. Omphalodes. Cal. deeply 5-parted. Cor. rotate, shorter than the tube of the calyx, with 5 short scales crossing over the anthers, which are inserted into the base of the tube. Style short. Stigma thick. Seeds urceolate, toothed at the edge.
338. Pulmonaria. Cal. prismatic, 5-cornered, 5-toothed. Cor, funnel-shaped, with a cylindrical tube, open orifice, and obtuse 5 -lobed limb. Stigma obtuse. Seeds 4, obtuse, rounded.
399. Cerinthe. Cor. tubular, ventricose. Nuts 2, each 2-celled, open at the base.
340. Borago. Cal. 5-parted. Cor, rotate, with acute segments; orifice crowned. Filaments couniving. Seeds rounded, closed at base, rugose, inserted lengthways into an excavated receptacle.
341. Trichodesma. Cor. rotate, with a naked orifice and subulate segments. Stamens exserted. Anthers villous at back. Nuts half immersed in the 4 -winged column.
342. Asperugo. Cal. 5-parted, irregular. Cor. funnel-shaped, with a short tube, orifice closed by convex scales. Stigma obtuse. Seeds oblong, compressed, not perforated.
343. Nonea. Cal. at length inflated. Cor. funnel-form, with a 5 -cleft short limb, and straight naked tube. Stamens included. Orifice nearly open. Seeds 4, with parallel streaks.
344. Lycopsis. Cor. funnel-shaped, 5-lobed, with a covered tube and obtuse limb. Scales at the orifice. Stigma emarginate. Nuts hollowed at base.
345. Echium. Cal. 5-parted, subulate. Cor. campanulate with unequal obtuse segments, the 2 upper the longest; orifice open. Filaments unequal, declinate. Stigma obtuse. Seeds roundish, warted, not open at base.
346. Tournefortia. Berry 2-celled, cells 2-seeded, perforated at end. Cor. hypocrateriform or rotate, naked at the orifice.
347. Nolana. Cal. turbinate. Cor. campanulate, plaited. Nuts 5, 2 or 4 -celled.
3. Flowers monopetalous, inferior. Seeds in a capsule or dry drupe. (Vestia, which has a berry, is an eaception, but is placed here on account of its relation to other genera.)
348. Aretia. Caps, 1-celled. Corolla hypocrateriform, contracted at the orifice. Stigma globose.
349. Androsace. Caps, 1-celled. Corolla hypocrateriform, contracted at the orifice. Stigma globose.
350. Primula. Caps, 1-celled. Corolla funnel-shaped, pervious at the orifice. Stigma globose.
351. Cortusa. Caps. 1-celled, oblong. Corolla rotate. Stigma somewhat capitate.
352. Soldanella. Caps. 1-celled. Corolla torn, Stigma simple.
353. Dodecatheon. Caps, 1-celled, oblong. Corolla reffexed. Stigma obtuse.
354. Cyclamen. Caps. 1-celled, pulpy within. Corolla reflexed. Stigma acute.
355. Hottonia. Caps. 1-celled. Corolla with the tube below the stamens. Stigma globose.
356. Lysimachia. Caps. 1-celled, 10 -valved, Corolla rotate. Stigma obtuse.
357. Anagallis. Caps. 1-celled, cut round. Corolla rotate. Stigma capitate.
358. Diapensia. Caps. 3-celled. Corolla hypocrateriform. Cal. 8-leaved.
359. Pyxidanthera. Cal. deeply 5-parted. Cor. campanulate, much shorter than the tube of calyx, segments 5, spatulate. Anthers with an appendage at their base Style thick. Stigmas 3.
360. Coris. Caps. 1-celled, 5-valved. Corolla irregular. Stigma capitate.
361. Galax. Caps. 1-celled, 2-valved. Corolla hypocrateriform. Stigma roundish.
362. Menyanthes. Caps. 1-celled. Corolla villous spreading. Stigma bifid. Cal. 5-parted.
363. Villarsia. Caps many-seeded, 2-valved. Cor. rotate, limb spreading, 5-parted, flat, bearded or scaly at the base. Glands 5, hypogynous.
364. Chironia. Caps. ovate, seeds numerous small. Cal. 5-parted erect. Cor. equal, with a 5-parted limb of ovate equal segments. Filaments from mouth of tube. Anthers, after bursting, spiral. Style declinate.
365. Eustoma. Cal, deeply 5-cleft. Tube of cor, funnel-shaped, contracted. Filam. short, regular, inserted about the middle of the tube. St1gma large, deeply 2-lobed. Seeds scurfy.
366. Erythraa. Caps. linear. Cal. 5 -cleft. Cor. funnel-shaped, with a short limb withering. Anthers, after bursting, spiral. Stigmas 2.
367. Sabbatia. Cor. with an urceolate tube, and limb 5-12-parted. Stigmas 2-parted, with spiral divisions.

Anthers at length revolute.
368. Logunia. Caps. 2-parted. Cor. subcampanulate, with a villous throat, and 5-parted limb. Stigma clavate.
369. Phlox. Caps. 3-celled. Corolla hypocrateriform, with a curved tube. Stigma trifid.
370. Polemonium. Caps. 3-celled. Corolla 5-parted. Stamens placed on the valves,
371. Vestia. Berry. Cor. funnel-shaped, 5-parted, with a hairy throat. Stamens exserted. Stigma nearly entire.
372. Hydrophyllum. Caps, 1-celled, 2-valved. Corolla with 5 nectaries. Stigma bifid.
373. Phacelia. Caps, 2valved, 4-seeded. Cal persistent. Cor. campanulate, 5 -cleft, with 5 furrows inside the base. Stam. exserted. Style short. Stigmas 2, long.
374. Ramondia. Caps. 2-valved, valves bent in at edge, septiferous. Cor, rotate, rather unequal. Stamens approximated, perforated at end. Stigma round.
375. Vcrbascum. Caps. 2 celled. Corolla rotate. Stigma obtuse. Stamens declinate.
376. Datura. Caps. 2-celled, 4-valved. Corolla funnel-shaped. Calyx deciduous.
377. Brugmansia. Caps, unarmed. Cal. bursting at side, persistent. Cor. funnel-shaped. Anthers glued together. Stigma or line running down each side of style.
378. Lisianthus. Caps. 2-celled, many-seeded. Corolla funnel-shaped, ventricose. Style persistent.
379. Spigelia. Caps. 2-celled, double. Corolla funnel-shaped. Stigma simple.
380. Nicandra. Berry without juice, 3-5-celled, covered by the calyx, which is inflated. Cor. campanulate. Stamens incurved, distant.
381. Hyoscyamus. Caps. 2-celled, with a lid. Corolla funnel-shaped. Stigma capitate.
382. Nicotiana. Caps. 2-celled. Corolla funnel-shaped. Stigma emarginate.
383. Ipomaa. Caps. 3-celled. Corolla funnel-shaped. Stigma capitate.
384. Convolvulus. Caps. 2-celled, 2-seeded. Cor. campanulate. Stigma 2-cleft.
385. Argyreia. Berry rounded, juiceless, 4-celled. Cal colored, persistent, the outer sepals largest. Cor. 5 -parted, with a short thick tube surrounding the nectary. Stamens in the mouth of tube thickened, at base hairy. Anthers sagittate.
386. Nemophila. Ovary 1-celled, with 2 parietal placentas, each bearing 2 distant ovules. Capsule 1-celled, with fleshy placentas fixed to a longitudinal dorsal axis, otherwise loose, bearing the seeds on their inner surface.
387. Calystegia. Ovary half 2-celled, 4-seeded. Cal. 5-parted, inclosed in two leafy bractes. Cor. campanulate, 5-plaited. Stamens nearly equal, shorter than the limb. Stigmas 2, obtuse.
388. Cobaca. Caps, obovate, 3-5-celled, 3-5-valved. Seeds imbricated, edged. Cal. 5-cleft, campanulate, 5 -cornered, winged. Cor. campanulate, with 5 blunt lobes. Stamens declinate, filaments spiral.
389. Cantua, Caps, 3-celled, 3-valved. Seeds winged. Corolla funnel-shaped. Stigma trifid.
390. Hoitzia. Caps. of Cantua. Seeds not edged. Cal. double, inner 1-leaved, tubular, outer of 4-8 leaves. Cor. funnel-shaped, $4-5$ times as long as calyx, a little incurved. Stamens inserted into base of tube.
391. Retzia. Caps. 2-celled. Corolla cylindrical, villous on the outside. Stigma bifid.
392. Lubinia. Caps. many-seeded, mucronate, when pressed of 24 valves. Cal. 5 -parted. Cor. hypocrateri-
form, with a flat 5 -parted equal limb. Filaments attached to middle of tube. Stigma obtuse.
393. Epacris. Caps, with placentas attached to a central column. Cal. colored, with many bracteæ. Cor. tubular, with a beardless limb. Stamens on the petals. Scales 5, hypogynous.
394. Styphelia. Drupe juiceless, with a solid bony putamen. Cal. 5-parted, with many bracteæ. Cor. in a
long tube, having within 5 bundles of hairs, and bearded reflexed segments. Filaments exserted.
395. Lissanthe, Drupe berried, with a bony solid putamen. Cal. With 2 bracteæ or more. Cor. infundibuliform, not bearded. Ovarium 5-celled.
396. Astroloma. Drupe juiceless, with a solid bony putamen. Cal, with 4 or more bracteæ. Cor. ventricose, twice as long as calyx, with 5 bundles of hairs inside, and a short spreading bearded limb. Filaments linear included.
397. Sprengelia. Caps, with placentas attached to a central column. Cal. colored. Cor. 5 -parted, rotate, beardless. Stamens hypogynous. Anthers connate or not. No hypogynous scales.
398. Andersuaia. Caps. of Sprengelia. Cal, colored, with 2 or more leafy bracteæ. Cor. the length of the
calyx, the segments of the limb bearded at the base. Stamens hypogynnus. Scales 5 , hypogynous, sometimes connate.
399. Lysinema. Caps, of Sprengelia. Cal. colored, with many brarteæ. Cor, hypocrateriform, with a tube sometimes 5 -partiole, with beardless segments bent to the right. Stamens hypogynous, Scales 5, hypogynous.
400. Monotoca. Drupe berried. Cal. with 2 bracteæ. Cor. funnel-shaped, with the limb and throat beardless. Ovary 1-seeded.
401. Leucopogon. Drupe berried or juiceless, sometimes crustaceous. Cal. with 2 bracteæ. Cor. funnelshaped, with a spreading limb bearded lengthwise. Filaments included. Ovary 2-5-celled,
402. Stenanthera. Drupe juiceless, with a solid bony putamen. Cal. with many bracteæ. Cor, tubular, longer than the calyx, ventricose, with a short spreading half-bearded limb. Filaments included, fleshy, broader than the anthers.
403. Azalea. Caps. 5-celled. Corolla campanulate. Stigma obtuse.
404. Chamaledon. Caps. 2-celled, opening at the end. Cal. 5-parted, equal. Cor. campanulate, 5-cleft, unequal. Stamens inserted into the base of cor. equal, straight, included. Anthers opening lengthwise. Style straight.
405. Brexia. Cal, short, with 5 rounded lobes. Petals ovate, spreading, rounded. Filam. dilated at base. Bristles shorter than the stamens, about the ovarium.
406. Ophiorhiza. Caps. 2-celled, 2-parted. Corolla funnel-shaped, villous at mouth, with acute segments. Stigma bifid.
407. Allamanda. Caps. 1-celled, lens-shaped, 2-valved, the valves being boat-shaped. Seeds imbricated.
408. Theophrasta. Caps. 1-celled, very large. Corolla campanulate. Stigma acute.
409. Clavija. Caps. 1-celled, very large. Corolla rotate, with 5 prominences in the centre. Filaments 5, united into a tube at the base of the corolla.

## 4. Flowers monopetalous, inferior. Seeds in a follicle.

410. Vinca, Cal. 5-cleft. Cor. hypocrateriform, plaited at the orifice, with flat segments, truncate at the end. Filaments at the end dilated into concave scales. Glands 2 at base of ovary.
411. Nerium. Cor. hypocrateriform, crowned at the mouth with little lacerated appendages, segments of cor. twisted. Filaments inserted into middle of tube. Anthers sagittate, adhering to the stigma by the middle. Little teeth at the base of the calyx outside the corolla.
412. Wrightia. Cor. hypocrateriform. Mouth crowned by 10 divided scales. Stam. exserted. Filaments inserted into throat. Anthers sagittate, adhering to the stigma by the middle. Scales 5-10, inserted into base of calyx outside of corolla, some hypogynous.
413. Echites. Cor, hypocrateriform, with segments of the limb unequal-sided. Ovaries 2. Style 1, filiform. Follicles slender.
414. Ichnocarpus. Cor hypocrateriform, with segments of limb halved. Ovaries 2. Style 1, filiform. Stigma ovate, acuminate. Filaments 5 , hypogynous, alternate with the stamens.
415. Plumieria. Cor. funnel-shaped, with a flat limb, and ovate-oblong oblique segments. Filaments from the middle of tube. Anthers conniving. Styles scarcely any.
416. Strophanthus. Cor. funnel-shaped, with segments caudate, mouth crowned with 10 entire scales. Stam inserted into middle of tube. Anthers sagittate, aristate, or mucronate. Style filiform, dilated at end. Stigma cylindrical.
417. Cameraria. Cal. very small. Cor. funnel-shaped or hypocrateriform, with a long tube inflated at both ends, and a flat limb, with 5 lanceolate oblique segments. Filaments in the middle of tube. Ovaries, with appendages at their sides. Styles scarcely any.
418. Tabernamontana. Cor. hypocrateriform. Stamens included. Anthers sagittate. Ovaries 2. Style filiform Stigma dilated at base, bifid. Seeds immersed in pulp.
419. Amsonia. Cor. funnel-shaped, closed at the orifice, with a 5 -lobed limb. Stigma capitate, surrounded by a membranous angle. Seeds obliquely truncate, naked.

## 5. Flowers monopetalous, inferior. Seeds in a drupe or berry.

420. Cerbera. Cal. persistent, 5-parted. Cor. funnel-shaped, with a clavate tube and 5-cornered throat, with 5 scales, segments of limb oblique obtuse. Stigma fringed, bifid. Drupe bony, 2-celled, 4-valved. Seeds 1-2, covered with a fleshy skin.
421. Tectona. Cal. campanulate, with $5-6$ lobes. Cor. funnel-shaped, the length of calyx, with a short tube, and 5-6-parted crenulate limb. Stamens under the throat of corolla. Drupe globose in the inflated calyx, 3-4-celled.
422. Caldasia. Cal. tubular. Cor. tubular, 2lipped, with emarginate segments. Filaments declinate. Drupe 3-angular, 3-valved, 3-seeded.
423. Bumelia. Cal. 5-parted, very small. Cor. campanulate, 5 -cleft, or hypocrateriform, with teeth between the divisions of limb. Nectary a 5-leaved crown, adhering to the tube of the corolla. Drupe ovate or globose.
424. Chrysophyllum. Cal. 5-parted, small. Cor. campanulate, short. Filaments on the tube connivent. Style very short. Stigma obtuse, 5 -cleft. Berry 10 -celled, with solitary shining seeds,
425. Siderorylon. Cal. 5-toothed. Cor. 5-cleft. Scales of nectary five. Stigma simple. Berry 5 -seeded.
426. Jacquinia. Cal. 5-leaved. Cor. with a campanulate ventricose tribe, and 10 -cleft limb. Stamens hypogynous. Anthers hastate. Stigma capitate. Berry roundish, 1-celled, 1-seeded.
427. Achras. Cal. 5-6-parted. Cor. ovate, 5-6-cleft, with as many scales on the throat. Berry or apple teated, 1-celled. Seeds solitary, with a marginal hilum, and a claw at the end.
428. Cordia. Cal. tubular, 4-5-toothed. Cor. funnel-shaped, 4-5-cleft. Style dichotomous. Stigmas 4 Drupe covered by the calyx, 1-4-celled. Cotyledons plaited.
429. Varronia. Cal. tubular, 5-toothed. Cor, tubular, with a 5 -cleft, spreading, plaited limb. Style dichotomous. Stigmas 4. Drupe 4-celled, 4-seeded.
430. Ehretia. Cal. deeply 5-cleft. Cor. funnel-shaped, with a naked throat. Stamens exserted. Style semibifid. Berry 2-celled, 2-seeded.
431. Bourreria. Cal. campanulate, half 5 -cleft, very small. Cor. longer than calyx, with a plaited limb. Stam. as long as cor. Stigma obtuse edged. Berry roundish, 1-celled, with 4 convex seeds.
432. Ellisia. Cal. 8-parted. Cor. funnel-shaped. Stam. inserted in base of corolla. Stigma simple or bifid. Berry dry, scrotiform, 2-valved, 2-celled, in an enlarged stellate calyx. Seeds globose, black, dotted.
433. Sersalisia. Cal. 5-parted. Cor. 5-cleft. Stamens 5, sterile, scale-like, with as many alternate fertile ones. Ovary 5-celled. Stigma undivided. Berry $1-5$ seeded. Seeds with a crustaceous skin, and longitudinal hilum.
434. Manglilla. Cal very small, 5 -parted. Cor, rotate, 5 -parted. Scales of nectary none. Drupe or berry 1 -celled, 1 -seeded.
435. Ardisia. Cal, 5-parted. Cor. hypocrateriform, with a reflexed limb. Anthers large, erect. Stigma simple. Drupe fleshy, superior, 1 -seeded.
436. Arduina. Cor. funnel-shaped, curved. Stigma bifid. Berry 2-celled. Seeds solitary, oblong.
437. Strychnos. Cor. tubular, 5-cleft. Berry 1-celled, with a woody coat, A Contorta.
438. Carissa. Cal, short. Cor, tubular. Stamens included. Berry 2-celled. Cells 1-2 or many-seeded. A Contorta.
439. Prederia. Cal. 5-toothed. Cor, infundibuliform, 5-lobed, hairy within. Style bipartite. Berry brittle, shining, 2 -seeded.
440. Gelsemium. Cal. 5-toothed. Cor. infundibuliform. Limb spreading, 5-lobed, nearly equal. Caps. compressed, flat, 2partible, 2-celled. Seeds flat, attached to the margins of the valves.
441. Rauwolfia. Cor, tubular, globose at base. Berry succulent, 2 seeded, A Contorta.
442. Vallesia. Cal very small, 5-fid. Cor. hypocrateriform, or infundibuliform, with a long slender tube, an inflatod throat, and a flat limb with 5 lanceolate spreading segments. Stamens inserted in the throat. Drupes 2, 1-celled, 1 -seeded. Nut fibrose, striated.
443. Bacobotrys. Cor. tubular, 5-cleft. Calyx double, superior : outer 2-leaved, lower campanulate, 5-toothed, Berry 1-celled, many-seeded.
444. Solandra. Cal. bursting. Cor, clavate, funnel-shaped, very large. Berry 4-celled, many-seeded.
445. Cestrum. Cal. funnel-shaped. Segments acute, edged. Stamens with or without a tooth. Anthers 4-tornered. Berry 1-2-celled. Seeds few, angular.
446. Atropa. Cor. campanulate. Stamens distant. Berry globose, 2celled, sitting on the calyx.
447. Mandragora. Cal. turbinate. Cor. campanulate. Filaments dilated at base. Ovary with 2 glande Berry fleshy, solid. Seeds reniform.
448. Physalis. Cor. campanulate, rotate. Stamens conniving. Berry within the inflated calyx, 2 celled.
449. Saracha. Cor. rotate, campanulate. Berry 1-celled. Receptacle fleshy.
450. Lycium. Cor. tubular, with a closed orifice. Filaments bearded. Berry 2-celled, many-seeded.
451. Solanum. Cal. persistent. Cor. rotate or campanulate, 5-lobed, plaited. Anthers in some degree united, opening by a double pore at the end. Berry 2-celled, many-seeded.
452. Nycterium. Cal, 4-5-cleft. Cor. rotate, unequal. Anthers declinate, conniving, the lowest longest. Berry 2-celled, many-seeded.
453. Capsicum. Cor, rotate. Berry without juice.
454. Leea. Cor, monopetalous. Nectary 1-leaved, placed on the tube of the corolla, 5-cleft, erect. Berry 5-seeded, inferior.
455. Flowers monopetalous, superior. Seeds in a capsule.
456. Spermadictyon. Caps. inferior, 1-celled, 5-valyed. Seeds 5 , with a netted coat. Cor. funnel-shaped. Stigma 5-cleft.
457. Dentella. Cal. 5-parted, superior. Cor, funnel-shaped, with 3-toothed divisions. Caps. 2-celled, manyseeded.
458. Macrocnemum Cal. campanulate, cup-shaped. Cor. campanulate or funnel-shaped. Caps. 2celled. Seeds imbricated.
459. Exostemma. Cal. campanulate, 5-toothed. Cor, funnel shaped. Limb 5-parted, usually hairy. Caps, oblong, rounded, 2-celled, 2 partible. Sceds nuinerous, with a membranous edge.
460. Burchellia. Heads of flowers in an involucrum. Cor. clavate, funnel-shaped, with a 5-cleft short limb and a beardless orifice. Segments before expansion twisted together. Stamens inserted above the middle of the tube. Anthers subsessile, included. Stigma clavate. Berry crowned by the deeply 5 -cleft calyx, 2-celled, many-seeded.
461. Rondeletia. Cor funnel-shaped. Tube ventricose at top. Segments rounded, flattish. Caps. round, crowned, 2-celled. Seeds several or solitary.
462. Coutarca. Cal. 6-leaved. Cor. large, funnel-shaped, 6-cleft, with an incurved ventricose tube. Filaments inserted at base of tube. Caps, 2-celled, 2-valved, many-seeded. Seeds with a membranous edge.
463. Portlandia. Cal. 5-leaved, Cor. clavate, funnel-shaped. Segments spreading, deflexed. Caps. 5-cornered, retuse, crowned, 2-celled, 2-valved. Valves doubled, 2-cleft, many-seeded.
464. Campanula. Cor. campanulate, closed at bottom with staminiterous valves. Stigma 3-5-cleft. Caps. inferior, opening by lateral pores.
465. Lobelia. Cor. with the tube split on one side, the limb 2-lipped, 5-parted. Stigma 2-lobed, sometimes entire. Caps. 23-celled, 2-valved at end.
466. Phyteuma. Cor. at first rounded conical, afterwards 5-parted with linear weak segments. Stigma 2 or 3-cleft. Caps. 2-3-celled, inferior.
467. Trachelium. Cor. funnel-shaped. Style long. Stigma globose. Caps. 3-celled, inferior.
468. Roella. Cor. funnel-shaped, closed at bottom with staminiferous valves. Stigma 2-fid. Caps. nearly 2 celled, cylindrical, inferior.
469. Goodenia. Cor. labiate, 5-cleft, waved, longitudinally split, pushing forth the stamens. Anthers linear. Stigma urceolate, ciliated. Caps. 1-2-celled, 2-valved, many-seeded. Seeds imbricated.
470. Euthales. Cal tubular, 5-cleft, equal. Cor. split at the end, with a 2-lipped limb. Anthers distinct. Style undivided. Stigma 2-lipped. Caps. 4-valved, 2 celled at base.
471. Dampiera. Cor. 2lipped. Tube split on one side. Segments of upper lip with an auricle upon the inner edge. Anthers cohering. Covering of stigma naked.
472. Samolus. Cor. hypocrateriform, 5-cleft, with scales between the divisions. Stamens inserted into the tube. Caps, 1-celled, 5-toothed, many-seeded.
473. Velleia. Cal, 3-5-leaved, unequal. Tube split at end with a 2-lipped limb. Anthers distinct. Style undivided. A gland between the two front stamens.

## 7. Flowers monopetalous, superior. Seeds in a drupe or berry.

473. Scavola. Cor. 1-petalous, with the tube divided lengthwise. Limb 5-cleft, lateral. Drupe inferior, 1 -secded. Nect. 2 -celled.
474. Caprifolium. Cal, 4-5-toothed or entire. Tube of cor. long, with a 5-cleft, regular, or 2 -lipped limb. Stamens length of cor. Stigma globose. Berry distinct, 3-celled, many-seeded.
475. Lonicera. Cal 5-toothed. Cor. tubular, 5-cleft, irregular. Berry inferior, 2-3-4-celled, many-seeded.
476. Symphoria. Cal. 4-toothed. Cor. trifid, nearly equal. Berry crowned, 4 -celled, 4 -seeded, 2 cells sometimes abortive.
477. Diervilla. Cal. oblong, 5-cleft. Cor. twice as long, funnel-shaped, 5-cleft, spreading. Caps. oblong, 4-celled, many-seeded.
478. Triosteum. Cal. 5-cleft. Cor. scarcely longer, tubular, 5-lobed. Berry 3-celled, 3-seeded, inferior.
479. Coffea. Cal increasing, 5-toothed, teeth deciduous. Cor, hypocrateriform. Stamens above the tube.

Anthers sagittate. Berry 2-seeded. Seeds with an arillus, on one side convex, on the other flat.
480. Chiococca. Cor. funnel-shaped, equal. Berry compressed, double, 2-seeded. Seeds oblong, compressed. 481. Serissa. Cor, funnel-shaped, fringed at the throat, with segments of the limb 3-lobed. Berry 2 seeded.
482. Canthium. Cal, 5-cleft. Cor. 5-cleft, spreading. Style elevated. Stigma capitate. Berry coated, 2-celled, 2-seeded. Seeds on one side convex, on the other flat, with a longitudinal furrow. Prickly.
483. Psychoivia. Cal. 5-toothed, crowning. Cor. funnel-shaped. Berry globoseor oval. Seeds 2, furrowed, bony.
484. Hamelia. Cor. 5-cleft. Berry 5-celled, many-seeded. Racemes divided. Flowers 1-sided.
485. Posoqueria. Cal. turbinate. Cor. hypocrateriform, with a long cylindrical curved tube which is dilated at end, with long narrow reflexed segments. Stamens exserted.
486. Vanguiera. Cor. campanulate, globose, with a hairy throat. Stigma of 2 lips. Berry apple-shaped, 4-5-celled, 4-5-seeded.
487. Gardenia. Segments of the cal. vertical or oblique. Cor, at first thisted, funnel-shaped, 5-9-cleft, with a tube usually long. Style elevated. Stigma 2-lobed. Berry 2-celled, many-seeded. Seeds in a double row.
488. Genipa. Cal. tubular or turbinate, entire. Cor, hypocrateriform, with a large 5-parted limb. Anthers sessile in the throat, exserted. Stigma clavate, entire, or simple. Berry large, fleshy, truncated at the end, 2-celled, many-seeded.
489. Oxyanthus. Cal. contracted at top. Cor. funnel-sbaned, with a verv long rounded tube, and a 5 -parted limb, with very acute lobes. Anthers exserted.
490. Randia. Cal. 5-parted, with linear-lanceolate, twisted sepals. Cor. hypocrateriform, tube not much longer than calyx. Stigma 2-lobed, with oblong unequal lobes. Berry half 2 -celled, with an incomplete partition; crowned with the tubular calyx. Seeds many.
491. Musscenda. Cor. funnel-shaped. Stigmas 2, thickish. Berry oblong, 2-celled, many-seeded. Seeds in 4 rows. Stamens in the inside of the tube.
492. Pinckneya. Sepals unequal, one or two of them foliaceous. Cor. a long tube. Filaments in the base of the tube. Caps. 2-valved, valves bearing the divisions in the middle.
493. Erithalis. Cal urceolate. Cor. 5 -parted, with recurved segments. Berry 10 -celled, 10 -seeded.
494. Webera. Cor. funnel-shaped, spreading. Stamens included. Stigma clavate. Berry rounded, twocellet.
495. Plocama. Cal. 5-toothed. Cor. campanulate, 5-cleft. Berry 3-celled, with 1-seeded cells.
496. Morinda. Flowers collected in a globe above a spherical receptacle. Cal. 5-toothed. Cor. funnelshaped, 5 -cleft, spreading. Berries aggregate, on account of their mutual compression angular.
497. Cephaelis. Flowers headed in an involucrum. Cal. 5-toothed. Cor. tubular. Stigma 2-parted. Berry 2-seeded. Receptacle chaffy. Involucrum 1-5-leaved.
498. Sarcocephalus. Flowers in a naked head, 5-parted. Stigma clavate. Fruit united into a great fleshy tessellated berry.
8. Flowers polypetalous, inferior. Seeds in a drupe, berry, or bervied capsule.
499. Hirtella. Pet. 5. Filam. very long, persistent, spiral. Berry 1-seeded, Style lateral.
500. Triphasia. Flowers with their parts ternary. Stamens distinct. Anthers sagittate. Berry 3-celled 3 -seeded.
501. Vitis. Petals cohering at the end like a calyptra, withering. Berry 5 -seeded.
502. Ampelopsis. Cal. entire. Petals cohering at the end, withering. Stigma capitate. Ovary immersed in the disk, $2-4$-seeded.
503. Rhamnus. Cal. campanulate, 4-5-cleft. Cor. scales protecting the stamens, inserted into the calyx. Stigmas 1-2-5-cleft. Berry 3-4-seeded.
504. Enoplia. Cal, urceolate, 5-cleft. Petals 5. No fleshy discus. Drupe juicy, 2-celled, one cell being usually abortive, 1 -seeded.
505. Paliurus. The flowers of Zizyphus. Styles 3. Drupe dry, 3-celled, surrounded by a membranous orbicular wing.
506. Zizyphus. Cal. spreading, 5-cleft. Petals 5. Discus fleshy, orbicular, surrounding the ovary. Styles 2. Drupe with a 1 or 2 seeded nut. Flowers axillary.
507. Celastrus. Cor. 5 petals, spreading. Caps, 3, angular, 3-celled. Seeds with an arillus.
508. Senacia. Cal. very small, 5 -toothed. Cor. 5 petals. Caps. spherical, stalked, 2-valved, 4-seeded. Seeds angular, naked.
509. Euonymus. Pet, 5. Caps, 5-cornered, 3-celled, 3-valved, colored. Seeds with an arillus.
510. Ceanothus. Pet. 5, bagged, vaulted. Berry dry, 3-celled, 3-seeded.
511. Staavia. Flowers aggregate. Stamens inserted into the calyx. Styles 2, united. Berry 5 -seeded,
coated. Rereptacle chaffy, villous.
512. Pomaderris. Cal, turbinate, Petals arched, scale-like, sometimes none. Style 3-cornered. Stigmas 3 , capitate. Caps. of 3 papery divisions.
513. Mangifera. Pet. 5. Drupe reniform.
514. Schrebera. Drupe dry, with a 2-celled nut. Nectary an elevated edge.
515. Billardiera. Petals 5, alternate with the sepals. Nectary O. Stigma simple. Berry many-seeded
516. Elcodendrum. Sepals 5-10, with round concave scales. Cor. 5-parted. Segments ovate, lanceolate, concave. Nect. linear, subulate, petal-like. Drupe dry, with a 2 or 3-celled nut. Putamen thick, hard, furrowed.

## 9. Flower polypetalous, inferior. Seeds in a capsule.

517. Diosma. Cal. 5-parted. Petals and stamens inserted in the calyx. Nect. of 5 plaits. Ovary crowned. Caps. 5 -valved. Each end with an elastic arillus.
518. Adenandra. Cal. 5-parted. Pet. and stamens inserted in the calyx. Stamens 10, of which every other one is sterile. Anthers with a gland at end
519. Baryosma. Cal. 5-leaved. Petals 10, unequal, inserted in the receptacle. Nect. a 5 -lobed gland inserted on the recentacle
520. Agathosma. Cal. 5-parted. Petals 10, unequal, inserted in the calyx. Nect. 5-lobed, inserted in calyx.
5k1. Nauclea. Cal. about 5-toothed. Cor. funnel-shaped. Caps. 3-cornered, 2-celled, many-seeded. Flowers in a globose head upon a common pilose receptacle.
521. Pittosporum. Cal deciduous. Petals 5, conniving in a tube. Caps, 2-5-celled, 2-5-valved. Seeds pulpy.
522. Lasiopetalum. Cal. 5-leaved. Petals minute, gland-like. Filaments 5, separate. Anthers opening by two pores inwards. Stipules none
523. Thomasia. Cal. persistent, veiny. Pet. 5, very small or O. Filam. united at base. Anthers opening laterally. Stipules leafy.
524. Scringia. Cal. withering. Pet. O. Filain. 10, every other one barren. Anthers opening at their back. Stipules small, deciduous.
525. Buttneria. Pet. 5. Nect. 5-leaved. Filaments inserted into the end of the nectary. Caps. of 5 divisions, muricated,
526. Ayenia. Cal. 5-parted. Pet. 5 , connected at end into a star, with their claws slender, bent into the form of a crown Glands 5, stamen-shaped. Nectary cup-shaped. Caps, depressed, 5-furrowed, 5-celled, 5-valved. Valves bifid.
527. Calodendrum. Cal. 5-parted, short. Petals lanceolate, stalked. Stam. 5, sterile, petal-shaped. Caps, 5 -angular, 5 -celled, 5 -valved, with 2 -seeded cells.
528. Toddalia. Cal. 5-cleft. Petals 5. Stigma capitate. Caps, berried, 5-celled. Cells 2 -seeded.
529. Bursaria. Cal. inferior, 5-toothed. Pet. 5, linear. Stigma simple. Caps, cordate, compressed, 2 -part. ible, 2-seeded. Seeds reniform,
530. Cedrela. Cal withering. Cor, of 5 petals, funnel-shaped, at base united $\frac{1}{3}$ with the receptacle. Cans. woody, 5-celled, 5-valved. Seeds with a membranous wing.
531. Hovenia. Cal. 5-parted. Pet. 5, convolute. Stigma 3-fid. Caps. 3-celled, 3-valved. Cells 1-seeded.
532. Brunia. Flowers aggregate. Cal. superior, 5-parted. Filaments inserted into the claws of the petals. Stigma 2-fid. Caps. small, 2-celled.
533. Brossaea. Cal. fieshy, superior. Cor. conical, truncated. Caps. 5-furrowed, 5-celled, covered by the persistent calyx, with 5 -fissures.
534. Itea. Cal. 5-cleft, campanulate. Pet. 5, linear, reflexed, inserted into calyx. Stigma capitate, 2-lobed. Caps. 2celled, 2-valved, with the valves bent inwards.
535. Cyrilla. Cal. very small, turbinate, 5-parted, superior. Pet. 5, stellate, stiffish. Styles 2-fid. Berry dry, 2-celled. Seeds solitary, attached by a little cord.
536. Claytonia. Cal. 2-valved. Pet. 5. Stigma 3-fid. Caps. 3-valved, 1-celled, 3-seeded.
537. Impatiens. Cal. 2-leaved. Pet. 5, irregular, with one cucullate. Anthers at first subconnate. Caps. superior, 5-valved.
538. Sauvagesia. Pet. 5, fringed. Sepals 5. Nectary 5-leaved, alternate with the petals. Caps, 3-celled, 3 -furrowed, 3 -valved, with the edges bent inwards,
539. Viola. Sepals 5. Petals 5, irregular, connate behind. Anthers adhering at the end by a membrane, or distinct. Caps. 3-valved, 1 -seeded.
540. Ionidium. Sepals 5 , produced at their base Cor. 2lıpped, without a spur. Anthers usually distinct. Stigma simple. Caps. 1-celled, 3-valved.

## 10. Flowers polypetalous, superior.

542. Phylica. Cal, 5-parted, turbinate, Pet. O. Scales 5, protecting the stamens. Caps. 3-coccous, inferior.
543. Plectronia. Cal, turbinate, 5 -toothed, persistent, closed by 5 villous scales. Pet. 5, inserted in the throat of calyx. Berry 2-celled, 2-seeded.
544. Conocarpus. Pet. 5 or O. Seeds naked, solitary. Flowers in heads.
545. Cyphia. Cal, 5-cleft, turbinate. Petals linear, dilated at base, connivent, spreading at end. Filaments hairy, cohering. Anthers distinct. Stigma cernuous, hollow, gibbous.
546. Lightfootia. Sepals 5. Petals thin, bottom closed by stamen-bearing valves. Stigma 3-5-cleft. Caps. 3 -5-celled, 3-5-valved, $\frac{1}{8}$-superior.
547. Jasione. Flowers in heads. Common involucrum 10-leaved. Petals 5, erect. Anthers oblong, cohering at base. Stigma bifid.
548. Lagoecia, Umbel simple. Common involucre about 8-leaved, partial 4-leaved, finely pinnated. Cal. 5-cleft, with many-cut fine segments. Petals 2-fid. Seeds crowned by the calyx.
549. Hedera. Petals 5, oblong. Berry 5-seeded, surrounded by the calyx.
550. Ribes. Petals 5, and stamens inserted into the calyx. Style 2 -fid. Berry many-seeded, inferior.
551. Gronovia. Petals 5, and stamens inserted into the campanulate calyx. Berry dry, 1-seeded, inferior.

## 11. Flowers incomplcte, inferior.

552. Achyranthes. Sepals 5. Scales 5, connate at the base into a tube, at the end fringed and alternate with the stamens. Stigma 2 fid. Seed solitary, crowned by the conniving sepals.
553. Philoxerus. Sepals 5 , irregular. Stamens 5 , united at the base into a little cup shorter than the ovary. Anthers 1-celled. Style 1. Utricle 1-seeded, without valves.
554. Desmochata. Sepals 5. Stamens 5, united at base with a very small cup with neither teeth nor chaff between. Stigma capitate. Utricle 1-seeded.
555. Illecebrum. Sepals 5, vaulted at the end. Pet. O. Stigma simple or bifid. Caps. 5-valved, 1 -seeded.
556. Alternanthera. Sepals 5. Stamens 5, united into a little cup, with or without intermediate teeth, one or more of the stamens usually abortive. Anthers 1 -celled. Stigma capitate.
557. Paronychia. Cal nearly 5-parted, colored inside. Scales or petals 5, linear. Style 2-fid. Stigmas 2. Caps. 1-celled, 5 -valved.
558. Chenolea. Cal. globose, fleshy, concave. Cor. O. Filam. inserted into the base of calyx. Stigmas 2, spreading. Caps. round, depressed, 1-celled, 1 -seeded.
559. Anychia. Cal. connivent, with oblong segments, bagged at the end. Pet. O. Filam. distinct, with no setæ between. Stigmas 2, oblong. Caps, an utricle, not opening. Seed 1, reniform.
560. Arua. Sepals 5, with 2-3-bracteæ, oblong; on the outside white, hairy; inside smooth. Stamens 10 , alternately barren, inserted into a little cup at the base. Style larger, filiform. Stigma bifid.
561. Lestibudesia. Sepals 5. Stamens 5, united into a little cup without teeth. Anthers 2-celled. Ovary many-sceded. Style short or none. Stigmas 3-4, filiform, recurved. Caps. opening transversely.
562. Rhagodia. Flowers polygamous. Perianth 5-parted. Stamens 5 or fewer. Style bifid. Grain depressed, fleshy, surrounded by the perianth.
563. Deeringia. Perianth 5-parted. Stamens united at base into a small cup. Anthers 2-celled. Style 3-parted. Berry many-seeded.
564. Trianthema. Sepals oblong, colored inside. Stamens $5-10-12$, with capillary filaments. Ovary half-superior. Style 1 or 2, filiform. Stigmas simple. Caps. oblong, truncate, cut round.
565. Celosia. Sepals 3, like a 5-petalous corolla. Stam. united at base by a plaited nectary. Caps. horizontally opening. Style 2-3-cleft.
566. Gomphrena. Sepals 5, colored: outer 3 conniving, keeled. Pet. 5, rude, villous. Nect. cylindrical, 5 -toothed. Caps. cut round, 1 -seeded. Style half-bifid.
567. Mollia. Sepals 5. Pet. 5, emarginate. Style simple. Caps. 3-cornered, 1-celled, 3-valved, manyseeded.
568. Glaux. Cal. 1-leaved, colored, 5-lobed. Cor. O. Caps. 1-celled, 5-valved, 5-seeded, surrounded by a calyx.

## 12. Flowers incomplete, superior.

569. Thesium. Cal. 1-leaved, into which the stamens are inserted. Nect. inferior, 1-seeded, surrounded by the persistent calyx.
570. Heliconia. Spathes universal and partial. Cal. O. Cor. 3 petals, superior. Nect. 2-leaved. Stigma 1. Caps. 3-celled, with 1 -seeded cells.
571. Strelitzia. Spathes universal and partial. Cal. O. Cor. superior, 3 petals, the larger segments hastate. Nect. 3-leaved, surrounding the stamens. Stigmas 3. Caps. 3-celled. Cells many-sseded.

Order 2. DIGYNIA.

5 Stamens. 2 Styles.

## 1. Flowers monopetalous, inferior. Fruit a follicle or capsule. (Asclepiadere.)

572. Apocynum. Cor, campanulate. Filaments 5, alternate with the stamens. Style none. Stigma broad. Follicles long, linear.
573. Melodinus. Cal, campanulate, 5-toothed, Cor, hypocrateriform. Limb spreading, with falcate, crenulate segments. Corona 5-cleft, with short, stellate, torn divisions. Stigmas 2. Fruit a fleshy globose, 2-celled, many-seeded berry.
574. Periploca. Anthers bearded at back. Pollen-masses solitary, made up of 4 confluent ones, Stigma blunt. Follicles cylindrical, divaricating, smooth. Seed comose.
575. Cryptostegia. Cor. funnel-shaped. Tube with two included bifid scales, alternate with the divisions of the limb. Stamens included, inserted in the base of the tube. Filaments distinct. Anthers cohering with the stigma by their base. Glands 5 , spatulate. Pollen granular, simple.
576. Hemidesmus. Cor. with 5 blunt scales under the sinuses. Anthers free from the stigma, simple at end. Stigma blunt. Follicles cylindrical, much spreading, smooth. Seeds comose,
577. Secamone. Corona 5-leaved. Pollen-masses 20 , smooth, erect, fixed by fours to the point of each corpuscle of the stigma. Stigma contracted at end.
578. Microloma. Tube of cor. inflated, angular, shorter than the limb. Scales inserted into the middle of the tube below the sinuses. Anthers terminated by a membrane, sagittate. Pollen-masses compressed, pendulous. Stigma with a little point.
579. Sarcostemma. Cor. rotate. Pollen-masses pendulous. Stigma blunt. Seeds comose.
580. Dremia. Cor. rotate, with a short tube. Outer corona lo-parted, short. Pollen-masses pendulous, compressed. Stigma blunt. Seeds comose.
581. Cynanchum. Cor, rotate, 5-parted. Pollen-masses inflated. Stigma with a little point. Follicles smooth.
582. Oxystelma. Cor, spreading, rotate, with a short tube. Columna exserted. Crown 5-leaved, with compressed, acute, undivided leaflets. Pollen-masses compressed, pendulous, fixed by a narrow end. Stigma blunt. Follicles smooth. Seeds comose
583. Gymnema. Cor. 5-cleft. Scales or little teeth of the orifice 5, inserted in the sinuses. Crown none. Masses of pollen erect, fixed by the base. Follicle slender, smooth.
584. Calotropis. Cor, with an angular tube: the angles saccate inside. Crown with carinate leaflets, united lengthwise to the tube of the filaments. Pollen-masses pendulous, fixed by the narrow end. Stigma blunt.
585. Dischidia. Cor. urceolate, 5 -cleft. Corona with subulate, spreading, recurved segments. Pollenmasses erect, fixed by the base. Stigma blunt. Follicles smooth. Seeds comose.
586. Xysmalobium. Cor. 5-cleft, spreading. Corona 10 -parted in a single row : the 5 divisions next to the anthers feshy, round, simple within, the $\overline{5}$ others small. Pollen-masses pendulous, with lax connecting processes. Stigma blunt.
587. Gomphocarpus. Corona 5-leaved, the segments simple within. Pollen-masses compressed, pendulous, fixed by a fine end. Stigma depressed, blunt. Follicles ventricose, covered with innocuous spines. Seeds comose.
588. Asclepias. Corona 5-leaved, with a process on the inside. Pollen-masses fixed by a fine end. Stigma depressed, blunt.
589. Gonolobus. Cor. rotate, 5-parted. Corona shield-shaped. Anthers opening across, terminated by a membrane. Stigma fat, depressed.
590. Pergularia. Cor. hypocrateriform, with an urceolate tube. Pollen-masses erect, fixed by their base. Stigma blunt. Follicles ventricose, smooth. Seeds comose.
591. Marsdenia. Cor. urceolate, 5 -cleft, sometimes rotate. Pollen-masses erect, fixed by the base. Follicles smooth. Seeds comose.
592. Hoya. Cor. 5-cleft. Pollen-masses fixed by the base, conmiving, compressed. Stigma depressed, with an obtuse wart. Follicles smooth. Seeds comose.
593. Ceropegia. Outer corona short, 5-lobed; inner 5-leaved, with ligular undivided leaflets. Pollen-masses fixed by their base with simple edges. Stigma blunt. Follicles cylindrical, smooth. Seeds comose.
594. Stapelia. Cor. rotate, 5-cleft, fleshy. Column of fructification exserted. Pollen-masses fixed by the base. Stigma blunt. Follicles cylindrical, smooth. Seeds comose.
595. Piaranthus. Cor. fleshy. Outer corona none. Pollen-masses fixed by the base, with one edge cartila ginous, pellucid. Stigma blunt.
596. Huernia. Accessory segments of cor, tooth-like. Leaflets of the inner corona from a gibbous base subulate, undivided, alternate with the outer segments. Pollen-masses fixed by the base, with one edge cartilaginous, pellucid. Stigma blunt. Follicles cylindrical, smooth. Seeds comose.
597. Brachystelma. Cor. campanulate, with angular recesses. Column included. Crown 1-leaved, 5-cleft, with the lobes opposite the anthers, simple at back. Anthers without a membrane at the end. Pollen-masses erect, inserted by the base.
598. Caralluma. Cor. rotate, deeply 5 -cleft. Cal. of fructification exserted. Pollen-masses erect, fixed by the base with simple edges. Stigma blunt. Follicles slender, smooth. Seeds comose.

## 2. Flowers monopetalous, inferior. Fruit a capsule.

599. Swertia. Caps of 1 cell. Cor. wheel-shaped, with 2 nectariferous pores at the base of each segment.
600. Gentiana. Caps, of 1 cell. Cor. tubular at the base, destitute of nectariferous pores.
601. Hydrolea. Caps. 2-valved, 2-celled. Cor, rotate, campanulate. Stamens inserted in the tube.
602. Falkia. Cal inflated, 5-parted, 5-angular. Cor. campanulate, emarginate, crenate. Styles spreading.

Stigma globose, woolly. Seeds 4, globose, with an arillus in the bottom of the calyx.
603. Dichondra. Cal. 5-parted, with spatulate segments. Cor. short, campanulate, 5 -parted. Stigma peltate, capitate. Caps. compressed, 2celled, 2 -seeded. Seeds round.

## 3. Flowers pentapetalous, inferior.

604. Velexia. Cal. slender, 5-toothed. Cor. of 5 small petals. Caps. 1-celled, at the end 4-valved. Seeds many, attached to a filiform central receptacle.
605. Bumalda. Cal. 5-parted. Petals 5 . Styles villous. Caps. 2-celled, with 2 bractes.
606. Heuchera. Petals 5. Caps. 2-celled, with 2 bractes.
607. Cussonia. Invol. O. Cal. 1-leaved, truncated, crenated. Pet. 5, oblong, acute. Fruit twin, 2-celled, crowned by the calyx and styles.
608. Anabasis. Cal. 3-leaved. Pet. 5. Berry 1-seeded, surrounded by the calyx.
609. Salsola. Caps. closed, imbricated in the fleshy calyx. Seed with a spiral embryo.
610. Kochic. Cal. 1-leaved, campanulate, in the fruit expanding into a leafy rim resembling 5 petals. Cor.
O. Stigmas 2-3, long. Caps. 1-celled, 1-2-seeded. Seed incurved.
611. Chenopodium. Seed lenticular, truncated, superior.
612. Beta. Seed kidney-shaped, imbedided in the fleshy calyx.
613. Bosea. Cal. 5-leaved. Cor. O. Berry 1-seeded.
614. Herniaria. Caps, closed, membranous, invested with the calyx. Stam, with 5 imperfect filaments.
615. Ulmus. Caps, closed, membranous, compressed, bordered, superior.
616. Planera, Cal. membranous, subcampanulate, 4-5-cleft. Cor. O. Stigmas 2, oblong, glandular, spread-
ing. Caps. globose, membranous, 1-celled, not opening, either smooth or scaly, not winged, i-seeded. Stamens
4.6. Polygamous.
617. Flowers pentapetalous, superior.
618. Phyllis CaL 2-leaved. Pet. 5. Stigmas hispid. Seeds 2, oblong, fixed to a filiform axis.
619. Flowers pentapetalous, superior. Seeds 2. (Umbellifere.)
A. Fruit of a single or double globe.
620. Coriandrum Fruit a single or double globe, smooth, without ribs. Cal. broad, unequal. Petals radiant. Floral recept. none.

## B. Fruit beaked

619. Scandix. Beak much longer than the seeds, fruit somewhat bristly. Cal. none. Pet, unequal, undivided. Floral recept. 5-lobed, colored.
620. Anthriscus. Beak shorter than the seeds, even. Fr. rough, with scattered prominent bristles. Cal. none. Petals equal, inversely heart-shaped. Fl. recept. slightly bordered.
621. Charophyllum. Beak shorter than the seeds, angular. Fr. smooth, without ribs. Cal. none. Pet. inversely heart-shaped, rather unequal. Fl. recept. wavy.

## C. Fruit solid, prickly, without a beak.

629. Eryngium. Fr. ovate, clothed with straight bristles. Cal. pointed. Pet. oblong, equal, inflexed, undivided. FL aggregate. Common recept. scaly.
630. Sanicula. Fr. ovate, clothed with hooked bristles. Cal. acute. Pet. lanceolate inflexed, nearly equal. F1, separated, dissimilar.
631. Echinophora. Fr. ovate, imbedded in the enlarged armed receptacle. Seed solitary. Cak. spinous. Pet. inversely heart-shaped, unequal. FL separated.
632. Daucus. Fr. elliptic oblong, compressed transversely. Seeds with four rows of flat prickles, and rough intermediate ribs. Cal. obsolete. Pet. inversely heart-shaped, unequal. Fl. separated.
633. Caucalis. Fr. elliptic oblong, compressed transversely. Seed with 4 rows of ascending, awl-shaped, hooked prickles, the interstices prickly or rough. Cal. grooved, acute, unequal. Pet. inversely heart-shaped, unequal. Fl. imperfect, separated.
634. Torilis. Fr. ovate, slightly compressed laterally. Seeds villous, rough, with scattered prominent,
ascending, rigid prickles. Cal. short, broad, acute, nearly equal. Pet. inversely heart-shaped, nearly equal. Fl. united,
635. Oliveria. Leaflets of the involucres 3-parted. Umbels fascicled, as long as the involucres. Petals split to the base. Fr. ovate, hispid, with three streaks.
636. Ledeburia. Involucres O. Fr. ovate, with spreading bristles. Bases of styles 2, conical, connate at base. Styles persistent.
637. Myrrkis. Fr, deeply furrowed. Cal. none. Pet. inversely heart-shaped, rather unequal. Fl. recept. none. Flowers imperfectly separated.
638. Bunium. Fr. slightly ribbed. Cal. small, acute, unequal. Pet. inversely heart-shaped, equal. Fl, recept. none. Flowers imperfectly separated.

## D. Fruit solid, nearly round, unarmed, without wings.

632. Enanthe. Fr. ribbed, somewhat spongy. Cal. large, lanceolate, acute, spreading, unequal. Pet. inversely heart-shaped, very unequal. Fl. recept. dilated, depressed. Fl. separated.
633. Crithmum. Fr. ribbed, coriaceous. Cal. small, broad, acute, incurved. Pet. elliptical, acute, incurved, equal. Fl. recept none. Fl. united, all perfect.
634. Athamanta. Fr. ribbed, ovate, hairy, Styles short. Cal. lanceolate, acute, incurved. Pet. inversely heart-shaped, broadly-pointed, equal, Fl, recept. none. Fl imperfectly separated.
635. Pimpinella. Fr. ovate, ribbed, with convex interstices. Styles capillary, as long as fruit. Cal. none. Pet. inversely heart-shaped, nearly equal. Fl. recept. none. Fl. either united or diœcious.
636. Phellandrium. Flowers fertile. Fruit crowned. Fruit ovate, smooth, crowned by the calyx and styles, Involucres partial, not universal.
637. Dondia. Umbels capitate. Involucre 6-leaved, longer than umbel Petals entire. Fruit ovate, solid, with 4 ribs, and convex intervals.
638. Trachyspermum. Leaves of involucre pinnatifid. Fruit striated, with 5 muricated ribs. Rudiments of calyx 5. Fl. receptacle conical. Style withering.
639. Ammi. Involucre pinnate or pinnatifid. Fruit oblong, with 5 obtuse ribs, and convex intervals.
640. Bubon. Involucres O. Fruit ovate, solid, hispid, or villous, with 5 ribs, and broadish bands of the intervals and raphe.
641. Cuminum. Involucres 5-leaved. Fruit ovate, prismatic, smoothish, bladdery, with 7 ribs, and bearded intervals.
642. Seseli. Common involucre O; partial 5-leaved, sometimes 1-leaved. Fruit ovate, solid, with 5 acute ribs, and furrowed, striated intervals.
643. Thapsia. Fruit narrow, but little compressed, scarcely ribbed, with 2 dorsal and marginal wings.
644. Actinotus. Umbel capitate. Involucre woolly, very large. Cor. O. Cal. 5 sepals. Male fowers mixed with hermaphrodite. Fruit ovate, villous, with 5 stripes, crowned by the calyx.
645. Trinia. Flowers dicecious. Involucre few-leaved. Pet. ovate, lanceolate. Seeds roundish, with 5 ribs, with the intervals once-banded.
E. Fruit solid, unarmed, without wings, compressed laterally, the diameter of its juncture being at least twice as narrow as the opposite diameter.
646. Sium. Fr. ovate or orbicular, ribbed, furrowed. Cal. small, acute, unequal, or obsolete. Pet, inversely heart-shaped or obovate, equal. Styles cylindrical, shorter than the petals. Fl. receptacle none. Fl. uniform, united.
647. Sison. Fr. ovate or nearly orbicular, ribbed. Cal. obsolete or blunt. Pet. elliptical or inversely heart. shaped, with an involute point, equal. Styles very short and thick. Fl. recept. none. Fl. uniform, united,
648. Cicuta. Fr. nearly orbicular, heart-shaped at the base, with 6 double ribs. Cal. broad, acute, rather unequal. Pet. ovate or slightly heart shaped, nearly equal. Style scarcely tumid at the base. Fl, recept. depressed, withering. FL uniform, nearly regular, united.
649. Conium. Fr ovate, with 10 acute ribs, wavy in an unripe state. Cal. obsolete. Pet inversely heartshaped, slightly unequal. Styles a little tumid at the base. Fl. recept. dilated, depressed, wavy, permanent. Fl. slightly irregular, united.
650. Smyrnium. Fr. broader than long, concave at each side, with 6 acute dorsal ribs ; interstices convex. Cal. very small, acute. Pet. equal, lanceolate, incurved or inversely heart-shaped. Styles tumid and depressed at the base. Fl. recept. none. El. nearly regular, partly barren or abortive.
651. Apium. Fr. roundish, ovate, with 6 acute dorsal ribs ; interstices flat. Pet. roundish, with an inflexed point, very nearly equal. Styles greatly swelled at the base. Fl. recept. thin, orbicular, wavy. Fl, nearly regular, united
652. Ægopodium. Fr. elliptic-oblong, with equidistant ribs; interstices flattish. Cal. none. Pet. inversely heart-shaped, broad, a little unequal. Style ovate at the base. Fl. recept. none. F1. united, all perfect, slightly radiate.
653. Meum. Fr. elliptic, oblong, with equidistant ribs; interstices flatish. Cal. none. Pet. obovate, with an inflexed point, equal. Styles tumid at the base, short, recurved. Fl recept. none. Fl. united, all perfect, regular.
654. Anethum. Invol. none. Pet. involute, yellow. Seeds compressed, with 3 ribs; intervals once-banded.
655. Carum. Fr. elliptic, oblong, with equidistant ribs; interstices convex. Cal. minute, acute, often obsolete. Pet. inversely heart-shaped, unequal. Styles tumid at the base, subsequently elongated, widely spreading. Fl. recept. angular, thin, wavy, permanent. Fl. separated, irregular.
656. Cnidium. Fr. ovate, acute, with equidistant sharp ribs; interstices deep, concave; juncture contracted. Cal. none. Pet. equal, obovate or inversely heart-shaped. Styles hemispherical at the base ; subsequently elongated, spreading, cylindrical. Fl. recept. annular, thin, undulated, erect, afterwards depressed. Flower imperfectly separated, nearly regular.
657. Bupleurum. Fr, ovate-oblong, obtuse, with prominent, acute, abrupt ribs; interstices flat; juncture
contracted. Cal none. Pet. equal, broadish, wedge-shaped, very short, involute. Styles very short, not extending beyond the circumference of their broad tumid bases. Fl. recept. none. Fl. all perfect and regular.
658. Hydrocotyle. Fl. nearly orbicular, rather broader than long, angular, much compressed, juncture very narrow. Cal. none. Pet. equal, ovate, spreading, undivided. Styles cylindrical, shorter than the stamens, tu-
mid at the base. Fl. recept. none. Fl mid at the base. Fl. recept. none. Fl. all perfect and regular.
659. Spananthe. Umbel simple, with few rays. Involucre few-leaved. Fruit ovate, solid, smooth, with the juncture and sides contracted, and 5 ribs at the back.
660. Ulospermum. Involucre few-leaved. Germen oblong. Ribs of fruit membranous, wavy, curled. Calyx scarcely any. Fl. receptacle flattened. Styles withering.

## F. Fruit solid, unarmed, compressed transversely, the diameter of the juncture being much greater than the opposite diameter.

661. Fthusa. Seeds ovate, convex, with 5 tumid, rounded, acutely keeled ribs; interstices deep, acute, angular; border none. Cal. pointed, very minute. Pet. inversely heart-shaped, rather angular. Fl. recept. none. Fl. all perfect, slightly radiant.
662. Imperatoria. Seeds obicular, with a notch at each end, a little convex, with 3 prominent dorsal ribs, and a dilated, flat, even border. Cal, none. Pet. inversely heart-shaped, very slightly irregular. Fl, recept none. Fl. all perfect, scarcely radiant.
663. Selinum. Scales elliptical, slightly convex, with 3 acute dorsal ribs, and a dilated, flat, even border. Cal minute, pointed, spreading. Pet. inversely heart-shaped, involute, equal. Fl. recept. obsolete. Fl. per. fect, regular, a few occasionally abortive.
664. Angelica. Seeds elliptic-oblong, convex, with 8 dorsal wings, and a narrow, flat, even border. Cal. none. Pet. lanceolate, flattish, undivided, contracted at each end, equal. Fl. recept. thin, wavy, narrow, permanent. Fl. all perfect,
665. Ligusticum. Seeds oblong convex, with 3 dorsal and 2 marginal equal wings. Cal. small, pointed, erect, broad at the base. Pet. elliptical, flattish, undivided, contracted at each end, equal. Fl. recept. none. Fl. all perfect, regular.
666. Hasselquistia. Involucres various, Flowers radiant. Fruit compressed at edge, flat, roundish. Bark turgid in the circumference with 5 obtuse ribs. Fruit in the middle of the umbel deformed, navicular, torn at edge, with 3 stripes at back.
$60 \%$. Artedia. Fruit oblong, compressed, with the marginal wings sinuated, 5 dorsal ribs, and scaly juncture. Flowers radiant. Involucres pinnatifid.
667. Ferula. Fruit compressed, flat, thickened at edge, with 3 obtuse dorsal ribs, and banded intervals and iuncture. Flowers polygamous Involucres various.
668. Laserpitium. Fruit oval, somewhat compressed, with the 3 principal ribs acute, the secondarv winged. Involucres many-leaved.

## G. Fruit thin and almost flat, compressed transversely, without dorsal wings.

670. Peucedanum. Seeds broadly elliptical, with a notch at each end, a little convex, with 3 slightly prominent ribs, interstices striated, border narrow, flat, even, smooth, and entire. Cal. pointed, ascending. Pet. inversely heart-shaped, all very nearly equal. Fl, recept. none. Flowers regular, imperfectly separated.
671. Pastinaca. Seeds elliptic-obovate, with a slight notch at the summit, very nearly flat, with 3 dorsal ribs and 2 marginal ones; border narrow, flat, thin, even, smooth, and entire. Cal. very minute, obsolete. Pet. broadly lanceolate, involute, equal. Fl. recept. broad, orbicular, wavy, rather thin, concealing the calyx. Fl. regular, uniform, perfect.
672. Heracleum. Seeds inversely heart-shaped, with a notch at the summit, very nearly flat, with 3 slender dorsal ribs, 2 distant marginal ones, and 4 intermediate, colored, depressed, abrupt lines from the top; border narrow, slightly tumid, smooth, even, and entire. Cal. of 5 small, acute, evanescent teeth. Pet, inversely heart-shaped, radiant. Fl. recept, wavy, crenate, obtuse. Fl. separated.
673. Tordylium. Seeds orbicular, nearly flat, roughish, without ribs; border tumid, wrinkled or crenate, naked or bristly. Cal. of 5 awl-shaped unequal teeth. Pet. inversely heart-shaped, radiant, variously unequal and irregular. Fl. recept. none. Fl. separated.
674. Astrantia. Umbels fascicled. Involucres as long as umbels. Fruit oblong, surrounded by furrowed, wrinkled, little bladders.
675. Zosimia. Both involucres many-leaved. Petals obcordate, with the little segment involute, acute Fruit compressed, villous, thickened at edge, at the back with 4 bands, which are joint $d$ and conniving.

## H. Fruit with a coarse, corky, or spongy bark.

676. Rumia. Partial involucre, 3-8-leaved. Cal. 5-toothed. Petals ovate, incurved, with a sh urt crenulate segment. Seeds ovate, fleshy, rugose, scaly.
677. Cachrys. No involucre. Cal. O. Petals ovate, lanceolate, acute. Seed obovate, oblong, rounded, smooth, fungous.
678. Hippomarathrum. Fruit with scaly, rough ribs, covered with a thick bark.

Order 3. TRIGYNIA.

5 Stamens. 3 Styles.

## 1. Flowers superior.

679. Viburnum.

Cor. 5-cleft. Berry with 1 seed.
680. Sambucus. Cor. 5 -cleft. Berry with 3 seeds.

## 2. Flowers inferior.

681. Rhus. Cal, 5-parted Petals 5. Berry 1 -seeded.
682. Cassine. Cal 5-parted. Petals 6. Berry S-seeded.
683. Spathelia. Cal. 5-leaved, Petals 5. Caps. 3-angular, 3-celled, Seeds solitary.
684. Staphylea. Petals 5. Caps. 2 or 3, inflated,
685. Tamarix. Pet. 5. Caps, of 3 valves. Seeds numerous, feathered.
686. Turnera. Cal. 5-cleft, infundibuliform; the outer 2-leaved. Petals 5, inserted in the calyx. Stigmas many-cleft. Caps. 1-celled, 3-valved.
687. Drypis. Cal. 5-toothed. Petals 5. Caps, cut round, 1-seeded.
688. Alsine. Cal. 5-leaved. Pet. 5 equal, Caps, superior, 1-celled, 3-valved, many-seeded. Receptacle central, free.
689. Telephium. Cal. 5-leaved. Petals 5, inserted in the receptacle. Caps, 1-celled, 3-valved.
690. Corrigiola. Pet. 5. Seed 1, naked, triangular.
691. Pharnaceum. Cal. 5-leaved. Cor. O. Caps. 3-celled, many-seeded.
692. Portulacaria. Cal. 2-leaved. Petals 5. Seed 1, winged, 3-cornered.
693. Basella. Cal. O. Cor. 7-cleft; at length berried, with the two opposite segments larger than the rest.

Order 4. TETRAGYNIA.

5 Stamens. 4 Styles.
694. Parnassia. Nectaries fringed with bristles bearing globes. Caps. of 4 valves.
695. Evolvulus. Cal, 5-leaved. Cor, rotate, campanulate, with emarginate lobes. Styles 2, deeply bifid. Stigma simple. Caps. 2-celled, 4-valved, 4-seeded. Seeds 2.

Order 5. PENTAGYN1A. $\qquad$ 5 Stamens. 5 Styles.

## 1. Flowers superior.

696. Aralia. Involucre very small. Umbels globose. Cal. very small, 5-toothed. Petals 5 , ovate, oblong, spreading, or reflexed. Stigmas nearly round, 5-10. Berry roundish, crowned, 5-seeded. Seeds hard, oblong. 697. Actinophyllum. Cal. an entire rim. Cor. calyptrate, jumping off. Stam. 5-6-8-9. Styles 4-7. Berry with 7 angles and 7 cells. Seeds solitary, bony. Flowers clustered.

## 2. Flowers inferior.

698. Rochca. Cal. 5-parted. Cor, funnel-shaped, 5-cleft. Scales 5, at base of ovary. Caps. 5.
699. Crassula. Cal. 5-leaved, Pet. 5. Scales 5, nectariferous at base of ovary. Caps. 5.
700. Gisekia. Cal. 5-leaved. Cor. O. Caps. 5, close together, roundish, 1 -seeded.
701. Linum. Pet. 5. Capsule of 10 cells.
702. Drosera. Pet. 5, Caps. of 3 valves, with many seeds.
703. Commersonia. Cal. 1-leaved, bearing the cor. Petals 5. Nectary 5-parted. Caps. 5-celled, echinate. 704. Rulingia. Petals 5, with a cucullate base. Sterile stamens 5, undivided. Ovary 5-celled. Caps. with double septa.
704. Armeria. Cal. 2-leaved, entire, plaited, scarious. Petals 5. Seed 1, superior. Flowers in heads, with a common many-leaved involucrum.
705. Statice. Cal, 2-leaved, entire, plaited, scarious. Petals 5. Seeds 1, superior. Flowers scattered in a panicled or spiked scape.

IIistory, Use, Propagation, Culture,
322. Mirabilis, is a Latin word, signifying something wonderful or admirable; and applied with some reason to this, the most fragrant of flowers. Clusius called it Admirabilis. We from the same cause call it Marvel of Peru. The French botanists still call the genus by Van Royen's name, Nyctago; derived from vu弓, night, and ago, to act, on account of the flowers expanding at night. M. dichotoma is called the four-o'clock flower in the West Indies, from the flowers opening regularly at that time of the afternoon. M. jalapa is a very ornamental plant in warm borders. When cultivated, it sports into many agreeable varieties. It fowers best when treated as a tender annual, and then planted out; but if sown at once in the open air, it will flower late in the season in favorable summers. Its large tuberous roots, if taken up and preserved during winter like those of Dahlia, or even covered well with litter in the open garden, will flower perennially. The powder of these roots washed, scraped, and dried, is one of the substances which form the jalap of druggists.
323. Abronia. Derived from $\propto \beta \rho \circ 5$, delicate. The little plant produces flowers surrounded by an involucrum of a charming rose color.
324. Plumbago. Pliny says this plant was so called from plumbum, because it possessed the potver of curing a disorder in the eyes called by that name, which appears to have been the same as what we call cataract. There

Order 6. POLYGYN1A.

5 Stamens. Many styles.
707. Myosurus. Pet. 5, with tubular honey-bearing claws. Seeds naked. Cal. spurred at the base.
708. Ceratocephalus. Cal. 5-leaved, persistent. Petals 5, with a honey pore at base covered by a scale. Seeds several, naked, attached to a bearded receptacle.
709. Xanthorhiza. Cal. O. Petals 5. Nectaries 5, stalked. Caps. 5, 1 -seeded.
710. Sibbaldia. Cal. 10 -cleft. Petals 5 , inserted in the calyx. Styles from the side of the ovary. Sceds 5 .

## MONOGYNIA.

1855 Flowers sessile erect axillary solitary
1856 Flowers clustered stalked, Leaves smooth

1857 Flowers clustered somewhat stalked, Tube of cor. 4 times as long as limb, Leaves cordate smooth 1858 Flowers clustered sessile, Leaves pubescent

1859 The only species, resembling Primula farinosa. Very beautiful
1860 Leaves stem-clasping lanceolate rough, Stem erect
1861 Leaves stalked ovate smooth, Stem filiform
1862 Leaves stalked ovate smooth somewhat toothed, Stem with swollen Jounts
1863 Leaves stalked ovate smooth, Stem flexuose climbing
1804 Leaves obovate retuse smooth
1865 Leaves stalked oblong entire glaucous beneath, Stem erect
1866 Leaves stem-clasping lanceolate smooth, Stem divaricating
1867 Leaves lanceolate ovate, Stem shrubby, Spikes numerous aggregate corymbose
1868 Leaves oblong lanceolate, Stem shrubby, Spikes terminal aggregate corymbose, Sepals long subulate
1869 Leaves ovate rugose scabrous opposite and alternate, Spikes in pairs
1870 Leaves ovate entire tomentose rugose, Spikes in pairs
1871 Leaves stalked oblong obtuse entire rough with scattered hairs
1872 Leaves lanceolate glaucous smooth obsoletely veined opposite and alternate, Spikes in pairs
1873 Leaves linear lanceolate glaucous smooth opposite and alternate, Spikes in pairs or compound
1874 Leaves ovate lanceolate villous, Spikes solitary lateral stalked
1875 Leaves cordate ovate subserrate rugose, Spikes terminal simple solitary, Stem herbaceous
1876 Leaves ovate entire tomentose plaited, Spikes solitary and in pairs
1877 Cal. 5-toothed smoothish, Teeth nearly equal obtuse as long as the tube of cor. Leaves lanceolate obtuse smooth, Limb of cor. more than twice as long as cal.
1878 Stem hairy, Calyx with dense spreading hairs hooked at the end
1879 Seeds smoothish sawed at edge, Stem simple few-flowered and oblong, Leaves villous
1880 Stem nearly sim. with lanc. nearly acute somew. repand lvs. hispid, Sp. in pairs somew. corym. Cal. very obt.
1881 Seeds naked, Radical leaves stalked, Racemes without bracteæ, Hairs of calyx spreading.
1882 Stem diffuse, Branches and flower-stalks much shorter than cal. Leaves oblong ovate obtuse upright
1883 Cal, spreading 5 -parted, Segments unequal acute, Hairs long downy

and Miscellaneous Particulars.
is also a modern reason for the application of the name to this genus. P. europæa is called toothwort, and dentelaire, Fr., from its curing the tooth-ach, for which purpose the bruised root is chewed, when it excites by its causticity a healthy salivation, but stains the teeth of a lead color. The species are all pretty, easily cultivated, and almost always in flower.
325. Heliotropium. From $\dot{\eta} \lambda 105$, the sun, and $\tau \varrho \in \pi \omega$, to turn. Both Pliny and Dioscorides assert that the flowers are always turned towards the sun. It was called Verrucaria by the Latins, because the juice of the leaves mixed with salt was said to be excellent in removing warts, verrucre. H. peruvianum and europæum are popular plants, with the smell of new hay: the former is rather tender; but both keep flowering during most of the summer months. Curtis recommends keeping $\mathbf{H}$. peruvianum in a stove during winter.
326. Myosotis. So named from $\mu v s$, a rat, and zs, óros, an ear. Its oval velvety leaves are like the ear of a rat or mouse. M. scorpioides, Forget-me-not, has its specific name from the racemes of flowers, which, when young, bend in at the top like a scorpion's tail. It is a well known sentimental flower, will grow any where, and varies more than most plants with situation. On dry walls and rubbish, it is dwarfish, rough, and hairy, not rising when in flower more than two or three inches; in muddy ditches it is smooth all over, of a shining light

History, Use, Propagation, Culture,
green, and two or three fect high. In common soils, as in a garden or loamy corn-field, it assumes an intermediate character. Linnæus considers the plant as deadly to sheep. In gardens it does well in pots in the shade, or treated as a bog-plant, than which few better deserve the name of pretty.
327. Echinospermum. Named by Lehmann from $\varepsilon \chi^{i v o s}$, a hedgehog, and $\sigma \pi \varepsilon \rho \mu$, , seed, the seeds being very prickly, by which character, and their being compressed, not depressed, and the bracteæ of the inflorescence, the genus is principally distinguished from Myosotis and Cynoglossum.
328. Mattia. A genus divided by Professor Schultes from Cynoglossum, with which it agrees in gencral character. Named after some unknown botanist.
329. Tiaridium. From rooga, an episcopal head-dress, and $\varepsilon$, $\delta o s$, similar ; on account of the resemblance between its seeds and a mitre. Three species have been described, of which one is the H. indicum of Linn., a plant of no beauty or merit.
330. Lithospermum. From $\lambda . \operatorname{Aos}$, a stone, and $\sigma \pi \varepsilon \rho, \ldots$, seed, the seeds being hard and shining, like little pebbles. L. officinale has stony, brittle, egg-shaped nuts, exquisitely polished, grey or yellowish; and being considered like a stone, were for that reason used as a cure for the disease so named. The bark of L arvense abounds with a deep red dye, which stains paper, linen, \&c. and is easily communicated to only substances, like the alkantet root, and hence is called bastard alkanet. The country girls in the north of Sweden stain their faces with the root on days of festivity.

1884 Stem nearly simple hispld, Leaves lanc. acute hairy ciliated at base, Cal. very spreading 1885 Stem branched diffuse, Lvs. lanc. acute hispid, Racemes simple elongated, Flow, very remote, Cal acute 1886 Stem branched, Leaves obovate obtuse mucr. Fl.-stalks in fruit much spreading thickened under calyx

1887 Seeds all over prickly, Leaves ovate oblong, Racemes divaricating
1888 Seeds with a double row of marg. prickles, Lvs. lanc. with incumb. hairs, Limb of cor. camp. longer than cal.
1889 Seeds with a single row of marginal prickles, Leaves obl. obtuse with spreading hairs, Cal. as long as cor. 1890 Seeds with a doub. row of very short mar. prickl. Lvs. lanc. with incum. hairs, Cor. twice as long as cal, with a flat limb

1891 Stam, as long as cor. Segments of cor. obtuse, Racemes terminal umbelled, Leaves hoary 1892 Cal. woolly, Limb of cor. acute deeply 5 -cleft, Racemes cernuous

1893 Stem herbaceous crect hairy, Leaves ovate cordate acute hairy, Tube of cor. twice as long as calyx
1894 Seeds smooth, Cor. scarcely longer than calyx, Leaves lanceolate acute veiny
1895 Leaves lanceolate linear strigose, Cal. the length of cor. spreading in fruit
1896 Leaves linear lanceolate acute, Spikes terminal 1-sided, Bractes lanceolate, Seeds muricated
1897 Seeds smooth, Cor. much longer than cal. Leaves lanceolate acute at each end, Stem herbaceous
1898 Leaves linear hispid revolute at edge, Stamens as long as corolla
1899 Seeds smooth, Cor. twice as long as cal. Lvs. obl. lanc. acute, Spikes leafy distichous term. and axillary
1900 Leaves linear lanceolate strigose, Cal. as long as tube of cor, in fruit conniving
1901 Seeds smooth, Cal. spreading incurved, Leaves linear
1902 Flower branches lateral, Bractes cordate stem-clasping
1903 Stem nearly simple villous, Leaves oblong obtuse hoary, Tube of cor. twice as long as calyx
1904 Hairy, Floral leaves ovate, Cal. Iong lanceolate
1905 Silky, Leaves linear, Cal. long linear, Corolla crenate, Tube long
1906 Hirsute, Hairs prost. scattered, Fl.-stems simp. aggregate, Lvs. lin. acute, Anthers shorter than filaments 1907 Flowers ventricose, Fruit erect, Leaves lanceolate hispid, Hairs stellulate
1908 Flowers cylindrical acute, Fruit pendulous, Leaves linear hairy
1909 Hispid, Hairs erect scattered, Stem branched, Leaves lanceolate, Anthers as long as filaments
1910 Silky, Hairs prostrate very minute, Stems branched, Leaves spatulate, Anthers as long as filaments
1911 Flowers clavate cylindrical, Leaves oblique the lower lanceolate obtuse, Fruit erect, Seeds smooth 1912 Stem simple leafy, Leaves linear lanceolate very long acute 3-nerved above hispid beneath closely hairy

1913 Leaves lanceolate strigose entire, Panic. dichotomous divar. Flower stalked, Cal. 5-parted subulate 1914 Leaves lanceolate callous villous, Racemes trichotomous
1915 Leaves lanceolate strigose, Spikes 1-sided imbricated, Cal. as long as tube of corolla
1916 Leaves linear-lanceolate coarsely dotted hispid, Calyx in fruit camp. nodding
1917 Racemes nearly naked in pairs
1918 Leaves oblong entire narrowed at both ends with the simple stem hispid, Peduncles trifid
1919 Leaves linear lanceolate villous, Racemes alternate
1920 Strigose, Leaves linear toothed, Stalks less than bracteæ, Cal. in fruit inflated
1921 Leaves oblong, Bractes longer than the 5-parted calyx, Valves of corol. shorter than stamens
1922 Leaves ovate strigose, Racemes somewhat capitate in pairs leafy, 2-leaved at base, Cal. 5-cleft
1923 Leaves obl. toothed hispid the lower stalked the upper sessile, Flowers single lateral, Stems diffuse

and Miscellaneous Particulars.
331. Batschia. Named in honor of John George Batsch, a German professor of botany in the university of Jena, in the latter part of the last century. His works upon Fungi are still quoted. The three species known are natives of North America, and are very pretty plants.
332. Onosma. An ancient name, the origin of which, from ovos, an ass, and oo $\mu \mathrm{m}$, smell, as being a plant with flowers grateful in their smell to asses, is not very certain. What was intended by Pliny and Dioscorides as Onosma has not been satisfactorily ascertained. It was undoubtedly a plant of this family. This genus in its wild state is found chiefly on rocks; and, like most temporary rock-plants, is not easily preserved otherwise than on dry walls, heaps of rubbish, or artificial rock-work. The species are pretty, and all have yellow flowers.
333. Anchusa. Derived from arzovo $\alpha$, paint. In early times, the root of A. tinctoria was used for staining the features when more delicate colors were unknown. The English name Bugloss has been formed from $\beta$ \&s, an ox, and $\nu \lambda \omega \sigma \sigma \alpha$, a tongue, in allusion to the long rough leaves. A. officinalis is nearly allied in qualities to Borago. The tube of the corolla is melliferous, and very attractive to bees; the leaves are juicy, and the roots mucilaginous, and used in China for promoting the eruption of the small-pox. A. tinctoria is cultivated in the south of France for the roots, which communicate a fine deep red to oils, wax, and all unctuous substances, as well as to spirits of wine. It is used chiefly by the apothecaries for coloring plaisters, lip-salves, \&c. and by vintners for staining the corks of their port wine bottles, or for coloring and favoring the spurious compounds sold as port wine.

History, Use, Propagatzon, Culture,
334. Symphyitum. Named from $\sigma \nu \mu \varphi \sigma_{15}$, a union or junction, the plant having for a long time passed for a famous vulnerary. The French name for the plant, Consoude, has the same meaning ; but that of the English term Comfrey is obscure. S. officinale abounds in mucilage, and may be substituted for Althæa officinalis. All the species are large, coarse, but showy shrubbery plants, flowering for two or three months together, and S. asperrimum the whole season.
335. Onosmodium. From Onosma and ados, similar to Onosma; from which it is not very different either in habit or characters.
335. Cynoglossum. From zuwy zuyos, a dog, and $\gamma \lambda \omega \sigma \sigma \alpha$, a tongue. Its long soft leaves have been compared to the tongue of a dog. C. officinale smells like mice, was considered anti-scrophulous, and is disliked by cattle.
337. Omphalodes. From ouqciss, a navel, and $\varepsilon \delta \delta s$, resemblance; the round seeds, which are depressed in the centre, may be compared to a little navel; for the same cause it is called Navelwort in English. O. linifolia is a common border annual. O. verna is a beautiful little plant with blue flowers, like the Forget-me-not, peeping from among the snow in every cottager's garden in the early spring.
338. Pulmoniria. Derives itst name, some say, from the speckled appearance of the leaves resembling diseased lungs : but others think that its name has arisen from the plant having been used with success in pulmonary complaints; whence also, perhaps, the English name Lungwort. It must not, however, be inferred from

## 1924 Leaves ovate lanceolate decurrent

1925 Leaves ovate oblong narrowed at base the lower stalked, Segments of fower very short obtuse
1926 Leaves ovate obl. narr, at base hairy the lower stalked the for. opp. sess. Cal, spread. Segm, of f. acute
1927 Leaves cordate ovate hairy stalked the floral opp. sess. Segments of fower obtuse, Stem branched
1928 Lvs. cord, ovate or lanc. acumin. stalked very rough, Stem muric. with reversed bristles, Limb of fl. campz,
1929 Leaves cordate ovate acuminate hairy, floral sessile nearly opposite, Stem simple
1930 Hispid, Leaves oval lanceolate acute papillose, Segments of cor. very acute
1931 Hoary, Leaves oblong about 3-nerved, Segments of cor. oval
1932 Leaves broad lanceolate wavy hoary on each side sessile close together, Seeds warted
1933 Leaves spatulate lanceolate shining nearly naked scabrous beneath
1934 Leaves lanceolate tomentose the upper obovate lanceolate cordate stem-clasping, Sepals ovate
1935 Very hairy, Leaves oval the upper stem-clasping, Corymb. terminal leafless on a long stalk
1936 Leaves villous, Cal, hairy, Stamens longer than corolla
1937 Stamens longer than corolla, Cal. villous, Radical leaves ovate stalked very large
1938 Leaves lanceolate villous, Seeds with hooked prickles
1939 Leaves spatulate obtuse, Flowers heaped
1940 Radical leaves ovate cordate, Cauline ovate stalked, Shoots creeping
1941 Leaves linear lanceolate smooth roughish with little teeth at the edge, Seeds urceolate rugose 1942 Leaves obl. lanc. nerved smooth and shining above pubesc. beneath the lower on long stalks the upper sess:

1943 Cal. length of the tube of the cor. Leaves oblong lanceolate the radical sessile cauline stalked
1944 Cal. length of the tube of the cor. Radical leaves ovate cordate scabrous cauline ovate sessile
1945 Cal. short 5-parted hispid, Radical lvs. ovate cordate stalked, cauline half stem-clasping, Flowers panicled
1946 Cal. short 5-parted hispid, Leaves ovate oblong acuminate hairy
1947 Smooth erect, Radical leaves on long stalks lanceolate, cauline linear oblong, Flowers panicled, Cal. short
1948 Cal, much shorter than tube of cor, which is longer than limb, Radical leaves ovate elliptical cauline ob1949 Cal. short, Rad. leaves cordate
[ovate lanceolate obtuse
1950 Smooth, Leaves ovate glaucous fleshy, Stem branching procumbent
1951 Leaves ovate lanceolate acuminate downy decurrent radical stalked, Cal, longer than tube
1952 Leaves hispid radical obl. lanc. acuminate narr. into the stalk, Cauline decurrent, Cor. campanulate
1953 Cor, obtuse spreading ventricose campanulate at end, Stamens shorter than corolla, Leaves smooth
1954 Cor, obtuse spreading cylindrical, Stamens as long as cor. Leaves rough
1955 Leaves stem-clasping entire, Cor. acute closed whole colored, Segm. of cal. unequal
1956 Leaves stem-clasping entire, Cor, acute closed with a red band in middle, Seg. of cal. uneq. Stems many
1957 Leaves ovate the lower stalked all alternate, Cal. spreading, Pedunc, terminal many-flowered
1958 Leaves cordate stalked, Pedunc. many-flowered, Stamens exserted villous
1959 Leaves alternate oblong sessile, Pedunc. axillary 1-flowered, Cor. campanulate nodding 1960 Glaucous, Stem smooth, Leaves decurrent rough above, Segments of cor. lin. lanc. spreading unequal

1961 Leaves of stem and branches lanc. half stem-clasping, Pedunc. 1-flowered, Sepals auriculated at base
1962 Leaves opposite stalked ovate, Pedunc. many-flowered, Sepals ovate acute erect
1963 Sepals not auriculated. Nuts smooth without an edge, Leaves sessile attenuated at the base

and Miscellaneous Particulars.
Inglish names of this sort having been applied to plants, either that lungwort was ever used in this country for the lungs, or liverwort for the liver. The truth is, that the old herbalists, or translators of the classical writers upon natural history, made English names after their Latin denominations, without enquiring whether such continued to be applicable or not, and their less informed successors had no difficulty in finding those virtues in the plants which were indicated by the names of the translators. P. virginica, sibirica, and maritima are elegant plants, greatly resembling each other, and considered by some as most probably only varieties. They are among the most elegant ornaments of the flower-garden in dry springs; but they require some care in keeping, unless in a soil almost entirely of sand.
339. Cerinthe. From zeneos, wax, and oveNos, fower, because there is great attraction for bees in the flowers. The French word melinet and the English honeywort have been formed in the same sense. C. major is a shewy border annual, much frequented by bees. In Italy and Sicily it is very common, and a biennial.
340. Borago, is said by Apuleius to be an alteration of corago, and to have been named on account of its cordial qualities. Pliny says that wine, with this infused in it, cheers the spirits. B officinalis was formerly in great repute as a cordial. According to Withering, the young leaves may be used as a salad or as a pot-herb, and the flowers form an ingredient in cool tankards.

History, Use, Propagation, Culture,
the principal feature in the generic character. This has been separated from Borago by modern botanists ; it is a plant of no beauty.
342. Asperugo. So called from its asncrity. The only species is a procumbent annual with small blue flow. ers, found all over Europe, from Lapland to the Mediterranean.
343. Nonea. A name contrived by Mönch, in his Methodus Plantarum, to distinguish the dark flowered species of Lycopsis. The genus was long neglected, but has recently been adopted by both Decandolle and Lehmann.

344, Lycopsis. From $\lambda u \approx 05$, a wolf, and $0 \%$, the eye. Ingenious people have found a similarity between the small blue flowers of this plant and the eye of a wolf. Au the species are weed-like plants.
345. Echium, is an ancient name applied to some plant of this family, and derived from exis, a viper, from the resemblance between its seeds and the head of a viper. The spotted stem, which may be likened to a snake's skin, affords a reason for the application of the name. All the species are beautiful in their flowers, but rough and unpleasant in their foliage. The common E. vulgare of our downs is perhaps the handsomest of European plants.

1964 The only species. Stem climbing very rough, Flowers small axillary

1965 Leaves entire, Stem erect, Cal. of fruit inflated pendulous
1966 Leaves obl. lanc. strigose floral cordate longer than the cal. Cal. acute, in fruit inflated pendulous
1967 Cal. 5-cleft, in fruit inflated pendulous, Leaves obl. hispid floral cordate longer than cal. Stems procumb.
1968 Stem procumbent, Leaves entire, Cal. of fruit pendulous, Cor. shorter than calyx
1969 Leaves lanceolate, Stem prostrate, Cal. of fruit inflated nodding 10-angular, Cor. longer than calyx
1970 Leaves lanceolate denticulated hispid ciliated, Cal, of fruit inflated pendulous
1971 Leaves repand toothed callous, Stem decumbent, Corollas nodding
1972 Leaves lanceolate hispid, Cal. always erect
1973 Leaves ovate entire scabrous, Cal. erect

1974 Pubescent, Fl. in loose corymb. Pan. at end of branches, Tube closed by a 5-lobed fringe, Stam. included 1975 Stem shrubby, Leaves lanc. nervose and branches hairy, Sepals oblong and lanceolate acute, Styles hairy 1976 Stem smooth, Leaves lanceolate rough above, Flowers cymose equal, Tube of flower very long
1977 Stem shrubby, Branches and leaves prickly, Flowers in spikes, Corollas nearly equal
1978 Stem shrubby, Leaves Ianc. atten. at base hairy, Hairs very short, Bract. and cal. strigose, Stam. exserted 1979 Stem shrubby upright branched, Leaves oblong lanc. hairy, Cor. campanulate small, Stamens exserted
1980 Stem and lanceolate acute leaves silky, Spike terminal nearly simple leafy
1981 Stem smooth, Leaves lanceolate smooth ciliated prickly, Cor. equal
1982 Stem smooth, Leaves lanceolate smooth scabrous at edge
1983 Stem branched, Leaves lanceolate nerved and branches silky, Styles hairy, Racemes cylindrical
1984 Leaves lanceolate nerved and branches silky, Styles hairy, Racemes ovate
1985 Stem villous, Leaves sword-shaped elliptical villous, Spike compound linear oblong
1986 Stem shrubby, Branc. and cal. smooth, Lvs. lanc. glauc. veinl. smooth above with a few coarse hairs at back
1987 Leaves radical ovate lined stalked
[towards the end
1988 Stem herbaceous hairy, Leaves linear lanc. strigose hairy lower nerved, Cor. equal, Stamens exserted
1989 Stem erect hispid, Leaves linear lanceolate hispid, Spike compound terminal, Cor. nearly equal
1990 Stem warted hispid, Cauline leaves lanceolate hispid, Flowers spiked lateral
1991 Cor. as long as stamens, Tube shorter than calyx
1992 Leaves spatulate lanceolate villous, Stam. shorter than corolla
1993 Stem herb. erect panic. hisp. dotted, Lvs. lin. lanc. strigose, Flowers remote, Stamens $\frac{1}{2}$ as long again as cor. 1994 Stem herb. echinate, Lvs, obl. lanceol. hispid little narrowed at base, Stam. as long as cor. Cal. of fr. distant 1995 Stem branched, Cauline leaves ovate, Flowers solitary lateral
1996 Stem nearly simple, Lvs. lanc. rather silky, the radical very long on stalks, Spikes axillary bent backwards 1997 Stamens shorter than cor. Cal, as long as limb, Leaves lanceolate strigose

1998 Stem shrubby, Leaves stalked, Flowers hypocrateriform
1999 Stem herbaceous, Leaves sessile, Flowers funnel-form
2000 Leaves ovate-lanceolate hairy, Peduncles branched, Spikes pendulous
2001 Leaves ovate entire naked, Spikes in cymes
2002 Leaves ovate acuminate smooth above rugose, Spike cymose erect recurved
2003 Leaves nearly lanceolate hoary, Stem half shrubby
2004 Leaves ovate acuminate nearly smooth, Leafstalks hairy, Stem climbing, Cal. 5-parted
2005 Stem climbing, Leaves ovate oblong acute repand smooth, Berry with 4 projections bipartible

## 2006 Leaves ovate oblong, Cal. pyramidal, Sepals triangular sagittate

2007 Stems rounded, Leaves imbricated, Flowers sessile
2008 Vilious, Scapes 1-flowered
2009 Stem branching, Leaves smooth above, Pedunc, short, Petals conniving

and Miscellaneous Particulars.
346. Tournefortia. So named by Linnæus, after Joseph Pitton de Tournefort, author of an elegant arrangement of plants under the title of Institutiones rei Herbaria, and the father of the French school of botany. The system of Jussieu is founded upon that of Tournefort, or is rather an adaptation of the principles of that botanist to the actual state of the science. The species are by no means handsome either in fowers or foliage, and in some cases the latter is even fetid.
347. Nolana. Is a diminution of nola, signifying a bell in low Latin. The name has been applied to this plant on account of its bell-shaped corolla. The species are hardy annuals, of beautiful appearance when in flower. They may be sown in the spring in the open border, where they will grow without protection.
348. Aretia. In honor of Benoit Aretio, a Swiss, professor in the university of Berne. He died in 1574 . He published a work upon alpine plants, and his name has been applied to a charming alpine genus, said by some, with little reason, not to be distinct from Primula. The species are very delicate, and require good air and skilful cultivation to succeed well. They are peculiarly suitable for rock-work or growing in pots, well drained, and filled with turfy loam and peat.

## Hislory, Use, Propagation, Culture,

349. Androsace. From avn९, avסeas, a man, and $\sigma \alpha z o s$, a buckler; the large round hollowed leaf of the comhave been something very different to the buckler of the ancients. The Androsace of Pliny and others must Aretia. Aretia
350. Primula, is derived from primus, the first, - to flower; the delicate blossoms of many of the species appearing when all nature is otherwise inert. This genus consists of beautiful dwarf alpine plants, valuable in horticulture, on account of their fowering early in spring, and being prolific in variation.
P. vulgaris is a native of most parts of Europe in woods and hedges on a moist clayey soil. It is generally found with brimstone-colored flowers, and single; but in some places, though rarely, it is found of a white, and again, of a purple hue, and occasionally double. The leaves and roots, which smell of anise, when dried, rieties of this plant snuff, act as a sternutatory, and, taken internally, as an emetic. The varieties and subvamanent varieties. The Hon. W. manslip W. Herbert says, he raised from the seed of one umbel of a highly-manured red cowslip, and a natural priwsip, and oxlips, of the usual and other colors ; a black polyanthus, a hose-in-hose cowslip he raised aral primrose bearing its flower on a polyanthus stalk; and from the seed of the hose-in-hose stance was never befose-in-hose primrose. (Hort. Trans. iv. 19.) But this requires confirmation, as the circum-

The varieties of $P$. vulgaris are For distinction's sake we shall consider them as species or subspecies. are on separate pedicels, rising from the root upon a the leaves of the plant, and are bels on a scape or flower-stalk cisiled primroses. The second class includes all those whose flowers are in umroses there are about a dozen beautiful ver three to six inches or more, and are called polyanthuses. Of the primreadily added to by propagation from seed. The names of the and of the polyanthus an astonishing number, riven above, are entirely arbitrary. The rules The names of the varieties, with the exception of the double sorts riven above, are entirely arbitrary. The rules for judging of the beauty or merits of a variety are also wholly artificial, and founded on an inaginary form far removed from ordinary nature. These rules or canons are

2010 All villous, Leaves ovate oblong and sepals toothed, Involucres very large, Flowers very small
2011 Much branched rough, Branches spreading, Leaves obl. somew, toothed, Sepals lanc, ent. Fl. very small
2012 Roughish erect, Lvs. lanc. tooth atten. at base, Prop. ped. elong. upright, Cor. longer than cal. Pet, ov. ent.
2013 Leaves lanceolate entire villous, Umb, few-flowered, Cor longer than the ovate campanulate calyx
2014 Smooth, Lvs, lanc. lin. tooth. at end, Ped, sprdg, elon. Cor. longer than cal. pet. obcord. (A. coronopif. B, M.)
2015 Pubescent, Leaves lanc. nearly entire ciliated, Umb. few-flowered, Cor. longer than the turb. calyx
2016 Caulesc. smooth, Lvs, lin. shining ent. cil. at end, Umb. few-fl. Stalks elong. Cor. Ionger than turb. calyx 2017 Caulesc. pubesc. Lvs, scattered lin, subulate ciliat. Umb. few-fl. Stalks short, Cor. longer than turb. calyx 2018 Leaves elliptical lanceolate smooth, Scapes umbellate
2019 Lvs. ov. lanc. from middle to end acutely toothed, Scape lvs, and stalks rather long. than invol. Cor, shorter than angular cal. (A. Bocconi of Gardens.)
2020 Leaves obovate oblong toothed rugose villous beneath, Umb. radical, Flower-stalks as long as lvs. Cor, flat

2021 Leaves toothed rugose hairy on both sides, Umbel many-flowered with outer flowers nodding, Cor, flat
2022 Lvs. toothed rugose hairy beneath, Umb. many-flowered, Flowers all nodding, Cal. angular, Cor, concave 2023 Lvs. cuneate lanc. rug. cren. tooth. powdery, Umb. many-fl. Ped. spread. Tube gland. at end, Limb flat the 2024 Leaves sessile lanc. spatul. entire smooth on both sides, Outer fl. nodding
[length of tube
2025 Lvs. cordate stalked doubly crenate smooth beneath hairy at the veins, Stalks villous, Umb. many-fl. erect 2026 Leaves cordate crenate-lobed very rugose, Corolla acutely toothed
2027 Leaves oblong spatulate toothed green on each side, Leaves of involucre auricled at base
2028 Leaves obl. oval serrulate villous pale green, Scape 2-3-fl. erect rounded, Cal. globose, Tube of cor. villous
2029 Leaves lanc. flat finely toothed smooth, Umb. many-fl. erect, Leaves of invol, connate at base
2030 Leaves smooth on each side crenate powdery at edge, Cal. very short (P. crenata, Lehm.)
2031 Leaves obov. ent. or serr. fleshy, Scape central as long as Ivs. Umb. erect, Inv, with short lvs. Cal. powdery 2032 Leaves spatulate serrated smooth, Scape lateral, Umbel nodding, Involucre with large leaves
2033 Leaves elliptical nearly entire thickish cartilaginous at edge, Uinb. 2-3-f. erect, Cal. tubular obtuse
2034 Leaves ovate entire stalked smooth, Umb. erect 3-f. Cal. campanulate, Cor. cyathiform
2035 Leaves wedge-shaped shining many-toothed at end, Scape about 1-fl. Petals half bifid like a Y
2036 Leaves stalked ovate cordate rugose, Umbel proliferous, Cal. inflated
2037 Lvs. lan. obov. tooth. stlk. beneath nearly nak. Um. few-fl. erect, Lvs. of inv. lan. Pet. obov, short. than tube 2038 Resembles P. farinosa. Distinguished by its flat corolla, and more robust habit
2039 Leaves obovate oblong close toothed smooth somewhat wavy, Umb. pubesc. Cal, ovate gaping, Cor, flat
2040 Leaves obovate spatulate beneath and scape mealy, Segments obcordate toothed
2041 Leaves obovate tongue-shaped entire vill. viscid, Umb, many-fl. erect, Leaves of inv, ovate short membr. 2042 Leaves flat coarsely serrated acute, Cal, viscid, Pedicels longer than scape

## and Miscellaneous Particulars,

agreed on by the general consent of florists; they were first brought forward by the Dutch, and are now to be found in the treatises on florists' flowers of all countries : one of the best in this country is Maddocks's Florist's Directory.

The culture of $P$. veris as a border flower is abundantly simple, as it will grow any where, but best in a situation shaded, from the mid-day sun, and in a loamy soil; but its culture as a florists' flower, the crossing to procure new varieties, and all the various cares of the florist involve details much too tedious for this work, if they were to be given at such length as to be of real use. We refer to Maddocks, Emerton, and Hogg, and to the Encyclopedia of Gardening.
P. elatior is found in the same situations as the primrose, but is much less common than either it or $P$. veris, It has little or no smell, Sir J. E. Smith considers it as probably a hybrid between the cowslip and primrose. There are two or three varieties of oxlip, but they are not considered as florists' flowers.
P. veris smells more strongly of anise than the primrose. Its leaves have been used as a pot-herb, and in salads, and are recommended for feeding silk-worms. The flowers make a pleasant wine, flavored like muscadel, but considered somniferous. Liquors and syrups are sometimes tinctured with the leaves. Having been less cultivated than the primrose, there are but few varieties of this plant in gardens. They may be raised from seed, however, to any extent, as Messrs. Gibbs, of the Brompton nursery, and others, have lately proved.
$\mathbf{P}$. auricula is a well known favorite of the florist. It is a native of the alpine regions of Italy, Switzerland, and Germany, and found also about Astracan. The most common colors in its wild state are yellow and red, sometimes purple, and occasionally variegated or mealy. The cultivated are innumerable, and many of them of exquisite beauty and fragrance. The leaves in different varieties differ almost as much as the flowers, a circumstance which does not take place to the same extent in the variations of $\mathbf{P}$. vulgaris or veris. Near most of the manufacturing towns of England, and many in Scotland, the culture of this flower forms a favorite amusement of weavers and mechanics. Lancashire has been long famous for its auriculas : it is no uncommon thing there for a working man who earns, perhaps, from $18 s$ s, to 30 s. per week, to give two guineas for a new variety of auricula, with a view to crossing it with some other, and raising seedlings of new properties,

## History，Use，Propagation，Culture，

As to the soil proper for auriculas and polyanthuses，much has been written，and some highly artificial com－ positions of bullock＇s blood，sugar－baker＇s scum，night－soil，fuller＇s earth，\＆c．recommended．Many of the most successful growers，however，use nothing more than a loam from an old pasture or hedge－row，kept and turned over occasionally during a year，and then mixed with hot－bed dung rotten to a mould，or with leaf－mould，and some sand to keep it open．The soil and manure must be well mellowed by time before using，and not mixed till it is wanted，as that is said to generate worms．（See Encyc．of Gard．art．Primula．）

P．auricula，helvetica，nivalis，and viscosa，are considered by Herbert as only varieties of one original，for he says he raised a powdered auricula and a P．helvetica from P．nivalis，and a P．helvetica from P．viscosa．（Hort Trans，iv．20．）These，and the other species of this genus，are well adapted for being kept in pots of loam and leaf－mould，or loam and peat well drained，and in frosty or wet weather during winter，protected by a frame to imitate their natural covering of snow in alpine regions．Sweet says，＂they require to be shifted and parted frequently，for if left too long without these being done，they will dwindle away and die．＂The best time for parting and shifting is after they have done flowering．

P．scotica，a pretty plant，resembling $\mathbf{P}$ ．farinosa，has lately been discovered in Scotland by Dr．Hooker，pro－ fessor of botany at Glasgow．
351．Cortusa．So named by Mathiolus，in honor of his friend J．A．Cortusus，who first noticed it．This is a handsome little alpine，requiring a similar treatment to the Swiss Primulæ．

352．Soldanella．The diminutive of solidus，a shilling．The round leaves of these plants are very like pieces of money．They are among the least and most beautiful of alpine plants，and remarkable for the man－ ner in which their corolla is cut or lacerated．Culture as in the Swiss Primula．
353．Dodecatheon．A name of the Romans，signifying 12 gods or divinities，applied with apparentinaptitude by Linnæus to a plant，native of a world the Romans did not know，and resembling in no particular that of their writers．It was originally named Meadia by Mark Catesby，in honor of Dr．Mead，but the name was continued only as a specific appellation by Linnæus．It is very ornamental when in flower；afterwards the leaves die away，and the root only remains till next season．It is not easily kept ；but thrives better in a bed of light loamy soil，in a shady and rather moist situation，than in pots．
354．Cyclamen．Derived from zuะえos，a circle，on account of the numerous coils of the fruit－stalks．This genus consists of humble plants with very beautiful flowers，In the north of Italy wild swine feed on its

## 2043 The only species

## 2047 Leaves orbicular cordate entire, Segments of cor, ovate

2048 Leaves orbicular cordate crenate or toothed, Segm. of cor. lanceolate
2049 Leaves oblong ovate cordate or reniform-cordate crenated, Segm. of cor. oblong obtuse 2050 Leaves cordate oblong acuminate angular toothed, Segm. of cor, oblong lanceolate rather acute 2051 Leaves cordate crenulate emarginate, with the base overlapping, Flower short, Styie exserted

2052 Flowers vertical stalked, Leaves under water all finely cut
2053 Racemes terminal compound, Leaves opposite 3-4 together oblong lanceolate
2054 Racemes terminal, Petals obovate spreading, Leaves linear lanceolate sessile
2055 Smooth branching, Leaves opp. or whorled long linear spotted, Raceme terminating a short scape 2056 Racemes terminal, Petals conniving, Stam. shorter than corolla, Leaves lanceolate stalked
2057 Racemes terminal, Petals lanceolate spreading, Leaves lanceolate sessile
2058 Racemes axillary stalked ovate compact, Leaves opp. lanceolate
2059 Smooth, Stem simple spotted, Leaves opp, sess. lanc. acute spott. Flowers in close heads
2060 Leaves $3-4$ together ovate lanc. stalked pub. beneath, Ped. axill. whorled, Pet. ovate fringed with glands
2061 Leaves whorled obl. lanc. stalked, Pet. ovate acute glandular, Stem pubescent
2062 Leaves subsessile 4 - 5 together oval acuminate dotted, Peduncles four, 1-flowered, Petals oval entire 2063 Pub. Lvs. opp. on long stalks cord, ovate, Fl-stalks axill. in pairs, Fl. cernuous, Petals rounded crenulate 2064 Smooth much branched, Leaves linear very long, Segments of cor. serrulate
2065 Smooth, Leaves opp on long stalks lanc. Petioles ciliated, Fl. cernuous, Cor. shorter than cal. Pet. cren.
2066 Leaves lanc. sessile, Peduncles axillary opp. Stem much branched smooth, Cal. longer than corolla
2067 Leaves ovate acute, Flowers solitary, Stem procumbent, Stamens smooth
2068 Leaves opposite roundish cordate, Pedunc, axillary 1-flow. Stem smooth creeping, Stamens glandular
2069 Stem procumbent, Leaves 3-nerved ovate lanceolate petals dilated at end crenate with glands
2070 Leaves 5 -nerved ovate lanceolate, Stem erect a little winged, Petals toothed at end
2071 Leaves lanceolate about 3 together sessile, Stem shrubby at base rounded, Branches diffuse angular 2072 Leaves cordate stem-clasping, Stem brachiate erect

and Miscellaneous Particulars.
bulbs, which are round, flattened, and solid, and as large as pigeons' eggs. When the flowers fade the pedicels twist ap like a screw, inclosing the germen in the centre, and, lying close to the ground among the leaves, remain in that position till the seeds ripen. The plant is peculiarly adapted for pots, and for chamber decoration in spring. C. hederæfolium is very scarce, and agreeably fragrant. C. persicum is tender; the others are quite hardy.
355. Hottonia. In honor of Peter Hotton, a professor in the university of Leyden, born in 1648, died in 1709. He wrote several academical dissertations, and published remarks upon medicinal plants, valuable in their day. Plume d'cau, Fr. Wasserviole, Ger., and Miriofillo aquatica, Ital. This singular aquatic has roots consisting of white capillary fibres, which strike deep into the mud. The leaves grow in tufts under the water, and only the upper part of the fowering stem rises above it, producing a showy spike of white and blue fowers. It affords refuge to the fresh-water periwinkle (Turbo Littoreus), and other small shellfish. The seeds being sown in a pond when ripe, the plants will rise in the water the spring following.
356. Lysimachia. From $\lambda थ \sigma s^{\prime} \mu x \chi n$, of which the English name Loose-strife is a translation; it has been given to this plant from the quality absurdly ascribed to it by the ancients, of quieting restive oxen when put upon their yokes. Linnzus says it was named after king Lysimachus of Sicily, who first used it, which account is nearly the same as that of Pliny. Most of the species are bog or fen plants, of the easiest culture. L. nummularia is ornamental on moist rock-work or hanging from a pot in a northern exposure. Though one of the hardiest natives, it seldom produces ripe seeds, like most plants which multiply themselves much by the roots or stem. The flowers of $L$. thyrsiflora come out in lateral bunches from the axils towards the top of the stem, which Linnæus notioes as a singular circumstance in an upright plant. L. stricta, after flowering, throws out bulbs from the axils of the leaves, which, if allowed to lie on a moist surface, will produce young plants the following spring. $\mathbf{L}_{\text {. }}$ dubia requires to be treated like a tender annual.
357. Anagallis. From eva火e入oc, to laugh; the name expressing the medicinal qualities of the plant, which, by removing obstructions of the liver, removed a cause of low spirits and despondency ; so at least say Pliny and Dioscorides. A. arvensis is a beautiful trailing weed, and one of the Floræ horologicæ, opening its flowers regularly about eight minutes past seven o'clock in our latitude, and closing about three minutes past two o'clock. It also serves as an hygrometer, for if rain fall, or there be much moisture in the atmosphere, the fowers either do not open, or close up again. Small birds are very fond of the seeds. A. monelli is a very

## History, Use, Propagatzon, Culture,

beautiful small plant, and, with A, latifolia and linifolia, require the protection of a frame during winter. A. tenella is a delicate bog-plant, but not a very certain tenant of the genus. It is probably botanically distinct.
358. Diapensia. An ancient Greek name of the Sanicle, and signifying a plant which removes pain; the Sanicle being a vulnerary, Linnæus applied the name to this plant, which is neither a Sanicle nor a vulnerary, but a pretty alpine species, requiring the same cultivation as similar things, and retaining its deep green leaves through the severest winters.
 A small plant resembling Azalea procumbens, with heath-like leaves and minute white flowers. It is found on the White-Mountains of New Hampshire, and in Pine-barrens in other parts of North America, but is very rare in cultivation.
360. Coris. A name of Dioscorides, for which even the etymological ingenuity of a Linnæus or a De Théis have been unable to provide a meaning. It was given to a plant analogous to Hypericum, and resembling the heath. Tournefort applied the name to this plant, whose fine leaves, and purple or pink fowers, clothe, like the heath, the places where it grows wild.
361. Galax. From roele, milk, in allusion to its milk-white spikes of flowers. This is a neat little plant, and thrives best in a moist situation; where alone it flowers freely.
362. Menyanthes. From $\mu \eta y y$, a month, and ayAos, flower, in allusion to the power which the plant is supposed to possess of exciting menstruation. Buck-bean or Bog-bean, Eng., Bachsbohke, Ger. An infusion of the leaves is bitter, and is frequently recommended in dropsy and rheumatism. In Sweden the plant is used

2073 Leaves linear lanceolate opp. or whorled, Stems ascending
2074 Leaves sessile opposite 3-4 together lanceolate 3-nerved, Sepals linear acute, Cor, twice as big as calyx 2075 Leaves ovate acute, Stem creeping, Stigma acute

2076 The only species. Plant growing in dense tufts
2077 A small plant resembling Azalea procumbens
2078 The only species
2079 The only species. Roots deep red. Flowers in long slender spikes
2080 Leaves ternate
2081 Leaves cordate orbicular floating, Flowers umbelled, Corollas fringed
2082 Leaves reniform subpeltate beneath full of holes floating, Petioles flower-bearing, Corollas smooth
2083 Runners creeping, Leaves cordate roundish repand dotted beneath, Panic. opp. the leaves, Seeds smooth 2084 Leaves cordate roundish nerved floating, Petioles flower-bearing, Corolla hairy within
2085 Leaves radical cordate roundish spreading toothed, Stem long naked, Flowers panicled
2086 Leaves ovate erect, Flowers in panicled racemes fringed
2087 Leaves lanceolate smooth, Stem herbaceous 4-cornered cernuous
2088 Stem simple, Leaves linear-lanceolate
2089 Herbaceous, Leaves linear erect, Branches fastigiate, Peduncles elongated
2090 Leaves linear-lanceolate smooth spreading, Stem much branched shrubby, Fruit a berry
2091 Leaves linear spreading, Cal, ovate closed, Cor, clammy, Segm, cuneate pointed
2092 Shrubby, Leaves lanceolate subtomentose, Calyxes campanulate
2093 Shrubby subtomentose, Leaves close together decussate oblong obtuse, Cal. globose 5-parted

## 2094 The only species

2095 Stem herbaceous dichotomously panicled, Leaves ovate lanceolate, Cal. shorter than tube 2096 Flowers stalked, Segments of cal. shorter than tube, Style simple, Leaves ovate
2097 Stem nearly simple dwarf, Flowers clustered sessile, Cal. as long as tube of cor. Leaves lin. lanc. 2098 Herbaceous, Leaves oblong-lanceolate, Stem dichotomous corymbose rounded, Flowers stalked digynous 9099 Dwarf upright much branched, Lvs. oval obtuse, Fl. sessile fasc. clustered, Cal. $\frac{\lambda}{\frac{1}{8}}$ as long as tube of cor.

2100 Weak, Branches lax elongated 1-flowered, Leaves linear ellipt. Pet. obovate, Stem angular
2101 Erect leafy, Leaves oblong, Flowers solitary about 7 -parted, Cal. leafy longer than cor.
2102 Weak, Leaves lanc, erect, Branches few l-Howered, Flowers 7-13-parted, Sepals linear shorter than cor 2103 Erect, Leaves lanc. linear, Pan. many-flowered brachiate, Cal, subulate thrice as short as cor.

2104 Leaves obovate acute at each end, Flowers corymbose, Branches smooth, Stem erect
2105 Leaves lanceolate attenuate at each end smooth, Stipules lateral setaceous. Racemes axillary compound

and Miscellaneous Particulars.
as a substitute for hops, two ounces of the leaves being substituted for a pound of hops. The powdered roots are sometimes eaten in Lapland. The only species cultivated is the wild plant of our rivulets.
363. Villarsia. A genus divided from the last, and named after Villars, a French botanist of repute, who wrote the Flora of Dauphiny, in 1786, a work used even at the present day. This is an aquatic genus of easy culture, and increased by seeds or dividing at the root. V. nymphoides is one of the most elegant of British water-plants,
364. Chironia. Named after Chiron, one of the fathers of medicine, botany, and surgery. He is mythologically represented to have been the son of Saturn, or of Time and Experience. Many plants, the virtues of which he is believed to have first discovered, have borne his name. The genus, however, to which it is now applied, is probably not one of those. It consists of pretty plants of short duration, generally with pink flowers. The species are not long-lived plants, and therefore require to be frequently raised from cuttings. Peat mould suits them best, and a little loam mixed with it; and young cuttings planted in the same kind of soil, under handglasses, strike root readily.
365. Eustoma. From हैv, well, and sopes, mouth or orifice, in allusion to the colored aperture of the tube of the flower. A pretty little plant rarely seen in gardens. It resembles a Sabbatia.
366. Erythraa. From eguagos, red, in allusion to the color of the flowers. This is a pretty genus of herbaccous and annual flowers, but impatient of cultivation, and therefore rarely seen in gardens.
367. Sabbatia. Named after Liberatus Sabbati an Italian botanist, author of many works on botany. In 1772 he published the first volume of the Hortus Romanus, a fine work, in folio, of which the seventh and last volume appeared in 1784. A pretty N. American genus of plants resembling Chironia.

368, Logania. Named by Mr. Brown, after a Mr. James Logan, said to have been the author of some experi-

History, Use, Propagation, Culture,
ments upon the generation of plants. Small bushes or herbaceous plants with opposite entire leaves, and terminal or axillary bunches of white flowers. Eleven species, natives of New Holland, are described. Ripened cuttings may be struck in sand under a hand-glass.
369. Phlox. From $\varphi$ doE, flame. The plant so named by the ancients is supposed to have been an Agrostemna. The genus now so called is a native of North America only, and is one of the handsomest in cultivation. It consists of most elegant border flowers, valuable for blossoming late in the season, and for their lively colors of red, white, and purple, while the majority of plants that flower in autumn have yellow, and generally syngenesious blossoms. Most of the species delight in a rich moist soil, or loam and leaf mould or peat. The dwarf species are admirably adapted for pots, or a select rock-work : they require some protection in severe winters.
370. Polemonium. From roגt $\mu$, war. Pliny relates, that the plant which he called by this name received its appellation from having been the cause of a war between two kings, who could not agree which of them first discovered its virtues. It was also called Chilodynamia (from $\chi\langle\lambda 101$, a thousand, and $\delta$, count of its extraordinary merit. The plant which possessed all these good qualities is now forgotten. Its name has descended to a flower which ornaments the garden, but which preserves nothing of the virtue of its progenitor, beyond a slight vulnerary quality. P. cæruleum is a border flower of long standing, and of the easiest culture.
371. Vestia. Named by Willdenow, in his Enumeratio Plantarum, in honor of his friend Dr, Vest of Clagen-

2107 Leaves obl. lanc. somewhat wavy rough at edge, Stem smooth, Corymbs panicled, Segm. of cor, blunt
2108 Erect pubescent, Leaves ovate acum. beneath pubescent decussate, Cor, panic. Segm, of Cor. rounded
2109 Erect, Stem smooth not spotted, Leaves ovate lanc. quite smooth, Raceme panic. Teeth of cal. erect

and Miscellaneous Particulars.
furth. A native of Chili, with pale-green smooth leaves, and pale yellow flowers. It is very nearly related to Lycium.
372. Hydrophyllum. From i $\delta \omega \rho$, water, and $\phi u \lambda \lambda o y$, a leaf. This plant grows in the marshes of North America, and in the spirng time has a small quantity of water in the cavity of each leaf. The species are two only, both humble plants, with neat foliage, which protects the small white flowers. H. virginicum is used as a salad, under the name of Shawanese salad in North America.
873. Phacelia. From $\varphi \propto \approx \varepsilon \lambda о 5, ~ a ~ b u n d l e, ~ t h e ~ f l o w e r s ~ b e i n g ~ d i s p o s e d ~ i n ~ f a s c i c l e d ~ s p i k e s, ~$
374. Ramonda. Named after M. L. Ramond, a French botanist, who discovered many new plants in France. A very pretty dwarf plant, kept in a frame with other alpine plants. Formerly a species of Verbascum, (V. myconi.)
375. Verbascum. An alteration of barbascum, on account of the beard (barba) with which all the leaves and stems are closely covered. The species are all very fine looking plants, well calculated for shrubberies, among other tall plants. They have been well illustrated by M. Schrader in a learned Monograph. V. thapsus has been so called from its native place, the Isle of Thapsos. V. blattaria is said to have the power of driving away the blatta or cockroach. V. pulverulentum is one of the most magnificent of native herbaceous plants, sending up a stem a yard high, covered with many hundreds of gold colored fowers. Correa observes of this golden rod, that in still weather two or three blows with a stick will bring down all the corollas. The nap of

History, Use, Propagation, Culture,
this species, of V, lychnitis, and of several others, may be used as tinder, and to make wicks for lamps; whence the name Lychnitis applied to one of the species, from $\lambda u \chi$ yos, a lamp. Scveral mules have been produced between the species of this genus; and it has been questioned whether those accounted species are not productions of this kind.
376. Datura. An alteration of the Arabic name tâtôrah, Forskahl. About Goa and Canara, it is called Daturo, Rumphius. Stramonium is an abbreviation of the Greek word $\sigma \pi \rho \chi^{\text {vopervisov, or mad-apple, on }}$ account of the dangerous effects of the fruit of that species. Metel or Methel, is an Arabic name employed by Serapion, ch. 375, and expresses the narcotic effect of the plant. Tatula is altered from Datula, a name given to the Datura by the Turks and Persians. D. stramonium is an instance of a South American plant, naturalized within a comparatively short time, the seeds having been introduced from Constantinople in Gerarde's time, and by him "dispersed through this land." Kalm says, that this plant and a species of Phytolacca are the worst weeds in America. Professor Martyn observes, that "in the earth brought with plants from various parts of that extenslve country, we are sure to have the thorn-apple come up." At night, the leaves next the flowers rise up and enclose them. The whole plant smells strongly of bean meal. Every part of the plant is poisonous, bringing on delirium, tremors, \&c. but under proper regulations it is a useful medicine in asthma, \&c.
D. fastuosa has a fine polished purple stalk, varied with dots or lines; the leaves are large, the flowers of a beautiful purple outside, and a satiny white within; some are single, others semidouble. They have an agreeable odor at first, but if long smelt to become less agreeakle, and are narcotic. D. ceratocaulon is a fine species; its seed will sometimes remain in the ground several years before it will vegetate.
377. Brugmansia. So named by Persoon, in honor of Professor S. J. Brugmans, author of some botanical works, and especially of a dissertation "De Plantis Inutilibus, et Venenatis," published at Groningen, in 1783.
B. arborea is one of the greatest ornaments of the gardens of Chili. The flowers which come out at the

## Leaves sessile.

and Miscellaneous Particulars.
divisions of the branches, have a loose tubular calyx nearly four inches long, which, opening like a spathe, a corolla is protruded, with a narrow trumpet-shaped tube, which spreads wide at the brim, where it is divided into five angles, which terminate in very long points: they are white within, pale yellow outside, and one tree will perfume the air of a large garden. It flowers freely in the bark-stove, in a moist heat.
378. Lisianthus. From $\lambda \nu \sigma \iota$, dissolution, and $\propto y$ ios, a flower; a name given to the plant on account of the medical virtues possessed by it of dissolving humours. It is a powerful cathartic. The species are very handsome stove plants. Cuttings root readily in sand under a bell-glass.
379. Spigelia. So named by Linnæus, in honor of Adrian Spigelius, born at Brussels in 1578 ; professor of anatomy and surgery at Padua; author of Isagoge in rem Herbariam; died in 1625.
$S$. anthelmia is so named from its peculiar efficacy in destroying worms, for which it has been long in use among the negroes in the West Indies. Dr. Browne, after a number of successful experiments, says it operates in so extraordinary a manner, that no other simple can be of equal efficacy in any other disease, as this is in those which proceed from these insects. (Hist. of Jamaica.) The same plant procures sleep almost as certainly, and in an equal degree with opium.
S. marilandica is used as a vermifuge in North America, and according to Dr. Garden, (Letters to Dr. Hope, with very powerful effects. The annual plant may be treated like other tender annuals; but S. marilandica is rather difficult to preserve; according to Sweet, "it requires to be grown in a pot, that it may be protected from severe frosts, or too much wet: it will sometimes survive the winters when planted in the open ground in a bed of peat: the best soil for it is an equal mixture of loam and peat, and young cuttings, planted under a hand-glass, root readily." (Bot, Cult, 424.)
380. Nicandra. Nicander was a Greek phystcian, who lived about a century and half before Christ. The genus was formed by Adanson; it consists of the Atropa physaloides of Linnæus. The Indians of Peru make use of the berries of this plant to bring away gravel, and to relieve persons who have a stoppage of urine.

## History, Use, Propagation, Culture,

381 Hyoscyamus. From i $\dot{s}$ sios, a pig, and zvauos, a bean ; the fruit has been thought to resemble a bean, and, although dangerous to other animals, is said to be eaten by pigs with safety. H. niger is a well-known foetid weed, which follows civilized man, growing on rubbish of old houses, dunghills, \&c. It has a strong peculiar odor, greatly affecting the heads of some persons, and the whole plant is reputed poisonous. Sir J. E. Smith and Professor Martyn say they have often eaten the seeds without suffering inconvenience. Lightfoot, on the contrary, says, a few of them have been known to deprive a man of his reason and limbs. A species of bug (Cimex) and of beetle (Chrysomela) take their specific names from feeding on the plant; but no quadruped is known to eat it, unless the goat and sheep, and that very rarely and sparingly. As a medicine, henbane is of immemorial use, and is still continued in the Pharmacopœias. It is given with or without opium in coughs, epilepsy, convulsions, \&c. Country people sometimes smoke the leaves for the toothach.
382. Nicotiana. So named from John Nicot of Nismes, in Languedoc, ambassador from the king of France to Portugal, who procured the seeds from a Dutchman who had received them from Florida. The first plant was said to have been presented to Catherine de Medicis, whence the French name Herbe à la Reine. The name tobacco, which has superseded all others, is the appellation of a district of Mexico. Petum or Petume, Bras., Tabac, Fr., Taback, Ger., and Tabac, Ital. The species grown as tobacco are the N. tabacum and rustica; the former greatly preferred. The popular narcotic which it furnishes is probably in more extensive use than any other, and its only rival is the betel of the east. According to Linnæus, tobacco was known in Europe from 1560. It was brought to England from Tobago in the West Indies, or Tobasco in Mexico, (and hence the name,) by Ralph Lane, in 1586, but only the herb for smoking. Afterwards, according to Hakluyt, seeds were introduced from the same quarter. Sir Walter Raleigh first introduced smoking; in the house in which he lived at Islington are his arms on a shield, with a tobacco plant on the top. Smoking has consequently been common in Europe for upwards of two centuries. It is a powerful narcotic, and also a strong stimulant with respect to the whole system, but especially to the stomach and intestines, to which, in small doses, it proves emetic and purgative. The smoke thrown up the anus acts as a glyster: an infusion of the leaves forms a powerful lotion for obstinate ulcers : the oil applied to a wound, is said by Redi to be as fatal as the poison of a viper. The decotion, powder, and smoke of tobacco, are used in gardening to destroy insects, and in agriculture for the same purpose, and to cure cutaneous eruptions in domestic animals.
Tobacco, as used by man, says Du Tour, (Nouveau Cours d'Agriculture, \&c.) gives pleasure to the savage and the philosopher, to the inhabitant of the burning desert and frozen zone. In short, its use either in powder, to chew, or to smoke, is universal ; and for no other reason than a sort of convulsive motion (sneezing) produced by the first, and a degree of intoxication by the two last modes of usage. A hundred volumes, he adds, have been written against it, of which a German has preserved the titles. Among these books is that of James Stuart, king of England, who violently opposed it. The Grand Duke of Moscow forbade its entrance into his territory under pain of the knout for the first offence, and death for the next. The emperor of the Turks, king of Persia, and Pope Urban VIII. issued similar prohibitions, all of which were as ridiculous as those which attended the introduction of coffee or Jesuit's bark. At present, all the sovereigns of Europe, and most of those of other parts of the world derive a considerable part of their revenue from tobacco.
Tobacco is cultivated in Europe as far north as Sweden, and is also grown in China, Japan, and other eastern

and Miscellaneous Particulars.
and hot countries. The sort preferred is the N. tabacum, which is an elegant plant, grown also in gardens as a border flower. N. rustica, fausse tabac, Fr., Bauern taback, Ger., and Tabacca cimarosa, Span., is also frequently cultivated, especially in Europe, it being considered hardier than the Virginian sort. Parkinson says, he has known Sir Walter Raleigh, when prisoner in the Tower, prefer it to make good tobacco, "which he knew so rightly to cure." Tobacco has been successfully cultivated and cured in this country, but its growth is prohibited to encourage our commerce with America. It is now only grown for curiosity as a border flower, or by gardeners for the destruction of insects. In Germany and other northern countries, most families who have gardens grow enough of N. rustica for their own use; but as they do not know how to cure it, it is not much valued, and is never made into chewing tobacco or snuff.

In the culture of Tobacco in America, the plants are raised on beds early in spring, and when they have acquired four leaves, they are planted in the fields in well prepared earth, about three feet distance every way. Every morning and evening the plants require to be looked over, in order to destroy a worm which sometimes invades the bud. When four or five inches high they are moulded up. As soon as they have eight or nine leaves, and are ready to put forth a stalk, the top is nipped off, in order to make the leaves longer and thicker, by directing all the energies of the plant to them. After this, the buds which sprout from the joints of the leaves are all plucked, and not a day is suffered to pass without examining the leaves, to destroy a large caterpillar, which is sometimes very destructive to them. When they are fit for cutting, which is known by the brittleness of the leaves, they are cut with a knife close to the ground, and, after lying some time, are carried to the drying shed, where the plants are hung up by pairs upon lines, having a space between, that they may not touch one another. In this state they remain to sweat and dry. When perfectly dry, the leaves are stript from the stalks and made into small bundles tied with one of the leaves. These bundles are laid in heaps, and covered with blankets. Care is taken not to over-heat them, for which reason the heaps are laid open to the air from time to time, and spread abroad. This operation is repeated till no more heat is perceived in the heaps, and the tobacco is then stowed in casks for exportation, (Long, Jam. iii. 719.)

In the manufacture of tobacco, the leaves are first cleansed of any earth, dirt, or decayed parts; next, they are gently moistened with salt and water, or water in which salt along with other ingredients has been dissolved, according to the taste of the fabricator. This liquor is called tobacco sauce. The next operation is to remove the midrib of the leaf; then the leaves are mixed together, in order to render the quality of whatever may be the final application equal : next, they are cut into pieces with a fixed knife, and crisped or curled before a fire; the succeeding operation is to spin them into cords, or twist them into rolls by winding them with a kind of mill round a stick. These operations are all performed by the grower, and in this state (rolls) the article is sent from America to other countries, where the tobacconists cut it into chaff-like shreds for smoking, by a machine like a straw-cutter; form it into small cords for chewing; or dry and grind it for snuff. In manufacturing snuff, various matters are added for giving it an agreeable scent, and hence the numerous varieties of snuff. The three principal sorts are called Rappees, Scotch or Spanish, and Thirds, The first is only granulated, the second is reduced to a very fine powder, and the third is the siftings of the second sort. The best Havannah segars are made from the leaves of N. repanda. The Indians of the Rocky Mountains of N. America prepare their tobacco from N. quadrivalvis and N. nana.

History, Use, Propagation, Culture,
383. Ipomea. From iq usos, a bindweed, or something analogous, and opovos, similar. This genus is nearly allied to Convolvulus and Calystegia. It consists chiefly of twining stove plants, free flowerers, and of the easiest culture. I. tuberosa is a plant of great beauty and fragrance. In Jamaica it is evergreen, thickly covered with leaves and large flowers, and much used to shade arbors, Browne says it may be carried over an arbor of 300 feet in length. Every part of the plant abounds with milk, and is purgative. Long thinks Scammony might be made from its tubers, and Loureiro affirms them to be edible.

## Q 1. Leaves pinnate, digitate, or palmate.

2207 Leaves pinnate pinnæ filiform, Pedunc. a little longer than leaf 1-flowered
2208 Leaves palmate, Segments narrow pinnatifid toothed, Pedunc. about 2 flowered
2209 Leaves digitate, Leafets stalked, Pedunc. 1-flowered
2210 Leaves palmate, Lobes 7 lanceolate acute entire, Pedunc. 3-flowered
2211 Smooth, Leaves palmate, Lobes 7 oblong lanc. entire, Cymes dichotomous, Cal, equal obtuse, Caps, erect
2212 Leaves digitate in 5s hairy entire, Seeds smooth
2213 Leaves digitate in 7, Peduncles umbelled very short
2214 Leaves digitate or nearly pedate 7 -parted smooth, Stalks warted rough, Pedunc. 1-flowered
2215 Leaves palmate pedate, Lobes ciliate mucronate at end, Pedunc. 1-flowered
2916 Leaves palmate, Flowers aggregate
2217 Branches peduncles and petioles tubercled, Leaves palmate, Lobes 7 narrow oblong with a short point 8. Leaves cordate, angular, or lobed.

2218 Leaves obl. cordate rarely obsoletely 3-lobed, Pedunc. 1-f. shorter than leaf, Calyx very smooth
2219 Leaves cordate 3-lobed villous, Pedunc. 2-3-f. Edge of cor. nearly entire, Stigmas 3 -lobed
2220 Branches petioles peduncles and calyxes bristly, Leaves naked cordate 3-lobed, Lobes tooth sinuated
2221 Stem twining, Leaves cordate 3-lobed, Pedunc. longer than petiole, Fruit nodding
2222 Leaves cordate angular, Stem membranous square, Peduncles many-flowered
2223 Leaves cordate acuminate angular, Pedunc. first dichotomous afterwards branching
2224 Downy, Lvs. cord. acum. at base angular, Pedunc. 5 -flowered, Cal. warted bearded, Limb. of cor. entire 2225 Smooth, Lvs. cord. below obscurely repand or ang. Pedunc. short 1-fl. Cal. hairy ciliated, Cor. small short 2226 Leaves cordate at the end 5-lobed smooth, Peduncle many-flowered corymbose

2227 Very smooth, Leaves cordate entire or angular, Pedunc. 1-3-f. Cal. aristate, Cor, undiv. Tube very long 2228 Pedunc. upwards cymose trichotomous longer than the 5-lobed cordate or hastate leaves
2229 Leaves cordate entire or 3-lobed acuminate above pubescent beneath villous, Flowers numerous in cymes 2230 Smooth, Leaves cordate acuminate entire, Peduncles many-flowered without bracteæ
2231 Stem warted, Leaves cord, ovate rugose villous beneath entire or lobed, Pedunc. 1 many-fl. Seed woolly

## 2232 Leaves 3-lobed, Flowers aggregate

§ 3. Leaves cordate entire.
2233 Leaves cordate acute entire, Pedunc. 1-flowered solitary as long as leaves
2234 Leaves cordate, Pedunc. many-fi. Outer calyx orbicular, Cor. campanulate lobed
2235 Leaves cordate entire, Flowers close together, Cor. undivided
2236 Leaves roundish cordate smooth, Pedunc. many-flowered, Cor, edged
2237 Leaves cordate oblong repand acuminate, Peduncles branched cymose
2238 Leaves cordate acuminate smooth, Peduncles 2 flowered
2239 Leaves cordate ovate acute above hairy, beneath silky, Pedunc. longer than the stalks in umbels
2240 Leaves cordate undivided, Fruit cernuous, Stalks thick, Leaves cordate entire, Ped. many-fl. Cal. hispid

2241 Stem very tall, Leaves orbicular rounded, Flowers spotted with eyes
2942 Leaves 3-lobed cordate, Peduncles 3-flowered
2243 Leaves 3-lobed cordate, Peduncles many-flowered racemose
2244 Leaves cordate 3-lobed, Flowers half 5-cleft, Peduncles shorter than the petioles
2215 Hairy, Leaves cordate 3-lobed, lateral lobes acuminate intermediate acute, Pedunc. 1-fl. Cal. hairy
2246 Leaves cordate 3-lobed, Lobes cuspidate, Peduncles 1-fl. Sepals Linear very hairy at base
2247 Leaves cordate acuminate hairy, Flowers aggregate
2248 Leaves cordate ovate obtuse entire, Pedunc. about 2-fl. Cal. coriaceous, Stem and petioles pubescent
2249 Leaves cordate roundish with a long point smooth, Pedunc, thick 3-fl. and cal. smooth, Stem muricated
2250 Leaves cordate acuminate, Pedunc. filiform 1-fl. and cal. smooth, Stem very hairy
§4. Leaves sagittate or hastate.
2251 Very smooth, Leaves oblong sagittate with a very deep sinus, Auricles acuminate, Pedunc. 1 -flowered 2252 Leaves linear hastate pointed, Auricles toothed, Flowers solitary, Cal. sagittate
2253 Smooth, Leaves hastate lanceol. or linear acute, Lobes toothed, Pedunc, 1-f. Sepals oblong lanc. ovate 2254 Leaves sagittate truncate behind, Peduncles 2-flowered
2255 Leaves linear hastate obtuse mucronate smooth, Auricles nearly entire, Peduncles 1 -flowered
\& 5. Leaves oblong, entire, or lobed.
2256 Leaves oblong 3-pointed dilated at base toothed, Pedunc. 1-fl. thick 4-cornered
8. Leaves rounded.

2257 Creeping smooth, Lvs, roundish emarginate or 2lobed thickish at base beneath with 2 glands, Cal, obt. 2258 Leaves emarginate with 2 glands at base, Peduncles 3-fiowered

and Miscellaneous Particulars.
I. bona-nox, like most of the species of this genus and Convolvulus, varies much in the leaves, which it produces cordate, lobed, or panduriform.
I. nil is a highly beautiful plant, with the corollas of a clear blue color, whence its name of Anil or Nil (Indign)

1. quamoclit is a most beautiful tender annual. Its name has been formed from zuapos, a bean, and zisros dwarf, because it resembles the kidney-bean in its climbing stem, but is less tall.
I. jalapa is found wild near Mexico, at Xalapa, whence probably the name of the drug which its ront affords. It is said to have been first brought to Europe in 1610. Its virtue as a purge resides chiefly in the resin.

History, Use, Propagation, Culture,
384. Convolvulus. From convolvere, to entwine. This is an extensive genus of some beauty, and the C. batatas is of known utility as an edible root. The stems in the greater number of species are herbaceous and twining, a few are shrubby, and one or two very low herbs.
C. arvensis has white jointed worm-like roots, very difficult to eradicate in gardens or corn-fields : it is considered as a certain indication of a dry soil.
C. scammonia, named in Arabia Scamuniâ (Forsk. Golius), affords the gummy resin of that name from the roots, which are three or four feet long, from nine to twelve inches in circumference, and contain a milky juice. The top of the root being bared of earth, it is cut through in a sloping direction, and a shell or cup placed close to the section for the juice to run into. This juice hardened is the true scammony, chiefly used as a stimulating cathartic.
C. turpethum is derived from turbid, its name in Arabia (Golius.)
C. batatas, (Batatas is Malay according to Rumphius, Mexican according to Nieremberg) skirrets of Peru, or Spanish potatoes, is a native of both Indies and China. It came first to Spain from the West Indies, from thence it was imported here annually, and sold as a delicacy. It is the potatoe of Shakspeare and contemporary writers, the Solanum tuberosum being then scarcely known in Europe. The batatas is cultivated in all the tro-

1. Climbing; leaves sagittate or hastate.

2259 Leaves sagittate acute at each end, Peduncles about 1-flowered
2250 Leaves sagittate truncate behind, Peduncles rounded 3-flowered
2261 Leaves cordate sagittate behind sinuate repand, Pedunc, axillary solitary about 2-fiowered
2262 Leaves lanceolate hastate acute, Auricles 1-toothed behind, Stem simple, Peduncles 1 -flowered
12. Climb゙ing; leaves cordate hastate.

2263 Leaves cordate hastate hirsute, Pedunc. about 3-flowered, Bract. linear remote from calyx
2264 Leaves cordate hastate angular lobed 5 -nerved smoothish, Ped. long, Fl. fasc. Sepals lanceol. acuminate 8. Climbing ; leaves cordate lobea.

2265 Leaves cordate villous at the base angular lobed, Peduncles 1-flowered, Outer sepals bract-like
2266 Pubescent, Leaves broad cordate entire or lobed fiddle-shaped, Pedunc. long, Flowers fascicled
4. Climbing ; leaves quinate or palmate.

2267 Leaves cordate sinuate silky lobes repand, Pedunc. 2-flowered
2268 Leaves 7 -lobed palmate hispid middle lobe sinuated drawn out, Pedunc. axill. solitary very long jointed
2269 Leaves palmate pedate 5 -parted, Pedunc. 1 -fowered
2270 Very smooth, Leaves digitate quinate, Leaflets stalked acuminate entire, Pedunc. branched divaricating \$ 5. Climbing ; leaves cordate or subcordatc.
2271 Leaves oblong cordate acuminate subrepand smooth, Pedunc. umbelled 5 -flowered, Flowers sessile
2272 Leaves cordate pubescent, Stem perennial villous, Pedunc. many-fowered
2273 Leaves cordate acuminate repand, Pedunc. 3-flowered, Stem mealy
2274 Leaves cordate ovate acuminate ciliated, Heads stalked very hairy with an involucrum
2275 Leaves cordate ovate acuminate entire smooth, Stem and leaf-stalks smooth
2276 Tomentose, Leaves cordate oblong obtuse subrepand, Pedunc, longer than stalk, Limb acute § 6. Prostrate ; leaves cordate
2277 Leaves cord, ovate upper acute, Ped. 1-f. shorter than leaves, Bractes obl. lanc. longer than ciliated cal.
2278 Leaves cordate ovate cusp. Ped. 2-fl. longer than leaves, Bractes lin. subul. shorter than parted peduncle
8. Prostrate; leaves cordate lobed or hastate.

2279 Leaves panduriform or entire emarginate cordate at base, Peduncles 1-flowered, Stem crecping
2280 Leaves hastate lanceolate, Auricles rounded, Stem creeping, Peduncles 1-flowered
2281 Leaves cordate and somewhat hastate villous, Stem and leaf-stalks hairy, Peduncles many-flowered
8. Prostrate; leaves ovate or oblong and linear.

2282 Leaves linear lanceolate, Stem ascending villous, Peduncles axillary 1-flowered 3 times as long as lcaf
2283 Leaves lanceolate obtuse naked lined, Branches declinate, Flowers silky $\frac{1}{2} 5$-cleft
2284 Leaves lanceolate silky lined stalked, Perluncles 2-fl. Cal. silky leafy
2285 Very hairy, Leaves linear, Flowers capitate, Calyxes acuminate
2286 Leaves lanceolate tomentose, Flowers capitate, Calyxes hairy, Stem nearly erect
2287 Stems erect shrubby, Leaves linear acute silky, Flowers terminal umbelled panicled, Cal. hairy
2288 Leaves linear lanc. acute, Stem branched nearly erect, Cal. hairy, Pedunc. 2-flowered
2289 Leaves neariy linear silky, Stem panicled, Cal. naked obtuse
2290 Leaves linear hairy, Peduncles about 3-flowered, Cal. silky ovate acute, Branches twiggy
2291 Prostrate hoary, Leaves linear lanceolate smooth, Thyrse terminal pyramidal compound
2292 Leaves lanceolate ovate smooth, Stem declinate, Flowers solitary

2293 Leaves wedge-shaped emarginate beneath silky, Peduncles 2-flowered

## 2294 The only species

2295 Leaves sagittate very acute, behind obtuse or trunc. entire, Bract. ac. longer than cal. twice as short as cor.
2296 Leaves cordate, Lobes angular truncated, Pedunc. rounded 1-f. Bract, ovate obt. inflated, Sepals obtuse 2297 Leaves cordate pubescent, Stem erect, Peduncles 1 -flowered
2298 Leaves reniform, Peduncles l-flowered, the angles winged

pical climates much in the same manner as our potatoe, but with more room for its trailing stalks. Not only the tubers, but the young leaves and tender shoots are boiled and eaten; and, as is the case with all plants long in cultivation, there are several varieties.
C. tricolor is a well known border-annual, commonly called C. minor, with reference to another borderflower, Ipomoea purpurea, which gardeners and seedsmen commonly cali C. major.
C. reptans, is a common potherb in the East Indies and in China.
385. Argyreia. From oogugov, silver, in allusion to the silvery texture of the leaves of the plant. A beautiful genus nearly related to Convolvulus.
386. Nemophila. From $\nu \in \mu \circ s$, a grove, and $\varphi \cdot \lambda \in \omega$, to love; the species growing in shady woods. A small hardy N. American plant, with bright blue flowers and divided leaves.
387. Calystegin. From zaios, pretty, and serv, a covering, in allusion to the two bractez in which the calyx is inclosed. A very artiticial genus, distinguished from Convolvulus and lpomoea, only by the presence of bracteæ, and by its capsule being one-celled C. sepium, the Convolvulus sepium of Willdenow, has anedical properties similar to Scammony, for which Withering thinks it may serve as a substitute. Swinc, it is said, eat the roots in large quantities, and yet are not purged by them. C. soldanella is an acrid purge.

History, Use, Propagation, Cutture,
388. Cobara. In honor of Barnadez Cobo, a Spanish Jesuit, who wrote upon subjects of natural history about the middle of the 17th century. The name arose with Cavanilles. This is the most rapid growing greenhouse climber known, having been found to grow 200 feet in length in one summer in a conservatory. It will thrive almost equally well in the open air during summer, but is destroyed by frost; and its shoots are only of annual, or at most of biennial duration. It strikes in sand in moist heat, but it generally riperis seeds, which, sown early in spring, and forwarded in a stove, will flower in the greenhouse or open air the same season.
389. Cantua. From Cantu, the native name of the genus among the Peruvians. Pretty greenhouse plants, rarely seen in gardens.
390. Hoitzia. Hoitzit is the name of this plant in Mexico. A handsome plant with brilliant scarlet flowers. It is occasionally raised from Mexican seed, but is very rare in collections.
391. Retzia. Named after John Retzius, professor of hotany at Lund, in Sweden. His Observationes Botanicæ is a work of reputation. A small upright shrub with whorled lanceolate leaves, and clustered brown flowers, almost hidden among the leaves.
392. Lubinia. A genus dedicated by Commerson to M. de Saint Lubin, a French officer who travelled in the East Indies. A small plant with ascending stem and fleshy smooth leaves, of little merit.
393. Epacris. Named by Forster from $\varepsilon \pi t$, upon, and aregos, the top of a thing; because in New Zealand the species grow on the top of the mountains. A most ornamental genus, which Sweet observes, thrives " best in a sandy peat soil; the rougher and more turfy the soil is, the better the plants will thrive; these should always be shifted in fresh pots before they are turned out of doors in spring, as their roots are so very fine, and are generally matted round the pots, so that the hot sun coming against the pots destroys them, and they look brown all through the summer, and are very difficult to recover. Young cuttings planted in pots of said under bell-glasses in autumn or winter, or early in spring, will strike root readily, but they will not strike so readily in summer : when rooted, they should be potted singly in small pots, and set in a close frame, and must be hardened to the air by degrees." (Bot. Cult, 186.)
394. Styphelia. A name derived from $\sigma \pi u p o s$, dense, in allusion to the compact habit of the genus. Erect

2299 The only species
2300 Lobes of leaves linear entire oblong, Flowers panicled terminal, Cor. tubular twice as long as cal. 2301 Plant smaller than the last, Leaves very narrow, Cor. short blue

2302 Stem half shrubby, Leaves sessile ovate acute pubescent
2503 Stem half shrubby, Leaves subsessile linear toothed spinous
2304 Leaves in fours linear sessile erect, Flowers clustered hidden among the leaves
2305 Leaves fleshy dark-green glabrous obovate, Stem ascending
2306 Sepals acuminate as long as tube of cor. Leaves cucullate subsess, with a recurved end longer than base 2307 Sepals acum. as long as tube of cor. Lvs, conc. their base longer than spreading point, Spike flow, at base 2308 Cor, cylindrical 4 times as long as cal. Flowers pendulous, Leaves acuminate flat
2309 Flowers nodding, Leaves lanceolate erect imbricated with a callous obtuse end, Stamens included 2310 Leaves lanceolate acute erect above flat beneath convex, Cal. obtuse as long as tube, Stamens exserted 2311 Sepals obtuse as long as tube of cor. Leaves cucullate acute spreading, Spike flowering at end

2312 Leaves long lanceolate attenuated at end, above concave smooth at edge, Branches pubescent
2313 Leaves obovate oblong obtuse mucronate flat smooth above roughish at edge, Flowers spreading
2314 Leaves oblong lanceolate flat glaucous smooth, Branches smooth, Flowers corymbose, Ped. 1-i3-flowered
2315 Leaves linear obovate mucronate rough above revolute at edge, Flowers nodding
2316 Leaves ellipt. lanceolate concave with a short callous pnint, Segm, of cor. smooth
2317 Prostrate much branched, Leaves lanceolate linear convex above ciliated at edge
2318 Anthers connate bearded, Cal. colored, Leaves long acuminate
2319 Leaves spreading with a flat point
2320 Cor. monopetalous, Tube entire as long as cal. Leaves ovate acuminate spreading
2321 Leaves sessile cordate acuminate pungent recurved, Cal. imbric. as Jong as narrow tube of cor.
2322 Spikes erect subterminal aggregate or axillary solitary, Leaves ellipt. oblong 4 times broader than long 2323 Spikes axillary few-flowered nodding stalked, Leaves oblong acute flat mucronate

and Miscellanenus Particutars.
branched shrubs, natives of New Holland, with scattered mucronate leaves, and axillary, nodding, very showy flowers. Culture as for Andersonia.
395. Lissanthe. A New Holland genus of shrubs with small white flowers, the segments of which are smooth, not bearded as in Leucopogon, to which the genus is next. From this difference its name has been contrived; Auroos, smooth, and avitos, a flower.
396. Astroloma. From oşoy, a star, and $\lambda \tilde{\omega} \mu \alpha$, a fringe, in allusion to the stellate disposition of the little bundles of hairs at the bottom of the tube. A genus of neat little bushes, with axillary erect fowers. Culture as for Andersonia.
397. Sprengelia. So called in honor of Curt Sprengel, professor at Halle, in Saxony, a learned man and respectable botanist. His Historia Rei Herbariæ is a monument of industry and information. This is a handsome half-hardy genus, delighting in a shady aspect, sandy peat soil, and dry bottom. They must be watered sparingly when not growing freely. Cuttings root in sand under a bell-glass.
398. Andersonia. Named by Mr. Browne, first, after William Anderson, a navy surgeon, who died in Cook's last voyage; secondy, after Dr. Anderson, formerly director of the botanical garden, St. Vincents; and lastly, after William Anderson, the curator of the apothecaries' garden, Chelsea. According to Sweet, this genus "grows freely in a sandy peat soil with the pots well drained; and care should be taken not to over-water it, as they are very liable to get sodden, when they seldom recover. The very young tops put in for cuttings, under a bell-glass in sand, will root readily. When first potted off, they should be put singly in small thumbpots, and kept close in a frame for a few days, and hardened to the air by degrees." (Bot. Cult. 133.)
399. Lysinema. Perhaps derived from $\lambda v \sigma 15$, a separation or solution, and vnese, a stamen; but the application of the name is not obvious. Shrubs with the habit of Epacris. They prefer rough turfy soil, and cuttings root readily in sand under a bell-glass.
400. Monotoca. From royos, one, and rozos, birth, because only one ovulum is borne by the ovarium, a remarkable circumstance in the natural order of the genus. The species are little shrubs, with axillary or terminal spikes of white flowers. They require well drained pots, and their cuttings must be taken off when very young, and planted in sand under a bell-glass.

History，Use，Propagatzon，Culture，
401．Leucopogon．From $\lambda \varepsilon u x \circ 5$ ，white，and $\pi \circ \gamma \omega v$ ，a beard，because the segments of the white flowers are bearded．A very extensive genus of small shrubs，with spiked axillary or terminal flowers．Culture as for Andersonia．
402．Stenanthera．From orevos，narrow，and $\alpha v 9$ neoc，an anther；the anther being in this genus not so broad as its filament．A bush with pine－like leaves，and erect large scarlet blossoms．Culture as in Andersonia．
403．Azalea．From «ॅ«גzos，dry，arid；either in allusion to the places where the plant grows，or to the brittle dry nature of its wood．This is a very ornamental genus，from its abundance of flowers of almost all colors，and the fragrant smell of most of the species．A．indica is the most delicate，but flowers well in a moist heat in rough peat well drained．According to Sweet，＂it thrives best in a sandy peat，and the pots to be well drained with small pieces of potsherd：it should be set in an airy part of the greenhouse in winter，and great care must be taken not to over－water it：in summer it should be exposed to the open air，but not in a very sunny situation．Young cuttings taken off close to the plant，and planted in pots of sand，will root readily，if plunged in heat under a bell－glass．＂（Bot．Cult．144．）T．Blake keeps his plants＂in peat and leaf－mould， always in the greenhouse till they are in a flowering state，and then he removes them to the hothouse，the sudden heat causing the blossom to open the better．＂（Hort．Trans．iv．133．）J．Narro uses the most fibrous part of peat－earth and sand；he places them in a considerable heat，and always in the shade，and when the plants exhibit blossom buds in March，he then raises the temperature from $50^{\circ}$ to $60^{\circ}$ ．This species strikes by cuttings of the young wood，taken off close to that which is ripened，planted in pots of sand，and plunged under a bell－glass．
The hardy Azaleas are best grown in compartments or groups by themselves，or with other American or European plants requiring a moist peat soil，and rather shady situation．Where peat is not to be had，the

2324 Spikes nodding aggregate, Ovaries 2-celled, Drupes oval, Leaves lanceolate flat 3-nerved 2325 Spikes axillary close together 3 -4-flowered, Leaves obl. lin. moderately spreading mucronate 2326 Spikes axillary and terminal spreading stalked longer than the leaves, Leaves cordate stem clasping 2327 Flowers subsessile solitary or 2 together, Leaves divaricating lanceolate linear bristly pointed

2334 Naked flowered, Leaves oblong slightly pubescent on both sides, Flowers small not viscid, One scgment of corolla linear 4 times as long as the others
2335 Branches hispid, Leaves same color on both sides with the nerve hispid, Cal, teeth very short round

2336 Branches smooth, Leaves small oblanceolate mucronate coriaceous with a hispid nerve, Flowers viscid 2337 Branches hispid, Leaves acute smooth on both sides glauc. beneath with a hispid nerve, Fl, very viscid 2338 Branches upright very hispid, Leaves long lanceolate hispid above, Flowers very viscid

2339 The only species
2340 Leaves long narrow entire with a brown edge

## 2341 The only species

and Miscellancous Particulars.
next best soil is a soft black sandy loam with leaf-mould, or mould from any decayed vegetable matter unmixed with animal remains, as the mould of decayed thatch, or the sweepings of stack-yards, wood-piles, \&c. Seeds are obtained from many of the sorts, and should be sown in pans or shallow wide pots thinly covered, placed in a shady situation, and kept moderately moist. When fit to transplant, they should be pricked into other pots, and placed under a glass, and shaded till they have struck roots afresh. They may then be hardened by degrees, and, when their roots fill the pots, planted out in beds, or where they are finally to remain. Most of the hardy Azaleas are well adapted for growing in pots, and for forcing early in spring. The deciduous sorts flower better than those which are subevergreens.

By intercrossing with Azalea and Rhododendron, some new and curious varieties or hybrid species have been produced, especially in Colvill's nursery, under the direction of Mr. Sweet : and from some thousands of seedlings which have not yet flowered, many more are expected. (See Encyc. of Gard. part II. b. i. ch. viii. sect. 7. The juice in the bottom of the flower of A. pontica is poisonous, and communicates its bad properties to the unwholesome honey of Pontus. Several fine varieties of the Azalea indica have lately been brought to this country; but many of the best varieties are still among the desiderata of English cultivators.
404. Chameledon. From $\chi \alpha \mu \infty$, dwarf, and $\lambda \varepsilon \delta \delta \nu$, a kind of cistus. This has been formed from the well known Azalea procumbens of Linnæus, one of the most interesting of our nerthern plants.
405. Brexia. So named by Noronha, perhaps from $\beta \varrho \in \varsigma \vdash \varsigma$, rain, in allusion to the protection afforded by the fine large leaves of the genus against rain. Fine stove plants with firm, spiny, or entire leaves, and axillary green flowers. In the garden they are commonly called Theophrastas.
406. Ophiorhiza. From opss, a snake, and $\dot{p}\langle\delta \%$, a root, from the use which is made of the roots in the East Indies for curing the bites of dangerous snakes. Mungos is an Indian name. A pretty stove plant, whose white flowers are well relieved by the dark red back ground of the calyxes and pedicels.

History, Use, Propagatior, Culture,
407. Allamanda. In memory of Dr. Frederick Allamand, a professor of natural history in the university of Leyden, who went to Guiana about 1769, and to Russia about 1776, and sent descriptions, figures, and specimens of plants to Linnæus. It is a milky shrub, of cathartic qualities; flowers freely, and strikes with ease in a moist heat.
408. Theophrasta. Theophrastus was born at Eresus in Lesbos, 310 years before Christ, and died at the age of 83. Linnæus has justly termed him the prince of botanists. The genus which has been selected to commemorate his name, is a curious prickly-leaved, low plant, native of St. Domingo, where it is called by the negroes wild cocoa. In the collections of this country it is rare, and no means has yet been discovered of propagating it, except by seeds.
409. Clavija. Named in honor of Joseph Clavijo Faxardo, a Spanish naturalist, who translated into his own language the works of Buffon. A fine genus of plants, exceedingly rare both in gardens and herbaria.
410. Vinca. From vinculum, a bond, in allusion to its twining shoots. The origin of its English name is, however, quite unknown. The Anglo-Saxons called it peruince; the English, periwinkle; the French, pervenche. This is a genus of well-known little shrubs, valued for their early and long continued flowering, and the hardy species as being evergreens which thrive under the shade and drip of trees, V. minor and major, like other plants which run much at the root, very rarely produce seeds. V, rosea is continually in flower, and is easily propagated by cuttings under a hand-glass.
411. Nerium. From vneos, damp, the plant growing upon the borders of rivulets, in the suuthern parts of Europe. This is a genus of beautiful evergreen shrubs of easy culture and propagation, and free fowerers great part of the year. N. tinctorium affords a blue equal to that of indigo, and it is thought by Dr. Roxburgh might be cultivated for that purpose,

N . oleauder is very common in the Levant, anil especially in the Isle of Candia, and in Sicily, Magna Græcia,

2342 The only species. Leaves 4 together subsessile ovate oblong, Flowers in villous fascicies
2343 A small prickly-leaved bush without branches and with terminal clusters

## 2344 Leaves very long lanceolate retuse toothed spinous

2345 Stems herbaceous prostrate, Leaves oblong lanceolate smooth, Flowers stalked, Cal. ciliated
2346 Stems procumbent, Leaves ellipt. lanc. smooth at edge, Flowers stalked, Teeth of cal. lanceolate

2347 Stems nearly erect, Leaves ovate ciliated, Flowers stalked, Teeth of calyx setaceous elongated
2348 Stem herbaceous erect square, Leaves lanceolate, Flowers twin or solitary stalked
2349 Stem erect, Flowers twin sessile, Leaves ovate oblong, Stalks 2-toothed at the base

2350 Leaves lin. lanc. 3 together ribbed beneath, Sepals squarrose, Nect. fiat 3-toothed

2351 Leaves linear lanc. 3 together, Corona filamentose, Anthers at end feathery

2352 Leaves ovate oblong shortly acuminate smooth, Corymbs terminal, Tube of cor. 6 times as long as calyx
2353 Leaves obl. lancenl. subacuminate smooth, Corymbs terminal, Tube of cor. 4 or 5 times as long as calyx
2354 Leaves ellipt. lanc. and ovate acum. smooth, Branches and corymbs divar. Tube of cor. twice as long as cal.
2355 Stems sarmentose, Leaves oblong, Pedunc. 2-flowered
2356 Pedunc. many-flowered, Cor. cylindrical hairy outside, Leaves ovate mucronate pubescent beneath
2357 Pedunc. racemose, Leaves lanceolate acuminate, Follicles torulose very long
2358 Pedunc. umbelled, Leaves ovate obtuse mucronate
2359 Leaves oval lanceolate acute at base the lowest linear, Flowers in fascicled corymbs
2360 Prickles two extra-foliaceous, Leaves lanceolate sinooth, Cor. hypocrateriform
2361 Panicle terminal, Cal. spreading as long as corolla, Leaves ovate mucronate
2362 Stem erect rounded, Leaves oval acuminate smooth, Flowers terminal in threes
2363 Stem erect angular, Leaves ovate lanceolate obsoletely crenate, Corymbs axillary dichotomous
2364 Leaves ovate lanceolate entire strongly marked with crimson veins
2365 Stem erect shrubby, Leaves lanceolate oval, Cor. acute, Throat villous

and Miscellancous Particulars.
\&c. by rivers and torrents : the leaves are acrid and poisonous. Young cuttings planted under a hand-glass, and placed on a little heat, root freely.
N. odorum and its varieties, though treated as a greenhouse plant, requires a stove to make it flower freely.
412. Wrightia. Named after Dr. William Wright, a Scotch physician, who resided some years in the West Indies at the end of the last century, and the author of one or two botanical tracts. W. antidysenterica is reputed to be a specific in the dysentery. The wood is well adapted for the turner, and to make cabinets and other elegant furniture. It is very white, and of a fine grain like ivory, only much lighter. It mixes admirably with ebony.
W. zeylanica is an elegant branched shrub, with whitish yellow flowers and an agreeable odor. Both species may be treated like Nerium.
413. Echites. A name employed by Pliny as the designation of a kind of Clematis; it is derived from $\varepsilon \chi 65$, a viper, on account of the twisting nature of its shoots. This is a genus of plants somewhat singular in habit, with opposite, veined, shining leaves, and flowers in peduncles void of scent. They all flower freely, and root readily under a hand-glass in sand.
E. biflora supports itself partly by stems, and partly by twining on trees, hence frequently acquiring the air of a tree. It grows in salt marshes.

E suberecta climbs: when it grows in savannahs it does not rise above three feet, and sometimes not more than one foot high.
E. sanguinolenta is remarkable for the beauty of its foliage, the veins of which are stained with crimson.
414. Ichnocarpus. From ichnos, a vestige, and carpos, fruit. Climbing shrubs of Sierra Leone and the East Indies, with long branches covered with smooth entire leaves, and white sweet-scented flowers. Cuttings root freely in sand under a hand-glass.

Boxthorn-leav. 蒌 silvery-leaved

Sp. 1. N. Spain 1813. S r.m Bot. reg. 92

History, Use, Propagation, Culture
415. Plumieria. So named by Tournefort, in honor of Charles Plumier of Marseilles, a Franciscan friar, who travelled into South America. He is distinguished for the accuracy of his observations, and for the fidelity of his drawings, which are the only representations of many of the most curious plants of the West Indies and South America. His drawings of flowers have seldom, even in these days of pictorial excellence, been equalled. He was the author of Plantæ Americanæ, 1693, and other excellent works. This is a fine flowering genus. "It succeeds best in a light loamy soil, and requires but little water. Large cuttings taken off and laid to dry for a considerable time, may be stuck in the $\tan$ in a moderate heat, or planted in pots, and they will root freely; they must not be covered with a glass, or it will rot them. To have the plants flower well, they should be kept very dry when not in a growing state, which will throw them into bloom." (Bot. Cult. 95.)
416. Strophanthus. From $\sigma \tau \varrho \varrho \Phi \omega$, to turn or twist, and ay 905 , a flower; in allusion to the manner in which the segments of the corolla are twisted together before expansion. A most beautiful genus of tropical shrubs, with bright yellow flowers more or less spotted with red. They require the same treatment as Echites.
417. Cameraria. So named by Plumier, from Joachim Camerarius, a physician and botanist of Nuremberg, who was born in 1534, and died in 1598. He published an edition of Matthiolus, in Latin and German, with new figures, and many observations; but the most celebrated man of the name was Ralph James Camerarius, a German botanist, who published in 1719 , a tract, in which the first principles of the arrangement of plants by their seeds were propounded. This is a fine flowering genus, of easy culture, and cuttings root freely under a hand-glass in a pot of sand.
418. Tabernamontana. So named by Plumier, in memory of James Theodore, surnamed Tabernæmontanus, from Berg-Zabern, the place where he was born. He published "Krauterbuch," and figures of plants in 1589-90; was physician to the Elector Palatine, and died in 1590. This is a genus of easy culture but little beauty. All the species root in sand under a hand-glass.
419. Amsonia. So named by Clayton in his Flora Virginiana; referred to Tabernæmontana by Linnæus, now separated again. These are pretty plants, which grow in any soil; and may be propagated by cuttings under a hand-glass, or dividing at the root.
420. Cerbera. A poetical name formed in allusion to the mythological dog Cerberus, whose bite was poison. ous, as is the juice of this genus. Ahouai and Manghas are vernacular names of the countries where the spe-

# 2366 Leaves ovate oblong flat, Leaf stalks with two glands 

2367 Leaves scattered lanceolate acute, Flowers corymbose terminal
2368 Leaves lanceolate revolute, Peduncles tuberous above
2369 Leaves lanceolate stalked obtuse
2370 Flowers always with the limb closed very sweet-scented
2571 Leaves oblong acuminate flat at edge, Cor. white and yellow
2:372 Leaves ollong acute, margins flat veiny, Cor. tube red, throat yellow, limb white
2373 Branches dichotomous, Leaves mucronate-acuminate, Cor. infundibuliform
2374 Leaves rounded ovate acuminate at the base transversely striated, Flowers terminal corymbose 2375 Leaves ovate oblong netted, Umbel stalked few-flowered, Flowers large yellow sweet (C. lutea.) 2376 Leaves ovate lanceolate wavy, Corona 10 -cleft : alternate segm, shorter obtuse
2377 Leaves linear
2378 Leaves ovate, Flowers lateral in clustered umbels
3379 Leaves ovate, Peduncles few-flowered, Stamens included
2380 Leaves lanceolate ovate, Branches divaricating
2381 Leaves oval lanceolate, Stamens longer than tube of corolla
2382 Stem smoothish, Leaves oval lanceolate the upper acuminate beneath a little hairy
2383 Stem smooth, Leaves linear lanceolate acute at each end quite smooth
2384 Leaves narrow lanceolate close erect pubescent, Stem obviously pubescent
2385 Leaves ovate acute
2386 Leaves lanceolate, Nerves transverse
2387 Leaves lanceolate attenuate at each end vemy spotted, Cymes axillary branched
2588 Leaves ovate scattered subsessile, Flowers terminal about 5
2389 Leaves linear very long, Flowers subsolitary axillary, Fruit roundish
2390 Dichotomous, Leaves broad lanceolate, Corymabs terminal, Drupes obliquely cup-shaped gaping

## 2391 Leaves obovate scabrous very large whitish beneath

2392 The only species. A pretty stove annual

2393 Prickly, Leaves lanceolate obtuse acute at base attenuate smooth
2394 Leaves obovate lanceolate beneath silky, Peduncles axillary clustered

and Miscellaneous Particulars.
cies so called are found. Thevetia is named after Andrew Thevet, a French monk, who travelled in Brazil about 1530. C. Ahouai has thick succulent leaves about three inches long, and near two broad, of a lucid green, smooth, and very full of a milky juice, as is every part of the shrub. The fowers are in loose bunches at the ends of the branches, and are succeeded by nuts, the kernels of which are a most deadly poison. The wood stinks abominabiy, and is not used even by the Indians for fuel. They put small stones into the empty nuts, string them, and fasten them about their legs when they dance.
C. Manghas is a milky tree with broad lanceolate leaves a foot in length; flowers in terminal racemes, and the drupe ovate, the size of a goose's egg, inclosing two seeds resembling two large chestnuts, poisonous and emetic.
C. Thevetia is an elegant shrub or small tree, with acuminate leaves, and large, specious, nodding, yellow, sweet-smelling flowers. The fruit is a green drupe, containing a nut with a single kernel in it. Cuttings of all the species strike very readily in sand under a hand-glass.
421. Tectona. Altered by Linnæus from Tekka, its name in Malabar. This is a timber-tree of immense size and great durability, and is justly called the oak of the east. The trunk is erect, and the bark ash-colored; the leaves are obovate, downy underneath, and on young trees from 12 to 24 inches long, and from 8 to 16 broad. The flowers are in panicles, small, white, and fragrant. The seeds are lens-shaped in t-celled drupes. The tree abounds in the vast forests of Java and Ceylon, Malabar, Coromandel, \&c., and especially in the empires of Birman and Pegu. The wood has, by long experience, been found to be the most useful in Asia. It is easily worked, and at the same time both strong and durable. It is considered superior to all others for shipbuilding. Calcutta and Madras draw all their supplies of wood for ship-building from the teak forests of Ava and Pegu. Some of the finest vessels that have ever arrived in the Thames have been of teak tree, built in Bengal. The tree was introduced to the British possessions by Lord Cornwallis, and is now planted with a view to timber in the mountainous parts of Bengal. In our stoves it thrives in loam and peat, and ripened cuttings root freely in sand under a hand-glass.
422. Caldasia. A pretty stove herbaceous plant, with handsome small blue flowers. It was named by Willdenow, after the MSS. of Baron Humboldt, in honor of Joseph Caldas, a meritorious Spanish botanist, residing at Popayan in South America. It may be propagated by cuttings.
423. Bumelia. A name given by the Greeks to our common ash. Swartz applied the name to this West Indian

History，Use，Propagation，Culture，
genus．These are plants with good foliage，but no beauty of blossom．Some of the species are robust enough to bear our winters in the open air；but they are rather tender，and require to be placed in a sheltered situation or against a warm wall，and covered with mats during winter．Cuttings root in sand under a hand－glass．The stove species are low West Indian trees，and known there under the name of Bully tree．They thrive well in loamy soil，or loam and peat，and cuttings will root，but，according to Sweet，＂not freely，in sand under a hand－glass，＂being well ripened before they are taken off．
424．Chrysophyllum．From $\chi e v \sigma \sigma s$, gold，and $\varphi u \lambda \lambda \alpha v$, a leaf；all the species having their leaves covered on the under surface with dense shining hairs of a bright yellow or white color．C．cainito has large elegant leaves， ferruginous underneath；it forms a tree of considerable size，with slender flexible branches．The leaves and fruit，like the Achras，to which the tree is very nearly allied，are full of milk，which the fruit retains even in the most perfect state．This milk is rough and astringent before the fruit ripens；but when it grows to full perfec－ tion，it becomes sweet and gelatinous，with an agreeable clamminess．Being mixed with a small quantity of orange juice，it binds the body extremely．The tree is of general and easy culture in Jamaica，and is here grown chiefly for its foliage．Sweet says，ripener shoots of all the species taken off and planted in sand，will root under a hand－glass with a strong moist heat．
425．Sideroxylon．From $\sigma \delta \delta$ ngos，iron，and $\xi u \lambda o v$, wood；in allusion to the hardness of the wood．The specific
 heavy as to sink in water．It grows well in loam and peat；and cuttings somewhat ripened may be struck in sand under a hand－glass．
426．Jacquinia．So named by Linnaus，in honor of James Nic．Jos．de Jacquin，professor of botany at Vienna， born at Leyden，in 1727，author of many splendid works．A noble genus，well devoted to perpetuating the memory of one of the first of botanists．The name of one of the species armillaris，（from armilla，a garland，） has been applied in consequence of the shoots being used by women in America as garlands．This beautiful genus requires some care in propagation，but is of easy culture in the bark－stove，in loam and peat，and with a moist heat．＂Cuttings，＂Sweet observes，＂will strike root with ease in sand，under a hand－glass，in heat．＂

427．Achras．The Greek name of the wild pear．The root of the word has been thought to have been found in $a c$ ，the Celtic for a point，in allusion to the many stout spines with which the tree is covered．The word Sapota，applied to one of the species，is derived from its Mexican name Cochit－zapotl．This is a genus of fruit－ bcaring timber－trees，chiefly natives of the West Indies．A．mammosa，or American marmalade，grows in America to the height of 35 or 40 feet，having a straight trunk covered with an ash－colored bark．The branches form a regular head；the leaves a foot in length，and near three inches broad in the middle．The flowers are

2395 Leaves lanceolate ovate acuminate, Peduncles clustered axillary and lateral
2396 Leaves terminal oblong lanceolate sinooth wavy at edge, Branches lax
2297 Spiny, Branches spreading pubescent, Leaves oval lanceotate smooth above beneath woolly
2398 Spiny bushy loosely reclinate, Sterile branches divaricate divided, Leaves small obovate smooth
2399 Unarmed, Leaves evergreen oblong lanceolate acute at each end prickly serrate, Berries large
2400 Leaves rounded edged veiny coriaceous smooth on both sides
2401 Leaves ovate with parallel veins beneath tomentose shining
2402 Leaves falcate ovate beneath downy shining
2403 Leaves oblong acuminate beneath downy gold color, Fruit ovate 1-seeded
2404 Leaves ovate oblong smooth on both sides, Fruit elliptical smooth
2405 Leaves oblong ovate obtuse, Flowers lateral and axiliary
2406 Leaves wedge-shaped, Branches at the ramifications nodose whorled
2407 Leaves obovate lanceolate acuminate pungent
2408 Leaves lanceolate acuminate

2409 Flowers solitary, Leaves cuneiform lanceolate
2410 Flowers solitary, Leaves lanceolate ovate
2411 Brachiate diffuse, Fruit rounded with the mucro of the hilum shorter
2412 Leaves ovate smooth above, Corymbs lateral, Calyxes 10 -striated
2413 Leaves roundish ovate toothed veiny scabrous, Corymbs axillary moncecious
2414 Leaves ovate subcrenate subrepand rough, Cal. cylindrical shorter than the tube
2415 Leaves lanceolate ovate rough, Panicle terminal, Cal, tomentose 10 -striated
24.16 Leaves ovate villous a foot and half long

2417 Leaves oblong ovate entire, Flowers corymbose, Cal. downy inside
2418 Leaves in 3 s ovate oblong acuminate, Branches nodose hispid, Cal. bearded
2419 Leaves oblong attenuated at the end entire coriaceous, Racemes comp. diffuse
2120 Leaves oblong lanceolate smooth on each side the upper serrate, Branches pilose
2421 Leaves lanceolate linear acuminate hoary beneath, Pedunc. lateral axillary naked
2422 Leaves ovate on long stalks, Stalk above the base bent inwards and jointed, Cor. hypocrateriform

cream-colored, and are succeeded by large oval or top-shaped fruit, covered with a brownish skin, under which is a thick pulp of a russet-color, very luscious, called natural marmalade, from its likeness to marmalade of quinces. It is commonly planted in gardens for the fruit in Jamaica, Barbadoes, Cuba, and most of the West India islands. In this country it has been hitherto grown only as a part of botanic collections, but some attempts have been lately made to cultivate it as a stove fruit, and we have no doubt they will be attended with success. "Cuttings root readily in a pot of sand plunged in heat, under a common hand-glass. The cuttings should be taken off as near the stem of the plant as possible, not being so apt to rot as when cut off in the middle of the shoot. No leaves should be taken off or shortened above the sand." (Sweet.)
A. sapota is a large, tall, straight tree, without knots or branches, for twenty feet or more. The head spreads into many small branches; the bark is dark-grey and full of cracks; the fruit is bigger than a quince, round, and covered with a thick grey rind, yellow when ripe. The flesh is as yellow as a carrot, with two stones the size of almonds, of a rich smell and taste. The variety called the Naseberry has fruit as big as a bergamot pear, and similarly shaped. When it is green or first gathered, the juice is white and clammy, and will stick like glue ; then the fruit is hard; but when it has been gathered two or three days, it grows soft and juicy, and then the juice is clear as spring-water and very sweet; in the midst of the fruit are two or three black stones or seeds, about the bigness of a pompion seed. It is esteemed an excellent fruit in the West Indies. In our stoves it is propagated like the mammee tree.
428. Cordia. So named by Plumier after E. Cordus, a German botanist of the 16th century. Valerius Cordus, his son, was born in 1515, and died in 1544. He left a History of Plants, and was the author of some Observa tions upon Dioscorides. Sebestena, the name of a species, is sebestân in Persian. Myxa is derived from $\mu \nu \xi$, a viscidity, on account of its viscid mucous juice, which is used for glue in the cast. Geraschanthus, from, $\gamma$ 多 $u \sigma \approx \omega$, to grow old, and ay-qos, a flower, is in allusion to the long duration of the flowers; collococca, ( $\approx o \lambda \lambda n$; glue, and zoxzos; glutinous fruit) in allusion to the frust. This is not a delicate genus, but flowers freely. The timber of C. myxa is tough and solid, and used in the east for procuring fire by friction. The leaves bruised with those of Datura metel are applied to the forehead in the headach; children eat the fruit, from which also a glue is prepared. C. sebestena is very ornamental, on account of its large, tubular, scarlet flowers; the most beadtiful and agreeable, says Browne, of any I have seen in America. A small piece of the wood put on a pan of lighted coals, will perfume a whole house. From the juice of the leaves, with that of a species of fig, is prepaded the fine red color with which they dye their clothes in Otaheite. Poultry in the West Indies feed on the berries of C, collococca, which is there called the clammy cherry, or Turkey berry-tree. All the species grow readily in loam and peat, and cuttings strike in sand, under a glass, in heat.
429. Varronia. Named after Marcus Terentius Varro, a most learned Roman, born 116 years before Christ,

## History, Use, Propagation, Cullure,

and lived a hundred years. The work he left upon the agriculture of his time is invaluable. In French a species is called Monjoli, (my beauty) on account of its beauty.
430. Ehretia. So named by Linnæus in honor of D. G. Ehret, a famous French botanist and draughtsman. He made all the drawings for Patrick Browne's History of Jamaica; and a large collection of his drawings is now extant in the Banksian collection. Large trees of the Tropics, with handsome foliage and white flowers, which are not often produced in Europe.
431. Bourreria. A genus divided from Ehretia, with which it nearly agrees. It was named after one Bourer, an apothecary at Nuremberg.
432. Ellisia. Joseph Ellis was an English naturalist, fellow of the London Royal Society, and correspondent of Linnæus. He published, besides his Natural History of Corallines, many papers in the Transactions of the Royal Society.
433. Sersalisia. Named after John Baptiste Sersalis, a Neapolitan clergyman, much praised by Fabius Columna. Culture the same as for Sideroxylon.
434. Manglilla. This genus is called in Dombry's Manuscript Papers, from which M. de Jussieu obtained his knowledge of it, Manglille de Perou. The original species was a Peruvian shrub, with alternate leaves and bunches of numerous axillary fowers.
435. Ardisia. A name derived from afdrs, a point, on account of the acute segments of the corolla. An ornamental genus of plants, much valued by collectors for the beauty of their foliage, flowers, and berries, They are of easy culture : cuttings strike root freely in a pot of sand, plunged in a moist heat, under a handglass.
436. Arduina. In honor of Pietro Arduini, curator of the economical garden of Padua. A genus scarcely distinct from Carissa. It is a pretty little plant not unlike the box, easily propagated by cuttings under a bellglass in sand,
437. Strychnos. A name given by the Greeks to the Solanum. The root of the name has been found in the verb seaw, to strew, to throw down ; the property of the original and modern plants being narcotic. S. nux-vomica is a middling sized tree with a crooked trunk and smooth ash-colored bark ; the leaves round, shining, smooth,

2423 Leaves broad ovate serrate rugose, Spikes terminal, Flowers clustered, Cal. large inflated
9424 Leaves linear toothed obtuse revolute at edge rough above tomentose beneath, Spikes linear oblong
2425 Leaves oblong ovate entire smooth, Flowers panicled
2426 Leaves ovate roughish, Flowers corymbose spiked 1-sided
2427 Leaves ovate entire smooth, Flowers corymbose, Cal. smooth
2428 Leaves ovate very smooth reflexed at edge, Berry juiceless 4 -cornered
2429 The only species, resembling a Hydrophyllum
2430 Leaves ovate obtuse downy beneath, Cor. villous outside, Barren filaments lanceolate
2431 Leaves oblong acute at each end, Flowers solitary lateral
2432 Panicles axillary and terminal, Leaves oblong acuminate narrowed at base
2432 Corymbs axillary 3-parted, Leaves oblong narrowed towards each end
2434 Panicles terminal, Leaves lanceolate ovate repand crenate acuminate attenuated at base
2435 Racemes lateral axillary compound, Leaves oblong acuminate entire
2456 Corymbs axillary simple, Leaves entire ovate elliptical coriaceous
2437 Leaves oblong entire coriaceous shining, Pan. terminal, Sepals rounded, Cor. thrice as long as cal
2438 Leaves oblong entire coriaceous shining, Pan. terminal, Sepals round, Cor. twice as long as calyx
2439 Racemes axillary simple, Leaves obovate at the edge cartiliginous scrrated
2440 Leaves wedge-shaped oblong nearly sessile entire smooth reflexed, Panicles decompound
2441 Raceme terminal pyramidal, Pedunc, altern, umbelliferous, Leaves oblong obtuse smooth entire
2442 Leaves lanc, crenate, Corymbs compound, Flowers spotted
2449 Leaves lanceolate coriaceous sinuate narrowed towards the base, Cor. campan. dotted: Lobes obtuse
2444 Flowers panicled, Leaves oblong entire veinless coriaceous
$2+45$ Leaves cordate ovate mucronate subsessile, Spines bifid at end
2446 Unarmed, Leaves ovate stalked, Cymes subterminal
2447 Leaves opp. ovate acute 5 -nerved veiny, Cymes axillary

C448 Leaves ovate mucronate netted veiny, Segm. of cor, lanceolate 2449 Leaves ovate acute veiny, Segments of cor. oblong

2450 Leaves cordate lanceolate, panicles short opp. few-flowered, Bractes very small

and Miscellancous Particulars.
entire; and the berry the size of a pretty large apple. The wood is hard, durable, and very bitter. The seeds, which form the officinal nux-vomica, are employed in the distillation of country spirits, to render them more intoxicating. The pulp of the fruit seems perfectly innocent, being eaten greedily by many sorts of birds. The seed consists chiefly of a gummy matter with a little resin, the latter intensely bitter. It is reckoned amongst the most powerful poisons of the narcotic kind. It proves fatal to dogs in a very short time, and to most other quadruped vermin, and even some birds, as crows and ducks From dissections both of the human subject and of dogs that have been poisoned by it, no injury appears done to the stomach or intestines, which proves that it acts upon the nervous system, and destroys life by the virulence of its narcotic influence.
$S$. potatorum is a larger tree than the other. The pulp of the fruit when ripe is eaten by the natives : the ripe seeds are dried and sold in every market of the East Indies to clear muddy water. A precious quality in countries where the water is rarely of a good quality. Hence the English name of clearing-nuts. The natives never drink clear well-water, if they can get pond or river water, which is always more or less impure. One of the seeds is rubbed very hard for a minute or two round the inside of the vessel containing the water, which is generally an unglazed earthen one, and the water left to settle; in a very short time the impurities fall to the bottom, leaving the water clear, and perfectly wholesome. These nuts are constantly carried about by the more provident part of our officers and soldiers in time of war, to enable them to purify their water; they are easier to be had than alum, and are probably less hurtful to the constitution.
438. Carissa. A word of no known meaning. Carandas is a slight alteration of Caraunda, the Bengalese name of the tree. C.Carandas is a small tree, with dichotomous branches, and entire, glossy, ovate leaves, fowers like those of Jasminum grandiflorum, and berries black when ripe, eatable, and of a sweet acid flavor. Cur-rant-jelly is made of them in the East Indies.
C. spinarum is a diœceous plant with horizontal branches, coriaceous glossy leaves, and terminal peduncles of five or six small flowers. Neither of the species require much water, and the pots should be well drained to prevent their getting sodden. Cuttings strike root freely under a bell-glass in sand plunged in heat.
439. Paderia. From pedor, stink, in allusion to the foetid smell of the flowers. A climbing smooth shrub, with opposite stalked entire leaves, and dull purple flowers.

History, Use, Propagation, Culture,
440. Gelscmium. One of the ancient names of the jasmine. A beautiful climbing evergreen shrub, rather too delicate to bear the cold of our winters; but with a little protection it produces in abundance its charming yellow flowers of delicious fragrance.
441. Rauwolfia. So named by Plumier, in honor of Leonhard Rauwolf, physican at Augsburg, who travelled through Palestine and other countries of the east, in 175:3-5. His travels were translated into English, under the revision of Mr. Ray, and with additions by him. The species abound in a milky juice, which is considered anore or less of a deleterious nature. They produce berries about the size and color of those of the privet. Cuttings root in sand under a hand-glass.
442. Vallesia. In honor of Fr. Vallesio, principal physician to Philip II., king of Spain. He wrote upon the plants of holy writ. Small Peruvian shrubs.
443. Bacobotrys. From Faios, small, and ßotevs, a bunch; the flowers growing in little bunches. An elegant shrub with white flowers, produced freely from the axilla of the leaves.
444. Solandra. In honor of the celebrated and excellent Daniel Solander, whose botanical merits will never be forgotten in this country. He accompanied Sir Joseph Banks in his voyage with Captain Cook, and the information afforded by his manuscript notes made at that time has not yet been exhausted. The species are very beautiful, and remarkable for the extraordinary size of their flowers. Sweet observes, "if allowed plenty of room and moisture, they grow very rapidly, but produce no flowers. The best way is to plant them in a loamy soil, and allow them to grow fast at first, till they have made a great many shoots; then keep them very dry till their leaves drop off, and they will produce plenty of flowers. Cuttings taken off and stuck in a pot of mould, will root without any further care. The best way to have plants flower young, is to take the cuttings from the flowering shoots." (Bot. Cult. 107.)
445. Cestrum. A name given by the Greeks to the Betony, but having no relation whatever to the plant which bears the name now. Cestreuu, Fr. This is a genus of easy cultivation, but of little beauty. The flowers are all white, and in some cases sweet-scented; the fruit of all poisonous.
446. Atropa. A mythological name. Atropos was one of the Fates, and it was her especial duty to cut the thread of human life. The fruit of this genus is well adapted to fulfilling her office. A. belladonna (fine lady) has

2451 Scandent quite smooth, Leaves lanceolate, Flowers axillary subsolitary

2452 Leaves 3 or 4 together lanceolate acuminate shining, Flowers terminal
2453 Leaves 4 together oblong ovate acuminate pubescent, Flowers terminal and axillary
2454 Leaves 4 together oblong narrowed both ways tomentose, Flowers terminal and axillary
2455 Leaves 3 together oblong acuminate smooth, Flowers between the petioles corymbose

## 2456 Leaves lanceolate cymbiform meurved at end

2457 Leaves oblong ovate acuminate coarsely serrated
2458 Leaves smoothish stalked, Anthers of the same shape
2459 Fiowers stalked, Segm. of flower long acuminate revolute
2460 Filaments toothed or naked, Leaves elliptical coriaceous shining, Flowers fascicled stalked
2461 Filam. toothed, Leaves ovate oblong acuminate smooth, Flowers fascicled sessile
2462 Filam. naked, Segm. of cor. emarginate, Flowers racemose, Leaves ovate and lanceolate
2463 Filam. toothed, Peduncles racemose as long as leaves
2464 Filam, toothed or naked, Flower-bearing stem panicled, Stipules linear
2465 Filam, naked, Stipules amplexicaule lunate, Leaves ovate, Flowers panicled terminal
2466 Filam. naked shorter than throat of cor. Flowers aggreg. sessile terminal and lateral, Leaves elliptical
2467 Filam. naked, Pedunc. elong. as long as leaves spiked at end, Leaves oblong, Stip. elliptical
2468 Filam. naked, Segm. of cor. rounded reflexed, Leaves lanceolate
2469 Leaves lanceolate oblong coriaceous, Flowers sessile
2470 Filam. toothed, Flowers racemose, Leaves linear lanceolate
2471 Flowers clustered sessile terminal, Branches leaves and calyxes downy
2472 Filam. toothletted, Spikes axillary longer than leafstalks, Leaves obl. pub. on both sides, Stip. falcate
2473 Filam. naked the length of the tube of the corolla, Flowers aggreg. sessile terminal, Leaves elliptical
2474 Filam. naked, Leaves lanceolate, Racemes short axillary and terminal, Cor, revolute
2475 Filam. naked, Leaves lanc. ovate, Racemes axillary and terminal, Flowers pedicellate, Cor. acum. reflex
2476 Filam. toothed, Leaves ovate acute wavy, Pedunc, axillary and terminal few flowered
2477 Filam. naked exserted, Flowers stalked clustered, Cor, campanulate, Leaves elliptical
2478 Leaves large ovate acute entire shining naked on both sides coriaceous nerved, Petioles black shining
2479 Stem herbaceous, Leaves ovate entire
2480 Stem shrubby, Peduncles clustered, Leaves cordate ovate obtuse
3481 Stem shrubby, Leaves oblong entire smooth, Branches downy, Sepals aristate
2482 Stem shrubby, Peduncles clustered, Cor, revolute, Leaves oblong
2483 The only species

and Miscellaneous Particulars.
its specific name, according to some, from its being used as a wash among the ladies, to take off pimples or other excrescences from the skin ; or, according to others, from its quality of representing phantasms of beautiful women to the disturbed imagination. The inspissated juice of the berries is used in the form of extract for anointing the eyelids in some opthalmic complaints. Its effect in dilating the pupil is quite remarkable. It has branch. ing stems with the root leaves often a foot long and five inches broad, and the whole plant is more or less tinged with purple. The flowers are void of scent; the berries are larger than cherries, at first green, but when ripe of a beautiful shining black color, full of purple juice, with roundish dotted channelled seeds. The whole plant, and especially the berries, is poisonous. Buchanan relates the destruction of the army of Sweno the Dane, when he invaded Scotland, by the berries of this plant, which were mixed with the drink which the Scots, according to truce, were to supply the Danes with. The Danes became inebriated, and the faithless Scots fell on them in their sleep. Dr. Milne (Indigenous Botany) remarks, that nature has been more parsimonious in her warnings with respect to this plant, than to others of the same natural family. Neither the smell nor the taste is offensive; and if the color of the flowers proves in some degree a repellant, that of the fruit, on the other hand, is in an equal degree, at least, attractive and inviting.
447. Mandragora. From pasiga, something relating to cattle, and ajaugos, hurtful: dangerous to cattle. It is a venomous plant, and was an important engine in the days of medical charlatanry, from the roots being supposed to bear a resemblance to the human form. In old herbals the figures display the male mandrake with a long beard, and the female with a prolix head of hair. Miller says, " mountebanks carry about fictitious images, shaped from roots of bryony and other plants, cut into form or forced to grow through moulds of earthenware, as mandrake roots." Happily such mountebanks have ceased to exist in Britain. On the continent they are still common, and Box tells us (in 1810), that by means of a few cuts with a knife, they add the image of the exterior organs of generation, male or female, to mandrake roots, and then sell them to ensure boys or girls to pregnant women, procure happy births, \&c. We have ourselves seen them exposed by mountebanks in sea-port towns of France. For an ingeniously indelicate figure of a mandrake root, sce the Flora Greca, the plates for which have been all selected by Sir James Smith. The plant is of easy culture, but is the better for the protection of a frame or shelter of a south wall during winter.

## History, Use, Propagation, Culture,

448. Physalis. From quas, a bladder. The fruit is enclosed in an inflated calyx. The berries of $\mathbf{P}$. alkekengi are acidulous and slightly bitter; they were esteemed detergent and aperient by the ancients. In Spain, Germany, and Switzerland, they are eaten as a common fruit. Phy. peruviana produces a pleasant fruit for tarts, and is in some countries, and even English gardens, cultivated for that purpose
449. Saracha. A plant resembling Atropa, or Physalis, to which it is too nearly related. It was named by the authors of the Flora Peruviana after Isidore Saracha, a Spanish botanist.
450. Lycium. So called because the original species was a native of Lycia, a country of Asia Minor. Some of the Cape species of this genus have elegant flowers and merit cultivation, and $\mathbf{L}$ barbarum is valuable for covering naked walls, arbors, \&c. It grows four or six feet in a season, flowers freely, and is readily propagated by cuttings at any season of the year. L. europæum is used for hedges in Tuscany, being armed with small thorns. Clusius says they eat the small shoots in Spain with oil and vinegar. L. ruthenicum is an ornamental shrub from its very white bark. The greenhouse species root readily in sand under a hand-glass.
451. Solanum. By some ingenious commentators this word has been derived from solari, to comfort. The derivation may be possible, but the application is not evident. This extensive genus, which belongs to the Luridæ of Linnæus's system of natural orders, does not contain many handsome plants; but it includes, besides the Tomato and egg plant, celebrated in cookery, the potatoe, whose tubers, as a human food, if equalled, are not surpassed by those of any other plant. Some of the species are singular on account of their leaves and
452. Stem shrubby rounded, Branches upright, Flowers clustered

2485 Stem shrubby, Branches flexuose, Flowers clustered
2486 Stem shrubby, Leaves ovate tomentose
2487 Leaves in pairs repand obtuse subtomentose, Stem herbaceous panicled above
2488 Leaves ovate subrepand obtuse nearly naked, Flowers in pairs, Stem herbaceous
2489 Leaves in pairs entire acute, Stem herbaceous branching below
2490 Pubescent, Leaves cordate entire
2491 Pubescent, Stem angular, Leaves in pairs cordate nearly entire soft, Teeth of cal, acuminate
2492 Much branched, Branches angular smooth, Leaves ovate toothed
2493 Pubescent, Stem erect $\frac{1}{2}$ shrubby, Leaves subcordate toothed angular, Petioles decurrent
2494 Much branched, Leaves ovate cordate pub. Flowers pendulous, Calyx in fruit ovate acuminate angular
2495 Much branched, stalk of fruit much longer than the villous leaf
2496 Much branched, Leaves villous, Peduncles erect
2497 Much branched, Stem procumbent rounded hairy. Leaves rather fleshy
2498 Pubescent, Leaves ovate angular, Stem herbaceous, Berries viscid, Root tuberous
2499 Hairy, Leaves cordate acute toothed, Pedunc. at length reflexed, Cal. with segm. twice as short as cor.
2500 Leaves oval unequal acute toothed smoothish, Flowers solitary, Calyx powdered, Cor, tomentose
2501 Leaves in pairs toothed repand tomentose-viscid oval, Stem herbaceous panicled above
2502 Leaves in pairs unequal ovate smooth, Flowers in umbels
2503 Stem erect hairy, Umbels axillary stalked cernuous, Flowers plaited

2504 Branches diffuse spiny, Leaves linear fleshy attenuated at base fascicled, Pedunc, longer than cal
2505 Branches upright spiny, Leaves linear fascicled, Pedunc. shorter than calyx, Stam. as long as tube of cor.
2506 Branches droop. spiny, Lvs. lin, lanc. atten. at base fasc. Ped, longer than cal. Stam. as long as limb of cor.
2507 Branches drooping, Buds spiny, Cal. trifid, Stam. as long as limb of cor.
2508 Branches drooping spiny rounded, Leaves sessile lanceolate acuminate, Cal, trifid, Berry turbinate
2509 Branches lax spiny, Leaves oblong lanc. obtuse obliquely bent, Stam, shorter than limb of cor.
2510 Branches erect flexuose at end recurved rounded much spreading spiny, Leaves subsessile lanc, acute
2511 Stem and branc. droop. striated rarely spiny, Lvs. stalked ov. obt. Cal. 5-toothed, Style longer than stam.
2512 Spiny, Leaves obovate fleshy smooth, Peduncles very short
2513 Spiny, Leaves ovate entire acute glaucous, Flowers panicled
2514 Unarmed, Leaves narrow spatulate oblong, Flowers 4-cleft tetrandrous
2515 Erect spiny, Branc, dif, angular, Lvs, stalked lanc. acute, Cal. 2 or 3-fid, Style scarcely longer than stam.
81. Lycopersicon (Love Apples.) Anthers conical, joined at end. Berry many-celled.

2516 Villous hoary, Leaves stipulaceous unequally pinnatifid, Segm. obtuse, Pedunc. and pedicel bracteated
2517 Hairy, Leaves unequally pinnatifid, Segments cut glaucous beneath, Berries torulose furrowed smooth 2518 Hairy, Lvs, unequally pinnat. Segm, cut glauc. beneath, Sepals as long as cor. Berries round rather hairy 2519 Hairy, Lvs. unequally pinnat. Segm. cut glauc. beneath, Pedunc. with bract. Sepals twice as long as cor. 2520 Hairy, Lvs. unequally pinnatifid, Segm. cut glaucous beneath, Pedunc. without bract. Berries obcoaical 8 2. Unarmed. Leaves pinnate, pinnatifid, or entire.
2521 Root tuberous, Stem herbac. Segm, of lvs, unequal, the altern. ones minute, Pedicels stalked, cor, 5-ang.
e Root tuberous, Stem herbaceous, Leaves pinnate sublyrate pilose, Pedic. jointed, Cor. 5-cleft
2522 Leaves pimnate waved, upper simple lanc, Racemes in panicled cymes sometimes longer than petioles
2523 Leaves cordate ovate oblong hairy on each side waved at edge, Racemes pendulous as long as petioles
2524 Stem half shrubby rooting ascending runners muricated, Lvs. obl. lanc. pubescent simple, Racemes 2-fid 2525 Smooth, Leaves pinnatifid segments linear lanceolate terminal elongated, Racemes lateral corymbose 2526 Stem angular wavy rough, Leaves pinnatifid, Racemes cymose
2527 Stem rounded prostrate rooting, Lvs, deeply pinnat. Sinuses obtuse, Racemes cymose as long as petioles

and Miscellaneous Particulars.
spines; and others retain their fruit in our stoves during winter, which may be a recommendation to some to admit them in collections.
S. dulcamara has roots which smell like the potatoe; being chewed, a sensation of bitterness is first felt, and then of sweetness, whence the specific name. The berries excite vomiting and purging, and the twigs and leaves have been used in rheumatic and scorbutic cases with good effect.
S. tuberosum, Pomme de Tcrre, Fr., Kartoffel, Ger., Pomo de Terra, Ital., Potades, Span., \&c. is supposed to be a native of South America, and to be found in a wild state in elevated places in the tropical regions, and in the more temperate districts of the western coasts of that country. Some tubers, said to be of the wild potatoe, have been received from these parts by the Horticultural Society, and cultivated by them; their produce differs very little, if at all, from that of the common cultivated sort; they are small, roundish, and pink and white colored. (Hort. Trans. 5. 257.) It appears probable that the potatoe was first brought into Europe from the mountainous parts of South America in the neighbourhood of Quito, where they were called papas, to Spain, early in the 16 th century. From Spain, where they were called battatas, they found their way to Italy, and there received the same name as the truffle, tarafoufli. From Italy they went toVienna, through the governor of Mons in Hainault, who sent some to Clusius in 1598. To England the potatoe found its way from North America, being brought from Virginia by the colonists sent out by Sir Walter Raleigh in 1584, and who returned in July 1:86; and, "probably," says Sir Joscph Banks, "brought with them the pi)tatoe." Gerarde,

History, Use, Propagation, Culture,
in his Herbal, published in 1597, gives a figure of the potatoe, under the name of Potatoe of Virginia, whence he says he received the roots; and this appellation it appears to have retained, in order to distinguish it from the battatas or sweet potatoe (Convolvulus battatas) till the year 1640, if not longer. "The sweet potatoe," Sir Joseph Banks observes, "was used in England as a delicacy long before the introduction of our potatoes; it was imported in considerable quantities from Spain and the Canaries, and was supposed to possess the power of restoring decayed vigor. The kissing comfits of Falstaff, and other confections of similar imaginary qualities, with which our ancestors were duped, were principally made of these and of eringo roots." Gough says the potatoe was first planted by Sir Walter Raleigh on his estate of Youghall near Cork, and that thty were soon after carried into Lancashire. Gerrarde and Parkinson, however, mention them as delicacies for the confectioner, and not as common food. Even so late as Bradley's time they are spoken of as inferior to skirrets and radishes.

The use of potatoes, however, became more and more known after the middle of the 18th century, and has greatly increased in all parts of Britain within the last thirty years. It is also very general in Holland, and many parts of France and Germany, and is increasing rapidly in Russia. In Spain, and the East and West Indies they are not much cultivated, owing to the heat of the climate; but in all the temperate parts of North America, Australasia, and South America they are grown by the colonists. In China they are cultivated, but not extensively, owing to the slow progress which every thing new makes in that country. Indeed, no root hitherto discovered is so well adapted for universal use as the tubers of the potatoe; for, having no peculiarity of taste, and consisting chiefly of starch, their farina is nearly the same as that of grain. Hence, with the flower of potatoes, puddings, and such preparations as do not call the gluten of wheat-flower into action, may be made equal to those of millet or rice, and excellent bread with a moderate proportion of good wheat-flour. Potatoe starch, independently of its use in the laundry, and as a hair powder, is considered an equally delicate food as sago or arrow-root. As starch and sugar are so nearly the same, that the former is easily converted into the latter, the potatoe yields a spirit equal to that of malt by distillation, and a wine or beer by the fermentative process.

The varieties of the potatoe are very numerous, differing in earliness, lateness, form, size, color, and quality. The names for these are quite arbitrary or local. In general, every district has its peculiar or favorite varieties. Some of these degenerate, and others improve when removed from one district to another. New varieties

## 6 3. Unarmed. Leaves lobed, sinuate, angular, toothed, or entire.

2528 Leaves ovate lanceolate entire or lobed, Racemes cymose opp. to the leaves, Cor. 5-parted 2529 Leaves lanceolate sinuate tomentose bright-green, Pedunc. few-flowered, Sepals ovate acute 2530 Stem wavy, Leaves ovate cordate upper lanceolate, Corymbs opposite the leaves
2531 Stem smooth, Leaves cuneate at the base sinuate smooth, Peduncles few-flowered short 2532 Leaves ovate repand angular smooth, Peduncles 1 -flowered cernuous, Berries torulose 2533 Leaves ovate angular repand smooth unequal at base, Pedunc. 1-flowered cernuous, Berries round 2534 Leaves oblong lanceolate subrepand, Peduncles 1-flowered outside the leaves
2535 Branches rounded, and leaves smooth ovate entire, Flowers umbelled
2536 Branches smooth angular toothed, Leaves ovate smooth entire, Flowers numerous umbelled
2537 Stem and branches angular toothed, Leaves subovate sinuate angular, Flowers umbelled
2538 Leaves ovate toothed angular ciliated, Umbels extrafoliaceous stalked
2539 Stem angular, Leaves ovate toothed naked, Flowers in umbels
2540 Branches strigose pubescent angular winged, Wings toothed, Leaves ov. rep. smooth, Flowers in umbels 2541 Branches angular toothed pubescent, Leaves ovate repand upper entire, Flowers in umbels
2542 Stem rounded villous, Leaves ovate angular toothed villous hoary, Flowers in umbels

## 4. Unarmed. Leaves quite entire.

2543 Stem shrubby, Branches powdery, Leaves oblong lanceolate powdery on both sides, Racemes spreading 2544. Leaves ovate and subcordate waved curled acuminate, Flowers corymbose

2515 Leaves oval pointed at each end smooth, Racemes cymose
2546 Stem erect, Leaves ovate lanceolate attenuated at each end pubescent, Racemes 2 and 3-chotomous
2547 Leaves ov. obl acuminate entire downy, Surface discol. Axils leafless, Corymbs terminal dichotomous
2548 Leaves ovate oblong acuminate woolly axillary, Leaflets semicircular, Corymbs di-trichotomous
2549 Lvs. in pairs one obl. narrow, towards each end obt. other smaller obov. ellipt. Cymes stalk opp. the lvs. 2550 Leaves ovate lanceolate acute shining smooth, Peduncles 1-flowered, Berries oval
2551 Branches spiny, Leaves elliptical, Peduncles filiform 1-flowered
2552 Stalks axillary 1-flowered, Cal. 10-cleft, Leaves mostly in pairs subsessile elliptical
2553 Stem climbing flexuose, Lvs, ovate lanc. smooth acuminate, Pedunc. in pairs, Cal. unequally toothed
8 5. Prickly. Leaves entire or sinuate-angular.
2554 Leaves discolored the lower sinuate prickly upper entire unarmed, Pedunc. few-flowered
2555 Stem unarmed, Leaves lanceolate repand undulated acute
2556 Leaves lanceolate acuminate revolute on both sides at the base
2557 Stem prickly, Leaves lanceolate pubescent beneath entire edge revolute at base
2558 Leaves lanceolate repand obtuse reflexed at edge
2559 Stem prickly, Prickles acerose, Leaves cordate unarmed repand wavy, the young ones purple
2560 Leaves lanceolate oblong attenuate at each end roughish beneath prickly, Raceme short unarmed
2561 Stem nearly unarmed, Leaves ovate oblong sinuate repand rough, Corymb extrafoliaceous stalked
2562 Stem nearly unarmed, Leaves lanceolate ellipt. entire above smooth beneath tomentose, Cymes mealy
2563 Stem downy, Leaves lanceolate long entire hoary beneath, Racemes terminal, Sepals subulate
2564, Stem with downy prickles, Leaves lanceolate acute unarmed above smooth beneath hoary

and Miscellaneous Particulars.
are readily procured by sowing the seeds, which, with care, will produce tubers the third year, and a full crop, the fourth. As fow of the early sorts produce blossoms, to procure seeds from them deprive the plant of its tubers as they appear, and keep the runners from which they proceed above ground, by not earthing up the plant, and blossoms and seeds will soon be produced. This Mr. Knight completely proved, and the rationale is developed in the Philosophical Transactions for $1800^{\circ}$. It appears that the same sap gives existence both to the tuber and blossom, and that whenever a plant of the potatoe affords either seeds or blossoms, a diminution of the crop of tubers, or an increased expenditure of the richness of the soil, must necessarily take place. This led Mr. Knight to attempt the practice adopted by the Dutch florists with their bulbous flowers, viz, to pinch off the flowers to strengthen the bulbs. This, in the potatoe, Mr, Knight thinks may add an ounce in weight to the tubers of each plant, or considerably above a ton per acre. The practice is now general among scientific cultivators even in field culture.
The curl is a well known disease of potatoes, which frequently disappoints the cultivator of a crop, or renders that produced of little value. A great variety of opinions exist as to this disease: without enumerating these, we may state, as the general result of experiments by different persons, that the curl arises in most, or at least in many cases, from using over ripe tubers as seed stock, or from the employment of seed stock which has been injured or improperly kept during the winter; that is, kept exposed to the light and air instead of being covered with earth, or sand, or straw, so as to preserve their juices. The experiments of various farmers and gardeners, as recorded in the Farmer's Magazine and Caledonian Hort. Mem., lead to the above conclusions.

The culture of the potatoe, both in the field and garden, is universally known. It may be forced in pots or on dung or tan beds; and, for this purpose, using sets from tubers that have been retarded a year in an icehouse or cold place, is found a great advantage. Thus, in planting in December 1823, use tubers of crop 1822. These, from the long period of repose which they have had, will be found highlv exciteable by heat, and of much more rapid growth than sets of the preceding crop. As matter of curiosity, boxes containing alternate layers of light earth and potatoes of the last season but one may be placed in any dry covered place, free from frost, in November, and they will produce a brood of young tubers in contact with the old ones on the December following, without either leaves, roots, or runners. (Hort. Trans. i. 225.)
Potatoes are best preserved by burying in pits in dry ground, so deep as to be under the influence of surface temperature, or so enveloped with thatch as to produce the same effect. At a certain depth, they will keep

2567 Stem nearly unarmed, Leaves ovate subrepand tomentose unarmed, Berries ovate oblong, Seeds pulpy 2568 Stem diffuse, Prickles straight dilated at base, Lvs. obl sinuate pinnatifid, Pedunc. 2-fid, Berries globose 2569 Stem prickly, Leaves oblong tomentose sinuate angular, Segm. sinuate toothed, Sepals reflexed 2570 Leaves ovate oblong sinuate repand downy white beneath, middle nerve beneath with smooth prickles 2571 Leaves subcordate sinuate lobed beneath hoary above white at edges, Berries 3-celled globose
2572 Stem very prickly hairy, Lvs. cord. obl. lob. Lobes tooth. Fertile cal, very prickly, Berries cher.-shaped 2573 Stem very prickly, Lvs. cordate lob. Lobes acute toothed villous and prickly on both sides, Berries round 2574 Stem vil. with scat. prickl. Lvs. subcord. lob. prickly on both sides very vil. Ber. like the teat of an animal 2575 Stem prickly, Lvs, cordate sinuate acutely lob. vil. and prickly on both sides, Pedunc. and cal. unarmed 2576 Stem prickly, Lvs. cord. angular toment. with the racemes and calyxes prickly, Ber. hairy cov. by calyx 2577 Stem prickly, Leaves smoothish lobed obtuse prickly, Peduncles in pairs
2578 Stam prickly, Leaves 3-lobed obtuse smooth, Flowers racemose violet
2579 Stem prickly, Leaves ovate oblong tomentose sinuate angular acuminate, Racemes simple ax
2780 Stem prickly, Leaves oblong acute sinuate pinnatifid downy, Prickles straight scarlet
2581 Stem erect prickly, Lvs. pinnat. sinuated prickly on both sides, Segm. sinuated obtuse, Racemes prickly 2589 Stem decumbent diffuse prickly, Leaves sinuate pinnatifid prickly on both sides smooth, Calyxes prickly
8. Prickly. Leaves pinnatifid or bipinnatifid, Berries covered by the enlarged and prickly calyx. 2583 Stem villous prickly, Lvs. pinnatifid, Segm. acute sinuate toothed, Racemes cymose lateral and terminal 2584 Stem shrubby rounded prickly, Leaves bipinnatifid prickly on both sides villous

2585 Leaves cordate entire, Racemes divided, Cal. unarmed
2586 Leaves elliptical sinuate tomentose, Flowers several large terminal
2587 Stem and leaves prickly, Leaves ovate pinnatifid hairy on both sides
2588 Stem woody prickly hairy, Leaves deeply pinnatifid, Anthers small
2589 Fruit oblong pendulous and erect their stalks smooth, Stem herbaceous
2590 Fruit globose pendulous, Stalks smooth, Stem shrubby
2591 Fruit globose ovate erect in pairs, Stalks smooth, Stem shrubby
2592 Fruit ovate pendulous in pairs, Stalks pubescent, Stem shrubby
2593 Fruit oblong ovate subcompressed erect, Stalks smooth, Stem herbaceous
2594 Fruit oblong obtuse, Stalks smooth, Stem erect
2595 Fruit oblong mucronate, Stalks smooth, Stem shrubby
2596 Fruit globose, Stalks smooth, Stem shrubby
2597 Fruit oblong, Stalks pubescent, Stem shrubby
2598 Fruit oblong acuminate incurved, Stalks smooth, Stem herbaceous
2590 Fruit heart-shaped, Stem herbaceous
2600 Fruit very large angular obtuse, Stem herbaceous
2601 Fruit heart-shaper angular, Stem herbaceous
2602 Fruit ovate conical erect, Stem half shrubby
2603 Leaves linear lanceolate, Fruit pyramidal erect yellow, Stem shrubby
2604 Fruit ovate erect, Footstalks and leaves pubescent, Teeth of the calyx 5 subulate spreading
2605 Young stalks ciliated, Berries erect globose
2606 Leaves ovate acuminate, Stalks ciliated, Cal. obtuse

ripe, dried in the sun, pounded and mixed with salt: it is then kept stopt in bottles, and is commonly known by the name of Cayenne-pepper. A mixture of sliced cucumbers, shallots or onions cut very small, a little lime juice and Madeira wine, with a few pods of bird pepper, well mashed and mixed with the liquor, seldom fails to provoke the most languid appetite in the West Indies. It is there called Man-dram. Gathered fresh from the plant, the pods of all the species are liberally used both in the East and West Indies, to assist digestion and correct flatulencies.
C. frutescens and minimum, the latter by many considered only a variety of the former, low shrubs with an oval red berry more sharp and biting than any of the others, furnish the Cayenne pepper of the shops, The ripe pods are dried in the sun, and then in an oven after bread is baked, in an earthen or stone pot, with flour between the strata of pods. When quite dry they ase cleaned from the flour, and beaten or ground to fine powder. To every ounce of this, a pound of wheat flour is added, and it is made into small cakes with leaven; these are baked, cut into small pieces, baked again that they may be as dry and hard as biscuit, and then are beaten into powder and sifted. It is then fit for use as a pepper, or for being packed up, in a compressed state, and so as to exclude air, for exportation.
C. annuum, Piment, Fr., Spanischer Pfeffer, Ger., Peberone, Ital,, is cultivated for its fruit, which is used in a green state for pickling, and ripe for mixing with other ingredients, as Tomatos, \&c. to form sauces. They are also dried and ground, and used like Cayenne pepper. The seed is sown in the end of March or beginning of April on a moderate hot-bed, and covered a quarter of an inch. When the plants are two or three inches in growth, some are transplanted into a new slight hot-bed to forward them for final planting; or in default of such a hot-bed, they are placed in a bed of light rich earth, from twelve to eighteen inches apart, where they are finally to remain in the end of May, and protected during night by mats. They will flower in July, and

Campanulacere．Sp．75－240．

1803．C s．p Aub．gui，t． 122
Sp． 2.
Jamaica 1775，C s．p Bot．mag． 286 Jamaica 1812，C s．p

History，Use，Propagation，Culture，
produce plenty of pods from August till the end of September．They may be also raised under hand－glasses， and in very warm situations treated as common annuals．C．cerasiforme is sometimes cultivated for the same purposes as the common capsicum．
454．Leec．Named after the first James Lee，of the Hammersmith Nursery，an excellent cultivator and most worthy man．The plants have little more beauty than a hemlock．Cuttings root easily under a hand－ glass in heat．
 cover the placenta．A pretty stove plant with sweet white flowers．
456．Dentella．A diminution of dens，a tooth；the divisions of the corolla having each three little teeth．
457．Macrocnemum．From $\mu \propto x \rho o s$, long，and ynцк，a stamen．
458．Exostemma．From $\epsilon \xi$, out，and $\sigma \pi \boldsymbol{\sigma} \mu \mu \varepsilon$ ，a crown，in allusion to the protrusion of the stamens；one of the characters on account of which the genus has been separated from Cinchona．

The genus Cinchona，which was so named after the Countess of Cinchon，who being cured by the use of this plant，first brought it into notice，is very nearly related to this，and is a most important genus，as fur－ nishing the Peruvian or Jesuit＇s bark．The bark is taken from various species；but that which produces the best is said to be C．officinalis，a native of Peru，and not yet introduced to this country．The Jesuit＇s bark tree of Jamaica is the Exostemma caribæum，but land there is too valuable for its culture． Our species are not very common in collections，being of slow growth，and not very easily propagated．Sweet

# 2607 Stem furrowed angular smooth, Leaves nearly bipinnate <br> 2608 Stem rounded pubescent, Leaves pinnated <br> 2609 Stem angular fringed, Leaves pinnated <br> 2610 Stem angular, Stalks smooth, Leaves broad ovate serrated 

## 2611 Leaves opposite ellipt. Flowers terminal in umbels

2612 Stem creeping much branched smooth, Leaves stalked opposite oval flat entire
2613 Corymbs axillary long naked
2614 Leaves elliptical acute opposite, Flowers whorled sessile
2615 Peduncles axillary and terminal 1-flowered, Leaves ovate lanceolate
2516 Flowers terminal panicled smooth, Caps, terminal smooth, Leaves elliptical acuminate smooth
2617 The only species. A fine plant with tubular red flowers like a honeysuckle
2618 Leaves sessile, Panicle dichotomous
2619 Leaves stalked elliptical acute smooth
2630 Leaves oblong acuminate hairy rigid nerved beneath, Stalks axillary erect
2621 The only species. An hexandrous plant

2622 Flowers pentandrous, Leaves lanceolate elliptical
2623 Flowers pentandrous, Leaves ovate coriaceous
81. Leaves smooth.

2624 Stems 1-flowered, Leaves ovate smooth subciliated
2625 Lower leaves obovate wedge-shaped crenate, Upper linear entire, Stem simple 1-flowered
2626 Stem 1 -flowered naked, Leaves stalked elliptical lanceolate deeply toothed
2627 Little stems 1-flowered, Radical and cauline leaves ovate subcrenate, Cal. cernuous
2628 Stems about 3-fl. Lvs. entire, the rad. ov. on cong stalks, the cauline obl. ov. sessile obtuse, Fls. nodding 2629 Lvs. all cordate serrate stalked smooth, Branches filiform 1-flow. Cal, reflex. glutinous, Cor. spreading 2630 Smooth, Radical leaves oblong and kidney-shaped serrate: cauline linear entire
2631 Smooth, Leaves all serrate: radical cordate ovate firm shining; cauline linear alternate remote
2632 Radical leaves ovate crenate with flattened stalks, Flowers racemose 1 -sided cernuous
2633 Stem hairy decumb. angular, Lvs. stalk. ser. smooth, rad. cordate, lower cauline ovate, Cor. short large
2634 Stem fliform angular striated, Branches about 1-flowered, Leaves lanceolate or linear, Flowers 5-cleft
2635 Pubescent, Lvs. rather hairy : rad. obov. rounded serrated; cauline clustered lin. entire, Sepals setaceous
2636 Leaves upright: radical lanceolate-oval, Panicle spreading
2637 Leaves wavy : radical lanceolate-oval, Panicle contracted
2638 Stem angular, Lvs. stiff obsoletely crenate serrate: rad. obl obovate; cauline lanc. lin. Flow. large
2639 Lvs. smooth ov. cord. cartilaginous-serrated, the caul. lanc. Stem upright elong. branch. Lower ped. 3-f. 2640 Lvs. obl. lanc. point. at each end serr. with veins hairy beneath, Stem erect, Rac. term. Seg. of cor. obliq. 2641 Lvs, cord, and lanc. serr. lower stalks ciliated, Fls, axill, sessile, Cor. 5 -parted flat, Style longer than cor

and Miscellaneous Particulars.
advises cuttings to be " taken off when ripe, planted in a pot of sand, plunged in mosst heat, and covered with a bell-glass."
459. Burchellia, Named by Mr. Robert Brown, after William Burchell, a traveller in the southern part of Africa, from whom we have two volumes of travels, and the promise of other works hereafter. The species is a beautiful dwarf shrub with scarlet flowers in terminal clusters.
460. Rondeletia. Plumier established this genus in memory of William Rondelet, a scientific physician, whose attention was chiefly occupied by fishes and alge. He was born in 1507, and died in 1566. Rabelais ridicules him under the name of Rondibilis. He is said to have given a disgusting proof of his fondness for anatomy by dissecting his own son.
461. Coutarea. So named by Aublet from its vernacular name in Guiana, Coutari. A most beautiful plant, requiring the utmost heat of the stove; but very rare in gardens, if it indeed exists in cultivation at all now.
462. Portlandia. In honor of the Duchess of Portland, once a famous patroness of botany. Splendid plants of the natural order Rubiaceæ. Portlandia grandifiora is common and easily grown. P. coccinea is perhaps not in the country, although stated to have been introduced in 1775.
463. Campanula. A diminution of campara, a bell; on account of the form of the corolla, which resembles a little bell. Rapunculus is a diminution of rapa, a radish, in allusion to the nature of its root. C. speculum is so called because the corolla in its form resembles a little round and elegant mirror (speculum), whence in

History, Use, Propagation, Cuiture,
English it is called Venus' looking-glass. Ancient mirrors were always round, on which account the astrological sign of Venus was $Q$, or a figure of the antique mirror and its handle. This is a shewy genus; some of the species are beautiful, and all of them of easy culture in the borders of the flower garden or shrubbery. One or two species are used in dieteties, and probably the roots of the whole might be eaten. Almost all the species have long thick white roots, which abound in an acrid milky juice.
C. rapunculus is much cultivated in France and Italy, and sometimes in Britain, for the roots, which are boiled tender and eaten hot with sauce, or cold with vinegar and pepper. It is sown in Spring on deep light soil in drills, and will be ready for use by the autumn of the same year. C. persicifolia and Rapunculoides may also be cultivated for the same purpose.
C. pyramidalis was a very fashionable plant thirty years ago, and is still cultivated, but has given way to Lobelia splendens and fulgens. It is still in demand in Holland as an ornament to halls, staircases, and for being placed before fire-places in the summer season; for which purpose it is planted in large pots, and trained in the fan manner, so as to cover a large surface. In the shade it will continue in flower for two or three

2642 Leaves oblong crenulate rigid sessile, Flowers erect flat
2643 Caps. 5-celled, Leaves elliptical serrate smooth, Flowers panicled 5 -parted, Stems shrubby fleshy
2614 Leaves cordate serrate smooth, Thyrse terminal, Sepals subulate, Corolla rotate spreading
2645 Leaves lanceolate: cauline acutely serrated, Flowers panicled nodding
2646 Leaves stalked subcordate acutely serrated, Flowers small nodding, Style exserted
2647 Leaves ternate oblong finely serrated, Stem 1-flowered, Flower spreading
2648 Leaves rhomboidal serrated, Spike one-sided, Cal. toothed
2649 Leaves about 6 lanceolate toothed, Flowers whorled
[very long
2650 Stem erect, Lvs. altern. opp. and ternate lin. lanc. entire, Pan. pyram. Flowers cernu. glob. trunc. Style 2551 Stem branched upright twiggy, Lvs, lin. lanc. toothed, Pedunc. filiform long, Cor. funnel-shaped 3-4-cleft 2652 Smooth, Stem.1-H. Lower lvs. obl. cauline lin. subsetaceous, Cor. cernuous with the bott. of seg. cut out
© 2. Leaves rough.
2653 Stem rounded striated smooth, Lvs, ovate lanc. doubly serrated, Pedunc, axillary 1-f. erect, Cal. smooth 2654 Stem furrowed pubescent, Leaves ovate-lanceolate doubly serrate, Pedunc, axillary solitary, Cal. woolly 2655 Stem angular hispid, Lvs. ov. lanc. coarsely serrated, Pedunc. axillary 1-flowered cernuous, Cal. hispid
2656 Stem angular, Leaves stalked, Cal. ciliated, Peduncles trifid
2657 Leaves cordate-lanceolate, Stem branched, Flowers one-sided scattered nodding, Cal. reflexed
2658 Leaves oblong unequally toothed rough beneath, Stem panicled, Bractes and calyx ciliated
2659 Leaves downy : lower cord. lanc. stalked, Flower nodding, Germens woolly
2660 Leaves ovate lanceolate beneath scabrous sessile, Stem panicled
[very long
2661 Stem rounded and lvs, beneath tomentose, Lower lvs, cordate lanc. stalked, upper sessile, Raceme term.
2662 Stem angular simple smooth, Leaves scabrous oblong lanceolate cordate sessile, Head clustered
2663 Stem angular subsimple hispid, Rad. lvs. ovate cordate stalked: cauline cordate sessile, Flowers clustered 2664 Hispid, Flowers sessile, Head terminal, Leaves lanceolate linear wavy
2665 Stem simp. few-f. Lvs. hairy, lower cord. lanc. stalked, upper obl. sessile, Flowers nodding, Cal. hispid
2666 Leaves ovate-oblong sessile serrated, Stem simple angular, Flowers panicled
2667 Leaves lanc. twin serr. and branched stem hispid, Flowers panicled, Calyxes hispid, Seg. dilated serrated 2668 Stem angular smooth, Caul leaves sessile equally toothed wavy lanceolate, Floral cordate, Cor. tubular 2669 Hispid, Raceme ovate oblong terminal, Stem quite simple, Leaves linear lanceolate
2670 Leaves ovate rugose, Leafstalks with a dilated and serrated edge, Stem simple hispid, Flowers spreading 2671 Leaves oblong waved hairy, Flowers terminal cernuous, Cal. smooth
2672 Leaves lanceolate toothed hispid, Pedunc. very long 1-Howered with strigose capsules

> 83. Capsules covered by the reflexcd recesses of the calyx. Medium.

2673 Stem simple erect pubescent, Lvs. lanc, crenate, Racemes simple with nodd. flowers, Cor. bearded inside 2674 Hairy, Radical leaves stalked ovate acute serrate, Flowers cernuous dotted inside villous
2675 Stem undivided erect hispid. Leaves lanceolate obtusely serrated sessile 3-nerved at base, Flowers erect
2676 Hispid, Caps. 5-celled, Branches pyramidal, Peduncles axillary, Flowers erect solitary
2677 Hispid, Spike lax, Flowers alternate, Leaves linear entire
2678 Stem simple, Pedunc. axillary 1-flowered 2-leaved
2679 Caps. 5-celled covered stalked, Stem prostrate, Leaves very soft nearly round
2680 Caps. 5-keeled covered, Flowers alternate nodding, Leaves obovate crenate
2681 Radical leaves reniform coarsely doubly serrate : cauline ovate toothed sessile
2682 Leaves reniform cordate doubly crenate stalked tomentose beneath, Flowers one-sided reflexed
2683 Stem panicled pubescent, Leaves lanceolate obtuse wavy
2684 Stem simple diverging pubes. Lvs. lanc. obtusely serrated sessile veiny, Pedunc. axill. 3-fl. and terminal
2685 Hispid, Stem simple, Flowers capitate terminal, Leaves lanceolate obtuse crenate
2686 Lvs, obovate wavy rough, Stem creeping, Branches erect few-flow. Segm. of the hispid cal. nearly equal
2687 Caps. stalked, Leaves serrated: radical lyrate; cauline lanceolate nearly wedge shaped
2688 Radical leaves stalked cord. doubly serr. Raceme few-flowered lax
2689 Caps. covered, Leaves oblong wavy hispid; radical sinuated, Flowers clustered sessile terminal
2690 Leaves woolly : radical lyrate; cauline rounded ovate serrate, Flowers cernuous
84. Corolla in some degree unequal, Stigma nearly simple, Capsule opening at the end. 2691 Stem dichotomous, Leaves sessile, the upper opp. 3-toothed 2692 Leaves cordate 5 -lobed stalked smooth, Stem lax

and Miscellaneous Particulars.
months. The art of producing a very large plant is to begin with pots of a small size, and shift frequently during two years, till at last the plant occupies a pot of a foot or more in diameter. Rich light soil should be used, but no animal manures or recent dung, as these are found very injurious. Cuttings of the roots flower the second, and seedlings the third year. C. carpatica and grandiflora may be treated in a similar manner.
C. lilifolia has a singular anomaly in the leaves, which before the panicle is produced come out in a kind of rose on the summit of the stem, but are, through its prolongation, afterwards dispersed. The flowers vary much both in size and color, and the roots are eaten in China both raw and boiled.
C. glomerata is a handsome rock or pot plant; it requires a dry lean soil, otherwise, as in most plants, the flowers lose the intensity of their color in that which is very rich.
C. hederacea is a very small plant, with the leaves so much resembling those of Veronica hederifolia, that Linnæus suspected it to be a hybrid.
C. medium is a very ornamental border flower of the easiest culture, and with varieties, double and single,

## § 5. Capsules prismatical. Prismatocarpus.

2693 Caps. columnar 5-celled, Stem shrubby, Leaves linear subulate, Peduncles very long, Panicles terminal 2694 Caps. linear 2-celled, Leaves lanceolate coarsely serrated smooth, Stem decumbent 2695 Stem very much branched diffuse, Leaves oblong crenate, Flowers solitary

2696 Stem branched at base upright, Leaves oblong crenate, Cal, aggregated longer than corolla
2697 Branching diffuse, Lower leaves oblong obtuse, Upper lanceolate, Flower solitary, Cor. longer than calyx 2648 Stem simple, Leaves cordate toothed stem-clasping, Flowers sessile clustered

2699 Leaves linear villous, Stem erect
2700 Leaves linear smooth, Stem erect
2701 Shrubby, Leaves linear erect close together
2702 Leaves linear one toothed on each side
2703 Leaves linear 2-celled, Scape simple naked racemose
2704 Leaves lanceolate, Raceme spiked
2705 Stem erect, Leaves lin, lanc. obtuse alternate entire, Raceme terminal
2706 Stem half shrubby erect, Leaves lanc. ovate serrate toothed, Rac. term. Pedic, as long as flowers
9707 Leaves ovate toothed hairy, Stem simple
2708 Leaves lanceolate pinnatifid toothed, Raceme terminal
2709 Leaves lanceolate toothed, Peduncles very short lateral, Tube of cor. filiform very long
2710 Smooth, Lower leaves oblong toothed, upper lanceolate entire, Peduncles racemose 1 -sided
2711 Erect simple slightly pubescent, Lvs. obl, obt. almost entire, the lower spatulate, Spike naked small flow
2712 Leaves broad lanceolate serrate below toothed decurrent, Racemes compound terminal
2713 Leaves narrow lanceolate toothed revolute at edge and stem pubescent, Raceme terminal
2714 A tall plant with rugose coarse leaves, and a long spike of fine red fiowers
2715 Leaves oblong lanceolate cartilaginous-toothed and erect stem smooth, Raceme terminal 1-sided leafy
2716 Leaves narrow lanceolate toothletted flat at edge and stem quite smooth, Raceme terminal
2717 Leaves lanceolate serrated smooth, Peduncles lateral longer than the leaf
2718 Flowers axillary, Stem winged, Radical leaves ovate lanceolate with glandular reflexed teeth
$2719 \mathrm{~L} v s$, ovate-obl. acute at each end unequally serrated, Flowers axillary solitary, Recesses of calyx reflexed 2720 Liss, obl. acuminate serrated smooth, Pedunc. axill. 1-fi. Sepals linear lanc. spreading, Anthers bearded

2721 Leaves ovate cut, Stem divided, Racemes terminal naked, Upper lip of cor. bearded
2722 Smooth, Stem ascending 4-cornered, Leaves ovate-lanceolate cut serrate twice as short as leafstalk
2723 Stem hairy, Lvs. toothed serrate, the lower ov. obl. the upper ovate, Pedunc. axillary 1-fl. Caps. inflated
2724 Stem erect, Leaves cordate obsoletely toothed stalked, Corymb terminal
2725 Smooth erect, Stem 3-cornered, Leaves ovate round repand, Pedunc. longer than leaves
2726 Stem erect, Lower leaves obovate toothletted, upper lanceolate serrate, Raceme terminal 1-sided
2727 Quite smooth, Lvs. broad lanc. serr. Spike many-flowered 1-sided, Sepals entire, Lower petals ov. acute 2728 Radical leaves ovate, Scapes capillary
2729 Stem prostrate, Leaves lanceolate oval-crenate, Stem branched, Peduncles solitary 1-flowered very long 2730 Radical leaves spatulate repand, Cauline setaceous, Stems simple 1-flowered erect
2731 Leaves somewhat stalked lanceolate oblong toothed, Stems decumbent, Peduncles elongated
2732 Stem spreading, Lvs, toothed, lower ellipt, stalked, upper sess. narrow lanc. Pedunc. longer than leaves 2733 Stems prostrate filiform, Leaves stalked oblong toothed
2734 Stems spreading, Lower leaves oblong toothed pubescent subsessile, Upper lip of cor, reflexed
2735 Leaves ovate lanceolate deeply toothed, Peduncles axillary 2 or 3 times as long as leaves
2736 Stems angular prostrate and leaves lanceolate toothed hairy, Peduncles axillary 1-flowered
2737 Stems procumbent, Leaves lanceolate serrated, Flowers sessile spiked
2738 Shrubby hairy prostrate. Leaves ovate toothed, Flowers lateral with very long stalks 2 or 3-flowered

and Miscellaneous Particulars.
fulgens is given by J. B. Van Mons, and W. Hedges, in the Hort. Trans. Both confess that very little art is required. Hedges, to procure strong flower stalks, keeps the plants in pots, shifts very frequently from a smaller to a larger size, places them first in cucumber frames, and when they begin to flower in a stove. The pots in which they are allowed to flower are nine inches in diameter, and, in order to supply abundant moisture, pans are placed under the pots constantly filled with water. The soil used is equal parts of loam and leaf-mould, with a third of the whole of sand, They begin to flower in July, and continue flowering through the autumn. One plant so treated produced a flower-stalk which measured six inches in circumference at the base; the height of the centre spike of fowers was five feet and a half; the shoots from the bottom and sides of the main stem were in number seventeen, and rising four and a half feet.
L. splendens and cardinalis may either be treated as above, or as a tender border, or as frame plants. Van Mons observes, that L. cardinalis perishes in sandy soil, but becomes strong and multiplies in loam, while, at the same time, it produces the most brilliant colors in the former. The same thing may doubtless be predicted of the other species; it being a well known law of nature as to living beings, that their energies are concentrated in proportion to the obstacles thrown in the way of their expansion.
L. siphilitica has its specific name from its supposed efficacy in the cure of siphilis, among the North American Indians. Sir William Johnston purchased the secret from them, but Woodville says, its virtues have not been confirmed by any instances of European practice.

2759 Leaves sessile, Lower obovate crenate-serrate, Upper lanceolate entire, Flowers racemose
2760 Leaves pinnate, Flowers very large in cymes
2761 Rad, leaves lin. spatulate entire, Flowers $\frac{1}{\mathbf{1}}$-whorled in 3-flowered alternate parcels
2762 Branches erect, Leaves ovate serrated flat
2763 Much branched diffuse, Branches divaricating recurved, Leaves subulate

2764 Leaves linear ciliated upright, Flowers sessile
2765 Diffuse, Leaves ovate recurved toothed, Flowers terminal aggregate
2766 Leaves lanceolate ciliated entire decurrent, Flowers solitary terminal
2767 Leaves ovate toothed reflexed smooth, Flowers terminal solitary
2768 Erect smooth, Leaves ovate acute toothed serrated, Axillæ bearded, Sepals subulate filiform 2769 Erect pubescent, Branches angular, Lower leaves Iyrate, Upper obovate acute

2770 A small herbaceous plant with large entire radical leaves

2771 Leaves lanceolate entire or toothed fleshy smooth, Cor, hairy outside
2772 Stems diffuse branching, Racemes axillary and terminal
2773 Stem rounded branched leafy, Radical leaves spatulate : cauline lanceolate
2774 Smooth, Bractes of the dichotomies distinct, Leaves lyrate or toothed-cut at base
2775 Leaves ohovate smooth entire
2776 Spikes terminal and axillary, Leaves fleshy obovate toothed
2777 Leaves alternate obovate toothed smooth, Fruit very small
2778 Leaves entire obovate thick rough, Drupe berried (Goodenia calendulacea.)

and Miscellaneous Particulars.
470. Dampiera. Named by Mr. Robert Brown, in honor of Captain William Dampier, a famous voyager, whose knowledge and attention, in matters connected with botany, are attested by the remains of the collections made during his voyages, and now preserved in the Sherardian Herbarium at Oxford.
471. Samolus. Derived from two Celtic words, san, salutary, and mos, pig; a plant which is salutary to pigs. Pliny says, it was considered among the Gauls as a specific in all maladies of swine. The plant was collected with mystic ceremonies. S. Valerandi was named after Dourez Valerand, a botanist of the l6th century, men472. Velleia . Small marsh plants with white flowers.

472, Velleia. Named by Sir James Smith, after Major Velley, a gentleman who paid much attention to marine algæ. The genus resembles Goodenia in appearance.
473. Screvola. So named from sceva, the Latin word to express the left hand, the flower having the
appearance of being defective of one half of its corolls appearance of being defective of one half of its corolla. An extensive New Holland genus resembling Goodenia.

History，Use，Propagation，Culture，
474．Caprifolium．A poetical name，signifying goat－leaf；that is to say，a leaf which climbs like a goat． Cheurefeuille，Fr．，Geisblatt or Baumlilie，Ger，，and Caprefoglio，Ital．This is a beautiful genus of flowering odoriferous mostly twining shrubs，valuable in the flower garden，shrubbery，and against walls，arbors，or trunks of trees．Like most British twiners，the honeysuckle follows the sun．Like other twiners，it bears pruning well，for，as Professor Martyn observes，＂those plants which in a state of nature cannot ascend without the assistance of others，are often liable to lose large branches；they have therefore a proportionate vigor of growth to restore accidental damages．＂Against a wall，the climbing kinds are very liable to attacks from aphides，and the caterpillar of Phalcena tortrix；and the sphinges，or hawkmoths，according to Withering， extract the honey from the very bottom of the tubular flowers with their long tongues．

In raising the honeysuckle from seeds，they should be sown the autumn after they are ripe，otherwise they will not come up the first year．Cuttings are sometimes apt to rot，owing to water lodging in their tubular stems above the last joint．To obviate this inconvenience，some make the cuttings of double the usual length，and insert both ends in the ground，leaving the part above ground in the form of a semicircle．Com． monly，however，such cuttings root only at one end；or if at both，but very weakly at what was the top end．

475．Loniceva，Named after Adam Lonicer，a German，who was born in 1528，and died in 1586．＇There was another Lonicer，John，who wrote commentaries upon Dioscorides．A section of what was formerly called Lonicera，comprising the species with a shrubby upright stem，neither climbing nor prostrate plants．All hardy and easily increased by layers or cuttings．

476．Symphoria，is a symcope of symphoricarpos，from ovp，together，$\varnothing \in \rho \omega$ ，to bear，and zagжos，fruit；a plant which bears its fruit together in clusters．A small genus of low branching shrubs，formerly constituting part of Lonicera．

477．Diervilla．Dierville，a French surgeon，travelled in Acadia，whence he sent this plant to his friend Tournefort，who named it after him．A pretty low shrub，with yellow flowers appearing in the spring．
478．Triosteum．From $\tau \xi_{6}$, three，and ošav，bone，three bones，on account of its three hard seeds．The roots of this genus and of Diervilla are used indiscriminately in N．America for Ipecacuana．（Viola．Ipec．）
479．Coffea．An alteration of the Arabic name qahoueh，which is the name for the liquor of coffee；the grain is called boun．Cahwa，Pers．．Cahvey，Turk．，and Eleave，Egypt．

2779 Flowers whorled terminal, Leaves deciduous, the upper perfoliate
2780 Heads term. generally 3 together, Lvs. decid. pubes, opp. upper perfo. smooth, lower with stalks only conn. 2781 Whorls in heads with bracteæ, Lvs. deciduous glaucous beneath, Upper perfoliate, Cor. gibbous at base 2782 Spikes nearly naked terminal, Lvs. oblong evergreen, the upper perfoliate, Tube of cor, ventricose above

2802 Leaves oval acuminate, Leães abruptly narrowed at base, Axillæ 1-many-flowered
2803 Stem hispid, Leaves oval-lanceolate somewhat connate, Axillæ l-flowered
2804 Leaves oblong ovate acuminate, Peduncles axillary aggregate, Cor. 5-cleft
2805 Leaves oblong lanceolate acuminate, Panicle few-flowered trifid terminal, Cor, 4-cleft

and Miscellaneous Particulars.
C. arabica is an erect, conical-shaped, low tree, with a light brown bark, and opposite, oblong, wavy, shining, light green leaves; flowers in clusters at the base of the leaves, white, of a grateful odor, but of short duration; berries green, red when fully grown, and black when ripe. A decoction of this berry forms the well known beverage which is said to have been drank in Ethiopia from time immemorial. It was introduced into Arabia from Persia about the middle of the 15 th century, and proceeded by Mecca, Medina, and Grand Cairo, Damascus, and Aleppo to Constantinople, where two coffee-houses were opened in 1554. It is thought to nave been introduced to Venice soon after 1615: it was known at Marseilles in 1644, and Thevenot, a French traveller, brought it to Paris in 1657. Till 1660, it was drank by such only as had been accustomed to it in the Levant. About the end of the 17th century a coffee-house was opened at Paris, by one Pascal, an Armenian, who, not succeeding, came to London, where coffee had been previously introduced by Daniel Edwards, a Turkey merchant, who brought home with him a Greek servant, Pasqua Roffee, who understood the roasting and making of coffee, and afterwards set up a coffee-shed, which he was enabled in time to turn to a house in the churchyard of St. Michael's, Cornhill, In 1688 Ray affirms that London might rival Grand Cairo in the number of its coffee-houses.
The coffee-tree was first introduced to Europe through the Dutch, who procured some berries at Mocha to be sown at Batavia; which being done in the year 1690, Governor Witsen presented a plant to the botanic garden of Amsterdam, where it bore fruit and produced many young plants. From these the East Indies and most of the gardens of Europe have been furnished. Coffee was afterwards cultivated by the Dutch in Surinam in 1718, and by the French in Cayenne and the Mauritius soon afterwards. It was next grown in Martinique, and so spread to the neighbouring islands and to Jamaica in 1730, or earlier. The plants are raised from seeds, then transplanted into nursery lines. Plantations are made chiefly on hills and the skirts of mountains, and, if possible, where the soil is moist and shaded. The trees are planted from five to ten feet apart, according to the goodness of the soil and situation. They produce fruit the next year after planting; and the produce of a good tree is from $1 \frac{1}{2}$ to 2 lbs . of berries. The berries are gathered when they begin to fall, and in this state their pulpy bark begins to shrivel. They are further dried under sheds, and there passed between wooden rollers to separate the husk from the kernel; and afterwards sifted, winnowed, and put into casks for sale. In Arabia the plant and berries are much smaller than in the West Indies, and the flavor in

## History, Use, Propagation, Culture,

consequence greater; bulk being, in these richer soils and more humid climates, obtained at the expence of flavor. In our stoves the coffee-tree is raised from the berry, which must be sown soon after being gathered; otherwise if kept six weeks it loses its vital powers. Cuttings of ripened wood root in sand under a glass in moist heat: transplanted, and furnished with plenty of water and pot room, they flower and fruit abundantly.
480. Chiococca. Snowberry, ( $\chi^{10 v}$, snow, and жoxzos, berry). Its berries are of a bright whiteness.
481. Serissa. A name of Commerson's, the meaning of which is not known. The genus is remarkable for the trifid segments of corolla.
482. Canthium. From canti, the Malabar name of the plant. Spiny rigid plants with small opposite leaves. and solitary, sessile, usually fragrant, white flowers.
483. Psychotria. From $\psi_{\chi \chi} \eta$, life; in allusion to the powerful medicinal effects of one of the species, $\mathbf{P}$. emetica; or, as others say, from $\psi \sim \chi$ or po甲ov, an ancient name for an herb loving shade. The genus consists of a great number of stove plants, nearly all bearing white flowers. Some of them are very beautiful on account of their foliage : one species, $P$. parasitica, is parasitical upon trees in the West Indies,
484. Hamellia. In honor of the celebrated Henry Louis Du Hamel Du Monceau, born in 1700, died in 1782, author of numerous works on vegetable physiology. The genus consists of handsome shrubs of the West Indies, with tubular yellow or orange-colored flowers.
485. Posoqueria. The Galibis in French Guiana call this plant aymara-posoqueri. A fine shrub, with white flowers more than a foot long, and an eatable yellow berry as big as a hen's egg.

2806 Leaves ovate acuminate, Racemes subdivided axillary 1-sided nodding
2807 Leaves opposite ovate lanceolate, Stipules spiny, Flowers axillary sessile

2808 Spiny, Flowers sestile hairy
2809 Spiny, Leaves c; ate wedge-shaped obtuse, Sepals leafy, Berries crowned
2810 Stipules emarginate, Leaves lanceolate ovate
2811 Stipules ovate persistent, Leaves elliptical acuminate subcoriaceous, Berries ribbed
2812 Stipules stem-clasping retuse, Leaves ovate acuminate succulent veinless, Cymes stalked as long as Ieaves 2813 Stipules ovate oblong bifid, Raceme terminal compound, Flowers clustered sessile
2814 Stem herbaceous creeping, Leaves cordate stalked
2815 Stipules 2-toothed, Leaves lanceolate ovate acuminate pubescent, Panicles cymose spreading
2816 Stipules connate entire deciduous, Leaves oblong ribbed wavy acuminate
2817 Leaves ellipt. narrowed each way, Panicles term. erect lax brachiate shorter than the leaves
2818 Racemes terminal colored, Leaves 3 together villous pubescent
2819 Branches rounded, Leaves ternate oblong hairy on both sides, Flowers corymbose
2820 Racemes terminal and axillary, Cor. campanulate ventricose, Leaves ternate
2821 Racemes terminal, Leaves oblong wedge-shaped acuminate smooth, Flowers stalked
2822 Stipules and leaves oblong-acuminate, Corymbs terminal about 6-flowered, Tube of cor. much curved
2823 Stem unarmed, Leaves large ovate stalked
2824 Stem spiny, Leaves small nearly sessile
2825 Leaves lanceolate, Cor. hypocrateriform, Cal. angular, Stem rooting
2826 Leaves elliptical, Cor. hypocrateriform, Sepals subulate lanceolate vertical
2827 Leaves elliptical, Cor. hypocrateriform, Calyx bursting at side, Sepals dilated at end
2828 Leaves obovate roundish, Cor. hypocrateriform, Sepals subulate bluntly kecled
2829 Leaves oblong, Stipules subulate. Sepals subulate rounded, Tube smooth dilated short
2830 Branches scarred with two spines at the end, Leaves oblong ovate obtuse, mouth of cor. villous
2831 Terminal spines of the branches 4, Sepals linear wedge-shaped, Flowers clustered
2832 Leaves elliptical acute at each end longer than the spines, Flowers sessile smooth
2833 Spines axillary straight shorter than the oval smooth leaf, Flowers terminal solitary
2834 Unarmed, Lvs. ovate pubescent beneath, Fls. usually hexandrous, Cor. hairy on each side, Tube short 2835 A fine species, of which no detailed character has yet been given
2836 Very like G. florida, from which it chiefly differs in being smaller with narrower leaves
2837 Leaves oblong lanceolate, Peduncles axillary many-flowered, Tube short
2838 All over hairs, Leaves oblong-obovate, Flowers clustered on the summit, Fruit rounded flat

2839 The only species, with very long white flowers

and Miscellaneous Particulars.
486. Vanguicra. An abbreviation of the Madagascar name of one species, Voa-vanguier. A fine looking bush, with broad, green, entire leaves. It is said to bear a fine fruit as big as an orange.
487. Ga+denia. So named by Ellis, in honor of his friend and correspondent A. Garden, M. D. of Charleston, in Carolina, who sent home many new species of plants. This is a beautiful genus, and most of the species are highly odoriferous, and free flowerers. G. forida, on the first approach, smells like the flower of the orange, but on being more closely sroelled to, like Narcissus. According to Thunberg, there are hedges of it in Japan, and the Japanese are very fond of it near their houses, and in the walks of their gardens. The fruit and seeds are used there to dye yellow. G. Rothmannia smells most during night: it bears an ovate, fleshy, angular berry, black when ripe, and about the size of a small pear. Almost all the species are spiny in their wild state; but lose their spines at an advanced age, or under high culture and keeping. In the stove they require a moist heat to make them flower freely, as do the cuttings to make them strike. According to Sweet, the best way to flower the greenhouse species is to set them in a close frame on a little bottom heat, but not to plunge the pots.
488. Genipa. A name contrived by Plumier from the name, Genepapo, it bears in Guiana and Brazil. G. americana is an exceedingly rare plant in collections. It bears an excellent fruit, in much request in Dutch Guiana, where it is called Marmalade-box.
489. Oxyanthus. From o豸้s, acute, and ay卂os, a flower, on account of the acute segments of the corolla A genus divided froin Gardenia, from which it is readily distinguished by the long tube of the flower.

History，Use，Propagation，Culture，
490．Randia．So named in honor of Isaac Rand，F．R．S．，who published the first catalogue of the Apothe－ caries＇Garden at Chelsea．

491．Musscenda．A name by which Burmann designates a plant of this genus．V．A．Zeyl．t．76．The species are all of singular beauty，and especially distinguished by the large colored segment of the calyx，which is either white or purple，and very remarkable．

492．Pinckneya．So named by Michaux，after some American gentleman of the name of Pinckney，who is now forgotten．The genus is nearly the same as Mussænda．It thrives best，according to Sweet，when turned out against a south wall，and protected by a mat in frosty weather．

493．Erithalis．A name given by Pliny to a plant remarkable for the verdure of its foliage ；Egt，a particle signifying augmentation，and $V_{\alpha} \lambda \lambda \omega$ ，to be green．It is now applied to a pretty genus of South American plants．
494．Webera．In honor of G．Henry Weber，a German botanist，who published Flora Gottingensis，in 1778，and other works of merit．He is chiefly known for the attention he bestowed upon muscology．Small plants with bunches of white flowers．
495．Plocama．From $\pi$ дожє $\mu$ s interwined hair，on account of its pendulous twisted branches．A little bush with the habit of some kind of Galium．The flowers are very small，and not much longer than the calyx．
496．Morinda．Morus indica，Indian mulberry ；so named by Vaillant，from the shape and color of its fruit． The bark of the roots of this genus is used in the $\mathbf{E}$ ．Indies to dye yellow．
497．Cephaelis．From zEфळ入n，a head，on account of the flowers being united in heads，remarkable for the large，often colored，involucrum in which they are enveloped．Species are very rare in collections；and require a high temperature．
498．Sarcocephalus．From owgzos flesh，and zєゅ๙ $\lambda$, ，a head，in allusion to the large fleshy fruit of the genus．This is like a pine－apple without its crown，of a dull uniform color，and consisting of a solid fleshy mass containing many minute seeds．The flavor is said to be excellent．A plant now common in gardens near London，but it has not yet fruited．
499．Hirtella．Derived from nirtus，hairy．Its branches are covered with fine hair．Some of these are tall trees of the tropics，usually supporting themselves upon other plants．Flowers，which are generally blue or purple，are rarely seen in this country．Cuttings rout in sand under a hand－glass，

and Miscellaneous Particulars.
 flowers, and ternary disposition of its leaves. It is the Limonia trifoliata of gardens, a common bush, sometimes covered over with the little orange berries, which have an agreeable orange-like taste.
501. Vitis. From the Celtic gwyd, a tree or shrub. The $G$ being suppressed in the pronunciation, according to the usage of Celtic nations, the Latins have made of it vitis; the Spaniards vid; the French vigne; and the English vine. The term muscat, applied to particular kinds of grape, is not derived from the perfumed or musky flavor of those varieties, but from the berries attracting flies, musca, for which reason the Latins called the kind vitis apiaria.
V. vinifera is universally known for its fruit, and for producing the first liquor in the world ; a liquor which, notwithstanding all that is said of its dangerous qualities, is yet eagerly drank by all who can procure it, and preferred before all others by those who are unlimited in their means and choice. The grape vine is among fruits what wheat is among the cereal grasses, or the potatoe among the farinaceous roots; and, like them, in every country where it will grow, it is cultivated with pre-eminent care. In Britain, its culture is now confined to the garden as a dessert fruit; though formerly grown in many places for the wine-press. Besides the V. vinifera, the V. labrusca (from busca, the Hebrew for grape) and laciniosa are all cultivated, and both are now so intermingled with the Grst species by hybrid products, that for all practical purposes they may be considered as only varieties.

The varieties of the grape in countries where it is grown for the wine-press, are almost as numerous as the vineyards; for as these for the most part differ in soil, aspect, elevation, or otherwise, and as the vine is greatly the child of local circumstances, its habits soon become adapted to those in which it is placed. When it is considered that a vineyard once planted will last two or three centuries, it will readily be conceived that the nature of a variety may be totally changed during only a part of that time. The varieties most in esteem for wine making, are small berries, and bunches with an austere taste. The Burgundy, as modified by different soils and situations, may be considered the most general vineyard grape of France, from Champagne or Marne to Marseilles and Bourdeaux. The best wine in Italy and Spain is also made from grapes of this description; but in both countries many of the larger berried sorts are grown as being more productive of liquor. The sweet vines, as the Malmsey, Madeira, Constantia, Tokay, \&c. are made from sweet-berried grapes allowed to remain on the plants till over ripe. That wine is the strongest, and has most flavor, in which both the skins and stones are bruised and fermented. The same thing is the case in making cider; but in both processes bruising the stones or kernels is often neglected.

History, Use, Propagation, Culture,
The varieties of dessert grapes on the continent are few : the best they have, as the Muscats and Frontignacs, have been obtained from this country. The Chasselas or frame grape (our Muscadine), is almost the only eating grape known in the Paris fruit market. In Britain, we have not only the best varieties, but we grow the fruit to a larger size and of a higher flavor than is done any where else in the world. This is owing to the perfection of our artificial climates, and the great attention paid to soil and subsoil, and other points of culture.
The vine is universally propagated by cuttings, either a foot or more long, with a portion of two year old wood, or short with only one bud, or one bud and half a joint, \&c. Varieties without end are raised from seed; and it is thought that by propagating from the seeds of successive generations some sorts may ultimately be procured better adapted for ripening their fruit in the open air than now known. A seedling vine carefully treated will show blossoms in its fourth or fifth year; say that it produces a fair specimen of its fruit in the sixth year, then a new generation may be obtained every sixth year.
The vine will thrive in any dry soil, or in any soil with a dry subsoil ; but it produces the best flavored fruit among granitic and calcareous fragments, and loamy soil in thin strata, with little manure, and when the vine is old and the berry and bunch small: on the contrary, the most luxuriant crops, large bunches and berries, in a good depth of friable loam, dry below and richly manured with the strongest of animal manures.
There are three methods of pruning the vine in hot-houses; the fruit tree method, in which the plant is spread out in the fan manner, and treated like a common fruit tree; the long or young wood method, in which all the wood above a year old is cut out down to the stool or stock; and the spurring-in method, in which the fruit is produced from young wood grown annually from the sides of a main shoot or shoots of old wood. The two last methods are the best..

Vitis vulpina, the foxgrape, (so called from the foxy flavor of its berries) is cultivated much in North America, of which country it is a native. Many improved varieties have been raised by the American gardeners, and have been sent to Europe under the name of the Bland, the Isabella, the Oswego Tokay, \&c. \&c.; but they are all tainted with the bad taste peculiar to the species, and can be in no estimation when even an early July grape is to be procured.
502. Ampelopsis. From $\alpha \mu \pi \in \lambda 05$, a vine, and $0 \% 15$, resemblance. The genus resembles the vine in habit, leaves, and flowers; is commonly employed for covering old walls, for which the rapidity of its growth renders it very suitable.
503. Rhamnus. From the Celtic ram, signifying branching. From this word the Greeks have gained ¢apros, the Latins ramus, and the French rame, or in old French reim; for which reason the arms of the

2861 Leaves cordate acuminate nearly equally toothed smooth on both sides, Racemes loosely many-fruited
2862 Leaves unequally cut toothed shortly trifid, Stalk nerves and edge pubescent
2803 Leaves shining on both sides reniform cordate equally toothed, Flowers in many little heads
2864 Leaves quinate, Leaflets many-cleft
2865 Shoots very cæsious, Leaves cordate angular
2866 Leaves cordate acute toothed 3-lobed, Nerves villous beneath, Racemes twin bifid
2867 Leaves bipinnate smooth, Leaflets cut-lobed, Racemes stalked twin bifd
2868 Leaves palmate $3-5$-leaved smooth on both sides, Leaflets stalked oblong acuminate
2869 Leaves palmate 3-5-leaved on each side pubescent, Leaflets ovate acuminate coarsely toothed
2870 Flowers monogynous hermaphrodite erect, Caps. 3-coccous, Stalks rusty tomentose
2871 Flowers hermaphrodite trigynous axillary in umbels, Leaves elliptical acute entire villous beneath
2872 Spines terminal, Leaves linear-lanceolate serrate acute
2873 Unarmed, Leaves lanc. acute at each end serrated with hairs at the axillæ, Flowers axillary clustered
2874 Spines terminal, Flowers 4-cleft diocious, Leaves ovate, Stem erect, Berry 4-seeded
2875 Spines terminal, Flowers 4-cleft dioecious, Stems procumbent
2876 Spines terminal, Leaves linear entire obtuse
2877 Spines terminal, Leaves oblong entire
2878 Branches spiny, Flowers 4-cleft or trifid diœcious, Leaves oblong obtuse evergreen
2879 Spines terminal, Flowers 4 -cleft hermaphrodite
2880 Spines terminal, Leaves ovate serrulate, Branches divaricating
2881 Leaves ovate entire smooth sessile, Branches square
2882 Unarmed, Leaves lanceolate serrulate acute at each end pubescent beneath
2883 Flowers diœecious, Leaves ovate-lanceolate glandular crenulate
2884 Creeping, Flowers hermaphrodite, Leaves stalked ovate crenate
2885 Flowers monogynous hermaphrodite, Leaves entire smooth, Berry 2-seeded
2886 Flowers monogynous hermaphrodite, Cal. villous, Leaves elliptical entire acuminate rounded at base
2887 Flowers hermaphrodite racemose, Leaves ovate bluntly serrated smooth at the base glandular
2888 Flowers polygamous, Style triple, Leaves ovate serrated
2889 Flowers hermaphrodite, Stigma triple, Leaves cordate, Branches with tendrils
2890 Flowers hermaphrodite, Leaves oval acuminate serrated veiny beneath
2891 Flowers hermaphrodite, Leaves oblong acuminate scarcely perennial
2892 Flowers diocious, Stigma triple, Leaves evergreen elliptical serrated acute at the base obtuse
2893 Flowers diœcious, Stigma triple, Leaves evergreen lanceolate acute at each end mucronate toothed
2894 Leaves ovate ribbed veiny repand, Flower-stalks one flowered, Stem erect
2895 Diœecious unarmed, Stem twining, Leaves ovate mucronate repand subcrenate striated

and Miscellaneous Particulars.
town of Rheims are two branches intertwined. R. catharticus was formerly used in medicine, and is still employed in color-making, and sometimes in dying. The juice of the unripe berries has the color of saffron, and is used for staining maps or paper. They are sold under the name of French berries, as those of R. Clusii are, under the name of Avignon berries. The juice of the French berries when ripe, and mixed with alum, is the sap green of the painters; but if the berries be gathered late in the autumn, the juice is purple. The bark affords a beautiful yellow dye. The inner bark, like that of elder, is said to be a strong cathartic, and to excite vomiting. The berries operate briskly by stool, but occasion thirst and griping. It is said by Woodville that the flesh of birds which feed on them is purgative.
R. lycioides furnishes the wood of which the Monguls make their images, on account of its hardness and orange red color.
R, saxatilis greatly resembles $R$. catharticus. The berries are used to dye the Maroquin or Morocco leather yellow.
R. theezans has leaves like the common tea, which are used as such by the poor of China, and called Tia, (Osbeck.)
R. frangula has dark purple berries, which are purgative, like those of the common buckthorn. Gathered before they are ripe they dye wool green and yellow; when ripe, blue-gray, blue, and green. The bark dyes yellow, and with preparations of iron, black. From a quarter to half an ounce of the inner bark boiled in small beer, is a sharp purge. In dropsies or constipations of the bowels in cattle, it is a very certain purgative. The flowers are particularly grateful to bees. Goats devour the leaves voraciously; and sheep will eat them. Charcoal prepared from the wood is used by the makers of gunpowder. The berries of this species, and also of the cornus, are said to be brought to market and sold for those of the buckthorn; but they are easily distinguished, the true buckthorn having four seeds, this two, and the cornus one.
$\mathbf{R}$. hybridus is the offspring of $\mathbf{R}$. alpinus and alaternus, first procured by L'Heritier about 1778.
$\mathbf{R}$. alaternus is an ornamental evergreen, with mellifuous blossoms, much frequented by bees. It is sometimes confounded with the Phillyrea; but they may be easily distinguished by the position of their leaves, which are alternate in these, but placed opposite by pairs in that. It is a rapid growing shrub, and useful for thickening screens, clothing walls, \&c.

504, Enoplia. From oıvorivg, vinous. Its little fruit, full of juice, rescmbles the berry of a grape. The Rhamnus volubilis and lineatus belong to this genus, and are beautiful little climbing plants, but rather impatient of cold.

History, Use, Propagation, Culture,
505. Paliurus. Madıros is the Greek name of a place. The city of Paliurus was situated on the coast of Africa over against Candia. Paliurus australis is a handsome free flowering, but very prickly shrub: it has broad roundish buckler-shaped seed-vessels, which have borders like the brims of a hat, the footstalks being fastened to the middle. From this singular appearance of the fruit, like a head with a broad-brimmed hat on, the French call it porte chapeau. This shrub is by many persons supposed to be that from which the crown of thorns which was put upon the head of Jesus Christ was composed; the truth of which is supported by many travellers of credit, who affirm that this is one of the most common shrubs in the country of Judea; and from the pliableness of its branches, which may easily be wrought into any figure, it may afford a probability. Hasselquist, however, is of opinion, that it was a species of Rhamnus, called therefore by Linnzus R. Spina Christi.
506. Zizyphus. A name altered by the Greeks from asafifa, its name in the East. Vide Shaw's Voyage, 47. Suppl. It is called Zizounf in Arabic, Golius. Z. Lotus, is the true Lotus of the Lotophagi. It is a prickly branching shrub, with alternate, small, blunt, three-nerved leaves, solitary fowers, and the fruit a spherical drupe, the size of a wild plum, sweet and harmless ; inclosing a small, round, bony, two-celled nucleus; first green, but when ripe tinged with saffron-color. It is found on the eastern as well as the western extremity of the African desert; and Major Rennel thinks he has seen it on the Ganges. Dr. Shaw found the fruit common in Barbary ; it was sold in the markets, cattle fed with it, and a liquor drawn from it. Mr. Park found it very common in all the kingdoms which he visited : he describes the fruit as small farinaceous berries, of a yellow color and delicious taste. The natives, he says, convert them into a sort of bread, by exposing them some days to the sun, and afterwards pounding them gently in a wooden mortar, until the farinaceous part is separated from the stone. This meal is then mixed with a little water, and formed into cakes, which, when dried in the sun, resemble in color and flavor the sweetest gingerbread. A gruel is next made from the meal which still adheres to the stones. The Greeks supposed the people who ate the lotus to be confined to an extent of sea-coast on the north of Africa, including the gulphs of Syrtes. The plant grows readily in our greenhouses, and might be fruited if thought desirable. It is propagated by ripened cuttings planted in sand under a hand-glass.

2926 Leaves lanceolate 3-comered spreading, Ray of calyx shorter than the head
2927 Leaves linear lanceolate 3-cornered spreading, Ray of calyx longer than the head

and Miscellaneous Particulars.
Z. jujuba is a middle-sized tree, with ovate leaves, pale yellowish flowers, and red oval fruit, about the size of olives, inclosing a stone of the same shape. They are sweet, and eaten in the East Indies and China.
Z. vulgaris is a middle-sized branching tree, bearing a saffron-colored drupe shaped like an olive, but smaller. The plant grows wild in Calabria, and is cultivated in other parts of Italy, and in Spain. The fruit is eaten green or dried as a sweatmeat. It is common in China, Japan, Syria, \&c. and is said to have been first introduced into Italy from the latter country in the time of Augustus, All the species are readily increased by ripened cuttings planted under a hand-glass.
507. Celastrus. From xniou, the latter season. The ancients considered the holly, the Genista, and the Celastros, the trees which ripened their fruit latest. The Celastros of the ancients is thought to have been a kind of Euonymus, to which this genus is nearly allied. It consists of shrubs or small trees, with alternate leaves, and numerous small fowers. The plants are of easy culture, but of no great beauty.
508. Senacia. A genus divided by M, de Lamarck from Celastrus, and founded upon the Celastrus undulatus of L'Heritier
509. Euonymus. From $\epsilon \nu$, well, and oyopa, a name, well named. The application of the name is, however, obscure to us. Euonymus was also a Heathen divinity; according to Epimenides she was the mother of the Furies by Saturn. Fusain, or Bonnet de Prêtre, Fr., Spindelbaum, Ger., and Fusaggine, Ital. The species form neat little trees of no great beauty or use. E. europæa is called prick-wood, from the use of the wood formerly as skewers. E americana best merits culture, and next, E. latifolia. They are easily increased by seed or ripened cuttings.
510. Ceanothus. Keoywios is a name used by Theophrastus to designate a prickly plant, from zew, to rrick. This is a genus of North American plants, one species of which, C. americana, is very common in gardens, The leaves are dried in Carolina and used as tea, and the root to dye wool a Nankeen cinnamon color. The species are of the easiest culture, but of very little beauty.
511. Staavia. Named after Martin Staaf, a correspondent of Linnæus. Little Cape shrubs, with heads of flowers resembling those of some compound plant. Young cuttings in sand, and covered with a bell, soon strike root.

 2956 latifólia $W$.

History, Use, Propagation, Culture,
512. Pomaderris. From $\pi \tilde{\omega} \mu \alpha$, a lid, and $\delta \varepsilon \rho \bar{p}\llcorner$, a skin, on account of the membranous lid with which the cells of the capsule are covered. New Holland shrubs, with the habit of Ceanothus, from which they are distinguishable only by their fruit. Cuttings root freely in sand under a hand-glass.
513. Mangifera. From Manga or Manghos, the vernacular name of the fruit, and fero, to bear. This is a large spreading tree, bearing a fruit in great estimation in the East. The wood is brittle, brown, and used only for indifferent works. The leaves are seven or eight inches long, and two or more broad, lanceolate, entire, of a shining green, and sweet resinous smell. The flowers are produced in loose bunches at the ends of the branches. The fruit is a berried drupe, large, flattened like a lens, kidney-shaped; the flesh soft and pulpy, like a damascene plum ; the shell almost kidney-shaped, of a leathery crustaceous substance, and onecelled. This fruit, when fully ripe, is yellow and reddish, replete with a fine agrecable juice; some are full of fibres, and the juice runs out of these on cutting, or with a little handling; but those which have few or no fibres are much the finest ; they cut like an apple, but are more juicy, and some are as big as a large man's fist. It is esteemed a very wholesome fruit, and, except very fine pine-apples, is preferable to any fruit in India; gentlemen there eat little other fruit in the hot months; but if no wine be drank with it, the Mango is apt to throw out troublesome boils, at least with new comers, which are, however, conducive to health. In Europe we have onty the unripe fruit brought over in pickle.

Loureiro remarks, that there are many varieties, differing chiefly in the figure, size, color, and taste of the fruit, as apples and pears do in Europe. Retzius, on the contrary, affirms, that there are certainly several distinct species; the number of stamens in some being double; the racemes in others compound; the fruit kidneyshaped, globular, fleshy, almost juiceless, \&c.

According to Sweet, " the Mango ripens fruit in this country, when the plants are of a good size. Sandy loam, or a mixture of loam and peat, is most suitable to it, and the pots should be well drained, as the plants are apt to get sodden with too much water. Fresh seeds from the West Indies vegetate freely. The plant may also be increased from cuttings, which root best in sand under a hand-glass." (Bot. Cult. 77.)
Knight, Hallet, and some other horticulturists are at present cultivating this tree with a view to its fruit. Knight recommends for such trees, training the shoots downwards, and at no great distance from the glass, There are trees in the garden of Earl Powis which must bear very soon
514. Schrebera. Named after John Chr. Daniel Schreber, a German botanist, chiefly known by an edition of

2928 Leaves ovate-oblong doubly-serrated tomentose beneath, Flowers apetalous in racemes 2929 Leaves oval tomentose beneath, Heads of flowers in umbels panicled
2930 Cymes panicled terminal, Leaves ovate lanceolate entire coriaceous rusty beneath
2931 Leaves linear, Flowers in axillary clusters as long as leaves
2932 Leaves lanceolate wavy, Panicles terminal many-flowered, Stamen 1
2933 The only species

2934 Peduncles solitary 1-flowered, Leaves somewhat hairy
2935 Leaves lanceolate linear, Peduncles solitary 1-flowered smooth, Fruit smooth
2936 Leaves smooth, Cor, cylindrical, Peduncles solitary 1-ft. Petals very long rolled inwards at edge
2937 Panicles few-flowered, Leaves somewhat hairy, Anthers connivent
2938 Branches spiny, Leaves ovate obtuse
2939 Leaves lanceolate acute with red veins
2940 Leaves elliptical coriaceous toothletted, Petals and stamens four
4941 Leaves 3-cornered obtuse ciliated, Flowers terminal
2942 Leaves linear obtuse smooth spreading, Flowers terminal solitary
2943 Leaves linear carinate mucronate villous, Peduncles 1-flowered terminal corymbose 2944 Leaves 3-cornered acute dotted ciliated
2945 Leaves 3-cornered obtuse smooth, Flowers terminal solitary
2946 Leaves oblong lanceolate carinate appressed rough at edge, Flower terminal nearly solitary
2947 Leaves linear carinate mucronate ciliated upright, Peduncles 1-2 flowered corymbose terminal
2948 Leaves linear carinate acute thickish fringed upright, Flowers terminal subsessile solitary or 4 together 2949 Leaves 3-cornered villous-hispid imbricated, Flowers in spiked heads

2950 Leaves lanceolate smooth, Flowers terminal solitary, Calyxes fringed
2951 Leaves oblong smooth ciliated, Flowers terminal in umbels, Calyxes smooth
2952 Leaves ovate oblong glandular scattered, Peduncle glutinous aggregate terminal twice as long as leaves
2953 Leaves linear carinate mucronate at the edge cartilaginous and rough, Flowers axillary and solitary
2954 Leaves cordate, Lower ovate, Upper lanceolate, Umbels terminal
2955 Leaves linear lanceolate serrulate
2956 Leaves ovate crenate pubescent, Peduncles lateral 1-flowered, Branches downy

and Miscellaneous Particulars.
Linnæus's Genera Plantarum, which he published in 1789, in which he unadvisedly altered all the names of Aublet, without ever having seen the plants.
515. Billardiera. Named in honor of Jacques Julien Labillardiére, a French botanist, who visited Syria, and afterwards New Holland, in D'Entrecasteaux's expedition. His reputation as a botanist was almost annihilated by the Prodromus Nova Hollandiæ of Brown. The species of this genus are desirable as climbers for a conservatory, especially B. longiflora, which is a fast grower and an abundant flowerer; and when in fruit, its fine blue berries make a bandsome appearance. They thrive well in an equal portion of loam and peat ; and cuttings root readily in sand under a bell-glass : they may also be raised from seeds, which are produced in abundance. (Bot. Cult. 149. )
516. Elcoodendrum. From $\in \lambda \propto \iota \alpha$, an olive, and $\delta \in \nu \delta \rho o v$, a tree; a tree resembling an olive. E argam furnishes an oil by expression from the fruit as in the common olive: it is used at table by the Moors, and in various works by Europeans. The tree is rather tender, and requires protection during winter.
E. australe, and the stove species, "grow freely in a mixture of loam and peat; and ripened cuttings will soon root in sand under a hand-glass." (Sweet.)
517. Diosma. From dos, divine, and ooum, smell ; that is to say, a smell divine among the Hottentots, who rub their greasy bodies with the powdered leaves of all the species, which they call Bucku. To Europeans the smell is unpleasant. This is a genus of handsome shrubs, bearing a general resemblance to heaths, but with larger leaves. The flowers are in corymbs at the ends of the branches. D. ericoides, and other species, are the kinds chiefly used by the Hottentots to scent the ointments with which they anoint their skin. Young cuttings root freely in sand under a bell-glass.
518. Adenandra. From dं $\dot{\eta \nu}$, a gland, and ayne ayסeos, a male; or, in composition of botanical names, a stamen; on account of the appendage of the stamens. This is a very natural genus, easily recognized by its glandular anthers. Sweet "t found it succeed best in sandy peat, but some prefer mixing a little sandy loam with it. The young tender tops strike best, made intocuttings, and planted in a pot of sand under a bell-glass : it does not require to be plunged in heat." (Bot. Cult. 127.)
519. Baryosma. From $\beta \times g_{v}$, strong, and órum, smell, in allusion to its fetid leaves. Plants with the habit of Diosma. Cuttings root readily, taken off in ripened wood, and planted in sand under a bell-glass.
520. AGATHOSMA. W. en. Agathosma.

History, L'se, Propagation, Culture,
520. Agathosma. From avoequs, good, and ooun, smell; to be understood as Diosma. This genus resembles that, and requires the same culture. The Hottentots use the leaves of A. puichella dried and powdered, under the name of Bucku, to mix with the grease with which they anoint themselves. It gives them so rank an odor, that Thunberg says, he sometimes could not bear the smell of the men who drove his waggon.
521. Nauclea. A noble genus of Rubiaceous plants, bearing their flowers in round heads. The meaning of the name is nowhere explained, One species, N. Gambir, is said to yield the gamboge gum of the shops.
522. Pittosporum. From $\pi t \tau \pi$, resin, and $\sigma \pi o g o s$, a seed. The capsule is resinous. These are handsome shrubs, with good foliage and pretty flowers. P, tobira, a native of Japan, is nearly hardy. Ripened cuttings root freely in sand under a hand-glass, or one species may be grafted on another.
523. Lasiopetalum. From $\lambda \alpha \sigma \omega \sigma$, woolly, and tє $\alpha, \lambda \circ y$, a petal; in allusion to the flowers. Ripened cuttings planted in sand under a hand-glass will root freely.
524. Thomasia. Named by M. Gay, after M. Thomas, an industrious collector of Swiss plants. Divided lately from Lasiopetalum.
525. Seringia. Also named by M. Gay, in honor of M. Seringe, an ingenious Swiss botanist, author of Melanges de Botanique, and other useful works. Divided from Lasiopetalum, with which it agrees in habit and appearance.
526. Büttneria. David Sigismond Augustus Buttner, was a professor of botany at Gottingen, who published,

2957 Leaves S-cornered blunt villous hispid spreading, Umbels terminal
2958 Leaves lanceolate carinated ciliated, Umbels terminal
2959 Lvs. aggregate linear lanceolate channelled glandular villous imbricated, Heads of branches terminal 2960 Leaves aggregate ovate acuminate imbricated dotted fringed, Heads of branches terminal umbelled
2961 Leaves alternate aggregate subcordate acuminate pubesc. dotted, Flowers in terminal umbelled branches
2962 Leaves imbricate spreading lanceolate ciliated, Heads terminal, Five stamens sterile *
2963 Leaves aggregate oval obtuse glandular ciliated spreading, Heads of branches terminal
2964 Leaves ovate crenate dotted beneath, Flowers axillary solitary
2965 Leaves opposite smooth ovate entire revolute at edge beneath rusty with dots
2966 Leaves ovate glandular-crenate smooth, Flowers axillary in pairs
2967 Leaves 3-cornered mucronate smooth below dotted in two rows, Segments of calyx smooth
2968 Leaves ovate carinate ciliated imbricated 4 ways, Flowers terminal solitary
2969 Leaves oblong acute, Peduncles equal, Stamens the length of corolla
2970 Leaves ohovate obtuse smooth coriaceous, Capsules 2-valved
2971 Leaves obovate blunt shining netted beneath, Panicle globose terminal
2972 Leaves obovate obtuse smooth coriaceous, Capsules 3-valved
2973 Leaves oval lanceolate narrowed at each end and stalks smooth, Peduncles of the branches terminal
2974 Leaves elliptical obtuse pubescent beneath revolute at the edge
2975 Leaves elliptical acuminate smooth, Leafstalks rusty with down
2976 Sepals smooth inside
2977 Sepals hoary on both sides

2978 Leaves linear elliptical enture, Stipules leafy, Petals 5, Stamens
2979 Petals 5, Stamens 10
2980 Leaves 3-lobed beneath hispid downy, Petals $O$
2981 Leaves ovate lanceolate coarsely toothed
2982 Leaves lanceolate toothed hastate at base, Rachis stem and leafstalks angular prickly
2983 Leaves elliptical entire emarginate, Prickles stipulary, Branches wavy smooth

2984 Leaves cordate smooth
2985 Leaves ovate entire smooth, Ovary stalked, Nectary 10 cleft rayed
2986 Leaves ovate obtuse entire with parallel veins, Flowers terminal panicled
2987 Stem branches and leaves prickly, Leaflets ovate lanceolate subserrated

2988 Stem spiny, Leaves emarginate, Flowers racemose
2989 Cal , and cor. naked
2990 Cal. and cor. fringed

and Miscellaneous Particulars.
in 1750, a catalogue of the plants in the garden of an amateur named Cunon. Ripened cuttings planted in sand under a hand-glass will root freely.
527. Ayenia. In honor of the Duke D'Ayen, of the house of Noailles. He was a great patron of botany, Cuttings root freely in sand in a moist heat.
528. Calodendrum. From жoнios, fine, and $\delta \in v \delta \rho o v$, a tree. Fine indeed, with its beautiful foliage and splendid flowers. This is a Cape genus, and is generally supposed to be one of the finest trees known there; its fruit bears great resemblance to a chestnut, but seldom arrives here perfect. It grows freely in an equal mixture of loam and peat ; and ripened cuttings root readily in pots of sand under a hand-glass. (Bot. Cult. 159.)
529. Toddalia. Kaka Toddali is the Malabar name of the shrub. Cuttings root readily in sand under a bell-glass.
530. Bursaria. From bursa, a pouch; the capsules resemble those of Thlaspi Bursa Pastoris so much, that Labillardiere fancied he had found a cruciferous tree when he discovered the plant in New Holland. "This is a pretty plant. It is very desirable for a greenhouse or conservatory, being an abundant flowerer, and very showy when covered all over with its elegant little white flowers; an equal mixture of sandy loam and peat is the best soil for it; and young cuttings are not difficult to root in sand under a bell-glass." (Bot. Cudt. 155.)
531. Cedrela. From cedrus, the cedar-tree. The wood of plants of this genus is one of the kinds of cedar of commerce. All that comes from New Holland in the form of packing cases, is supposed to be the wood of a spe.

garden glandular-leav glandular-leav two-flowered

History, Use, Propagation, Culture,
cies of Cedrela. This tree shoots out many side branches towards the top, which are furnished with winged leaves, composed of 16 or 18 pair of leaflets, so that they are sometimes near three feet long. The flowers are on a branching raceme, and the fruit a woody capsule about the size of a pigeon's egg. The bark, leaves, and fruit have, when fresh, a smell like assafœetida, but the timber has a pleasant smell. In the British West India islands the tree has the common name of cedar. The trunk is solarge as to be hollowed out into canoes and periaguas, for which purpose it is extremely well adapted; the wood being soft, it may be cut out with great facility, and being light, it will carry a great weight on the water. There are canoes in the West Indies which have been formed out of these trunks forty feet long and six broad; the wood is of a brown color, and has a fragrant odor, whence the title of cedar has been given to it. It is frequently cut ihto shingles for covering houses, and is found very durable; but as the worms are apt to eat this wood, it is not proper for building ships, though it is often used for that purpose, as also for sheathing of ships. It is often used for wainscoting of rooms, and to make chests, because vermin do not so frequently breed in it, as in many other sorts of wood, this having a very bitter taste, which is communicated to whatever is put into the chests, especially when the wood is fresh; for which reason it is never made into casks, because spirituous liquors will dissqlve part of the resin, and thereby acquire a very bitter taste. Cuttings of Cedrela strike root under a hand-glass in sand.
532. Hovenia. Named after David Hoven, a Dutch commissary in Japan, who gave facilities and encouragement to Thunberg while in that country. A small tree, nearly hardy. Its fruit is eaten in China and Japan, and is said to resemble a Bergamot pear in taste.
533. Brunia. So named after Cornelius Brun, a traveller into the Levant and Russia at the end of the last and beginning of the present century. This, Sweet observes, "is a pretty Cape genus; its species are pretty bushy shrubs, with heath-like leaves, and are handsomest while young. The flowers are not so showy as in many other genera, but some of them are very elegant. A sandy peat soil suits them best, with a moderate supply of water; and young cuttings planted in sand under a bell-glass will strike root freely." (Bot. Cult. 153.)
534. Brossaza. Gui de la Brosse was physician to Louis XIII, and in 1626 procured the establishment at Paris of the Jardin des Plantes, of which he was the first director. A very doubtful plant. It is said to be a shrub like a Cistus, with scarlet fiowers half an inch long.
535. Itea. From irce, the Greek name of the willow. The name Salix having been given to the modern willow, that of Itea has been applied to a plant resembling the willow in leaves and place of growth. This is a handsome plant which thrives well either in peat-soil or sandy loam, and is increased by layers.

2993 Leaves 3-cornered incurved acute, Flowers terminal on the lateral branches
2994 Leaves 3-cornered brown at end, Chaff of the heads exserted colored
2995 Leaves half round erect-spreading withered at end at the base and branches hairy, Heads round lateral
2996 Leaves 3-cornered obtuse smooth, Heads terminal, Branches whorled clustered
2997 Leaves 3-cornered black at the end smooth, Heads terminal
2998 Leaves ovate 3-cornered fleshy smooth, Heads terminal, Branches divaricating
2999 Leaves 3-cornered and spiked, Flowers smooth
3000 Leaves 3-cornered acute smooth, Heads lateral globose smooth
3001 Leaves linear-lanceolate reflexed spreading: their edge fringed at base, Heads terminal corymbose
3002 Leaves half rounded spreading incurved hairy at the end with a withered beard
3003 Leaves 3-cornered appressed ciliated at edge
3004 Leaves ovate acuminate ciliated. A very doubtful species
3005 Leaves short acute 3-cornered at the end spreading fuscous and callous, Heads round at end of branches 3006 Leaves ovate convex imbricated, Heads terminal hairy

3007 A little shrub like a Cistus, with ovate stalked alternate pale-green leaves
3008 Leaves ovate acute serrated, Spikes pubescent
3009 Leaves wedge-lanceolate acute membranous nerved, Spikes slender
3010 Leav̇es very long linear, Petals entire
3011 Leaves short oval abruptly narrowed into the stalk
3012 Leaves lanceolate, Raceme solitary elongated, Root tuberous
3013 Leaves nerved : radical and cauline ovate, Raceme 1-sided, Petals bifid 3014 Radical leaves spatulate ovate: cauline ovate distinct, Root fibrous 3015 Radical leaves spatulate rhomb-shaped: cauline perfoliate

3016 Flower-stalks clustered, Leaves lanceolate: the upper alternate, Spur shorter than flower
3017 Leaves alternate oblong oval serrated, Leafstalks with many glands, Spur incurved as long as flower 3018 Flower-stalks generally 2-flowered, Leaves ovate serrated, Flowers orange-brown spotted inside 3019 Flower-stalks clustered, Leaves ovate, Points of stem tumid

## and Miscellaneous Particulars.

536. Cyrilla, In honor of Dominico Cyrilli, professor of medicine at Naples, and a fellow of the Royal Society of London. He published, in 1788, a work upon the rare plants of Naples, which is now one of the scarcest of botanical works. This is a pretty shrub. Young cuttings will root under a bell-glass in sand, but not very freely.
537. Claytonia. In memory of Mr. John Clayton, who collected plants chiefly in Virginia, and sent them to Gronovius, who published them in his Flora Virginica. C. perfoliata is very hardy, and is not easily eradicated where once introduced. It grows on the poorest soil, vegetates early, and the whole of the herbage gathered and boiled makes a very tender spinage.
538. Impatiens. A metaphorical name given to these plants on account of the elastic force with which their capsules burst, and scatter their seeds upon the slightest touch. I. Balsamina is one of the most beautiful of popular annuals, forming a shewy cone of finely variegated carnation-like flowers. The prevailing colors of the petals are red and white, the former extending to every shade of orange, purple, scarlet, lilac, pink, and especially carnation or flesh color. Those are esteemed the most beautiful varieties which have the flowers double, and striped in the manner of a flake or bizarre carnation: but none of the varieties are permanent or can be continued by seeds, and the plant does not root readily by cuttings. The way to procure very large plants is to sow early in the season, as in March, to commence transplanting into 3-inch pots as soon as the plants have two proper leaves, and to shift every week or ten days into pots a size larger every time, till at last they are in pots of the largest or of a very large size, and in the richest light mould. The plants should be kept all the time in a hot-bed or pit, plunged, and with abundance of room and air, and the heat of the melon or pine. Fairweather, by transplanting only three or four times from No. 48, pots to those of eight inches diameter raised, produced balsams "four feet high, and fifteen feet in circumference, with strong thick stems, furnished with side branches from bottom to top, and these covered with large double flowers." (Hort. Trans, iii. 406.)

The juice of the balsam, prepared with alum, is used by the Japanese to dye their nails red. (Thunberg.)

1. Nolitangere, Ne me touchez pas, Fr., Springsame, Ger., and Erba Impatienta, Ital., is the only species found wild in Europe. When the seeds are ripe, upon touching the capsules, they are thrown out with considerable force : hence the names Impatiens and Nolitangere. In the day-time the leaves are expanded, but at night they hang pendent, contrary to what is observed in plants, which from a deficiency of moisture, or a too great perspiration from heat, commonly droop theirleaves during the day. Only the goat is said to eat this plant.
I. biflora, the American Noli-me-tangere, resembles this plant, but is handsomer.

## History，Use，Propagation，Culture，

539．Sauvagesia．In honor of Jacques Boissier de Sauvages，a French botanist，who died in 1767．He pub－ lished a Flora of Montpelier，and other works．A genus of small herbaceous plants，more singular than beautiful．
510．Viola．The ancients feigned that violets were the first food of the cow Io，one of Jupiter＇s mistresses． This is an extensive genus of low herbs，mostly with violet and white flowers，and well adapted for the flower－ border，rock－work，or for growing in pots．V．odorata is a favorite flower，on account of its fragrance and early appearance．It is a native of every part of Europe，in woods，amongst bushes，in hedges，and on warm bank．

## 3020 Stem simple, Leaves narrow lanceolate, Stipules very long

1. Slemless, Stipules membranous.

3021 Pubescent, Leaves palmated 5-lobed toothed and undivided
3022 Leaves pedate 7-parted
3023 Leaves many-cleft, Segments lobed
3024 Leaves obl. acute cord. sagittate serr. cut at base, Flowers inverted, Three lower petals bearded at base
3025 Smooth, Leaves shining lanceolate obsoletely toothed or crenulate, Flowers whitish [middle
3026 Smth. Lvs, cord, ac. cren, serr. flattish, Fls. erect, Pet. obliquely turned : lateral longer bearded below the
3027 Smooth, Leaves cordate serrate smooth hooded at base, Petals obliquely turned; lateral bearded
3028 Leaves cordate crenated pubesc. beneath, Lower petal bearded at base, Flower-stalks shorter than leaves
3029 Lvs. triang. cord. ac. cren. somewhat hood. Pet, obov. : 3 low, beard, below mid, conniv. : 2 upper reflexed
3030 Leaves oblong cordate obtuse crenate naked at the base with unequal inflexed hooded lobes
3031 Stemless, Leaves cordate smooth, Peduncles bracted above the middle
3032 Smoothish, Lvs. roundish obt. at base cord. cren. serrate, Runners fowering, Pet. lin, not longer than cal.
3033 Leaves cordate obtuse acutish flat smooth, Petals not bearded, Flower-stalks as long as leaver
3034 Leaves oblong subcordate, Stalks membranous
3035 Leaves cordate and stalks hispid with hairs, Cal. obtuse
3036 Subhirsute, Runners none, Leaves cordate, Calyxes obtuse, Flowers sweet-scented
3037 Leaves cordate vertilinear at base pubescent, Runners none
3038 Leaves reniform smooth, Root creeping, Calyx obtuse
3039 Leaves cordate acuminate subcrenate smooth, Bractes close under the flower, Lower petal truncate
3040 Creeping runners and stalks smoothish, Cal. obtuse

3041 Nearly stemless, Leaves roundish elliptical crenate stalked, Stipules lin. serrated, Spur as long as calyx

## 8 2. Caulescent, Stipules membranous.

3042 Old stem ascending, Leaves oblong cordate obt, dotted, Stipules setaceous toothed, Cal. lanceolate acute 3043 Stem square erect, Radical leaves cordate reniform, Flower-stalks longer than the leaves
3044 Stem erect angular, Lvs, cord, toothed crenat. smooth, Stip. tooth, on one side, Bract. above midd. of stalk 3045 Stem spread. compressed, Lower lvs. cord, ovate : upper ovate-lanceol. crenul. Stip. toothed on each side 3046 Stem ascending rounded, Leaves ovate lanceolate, Stipules cut serrated
3047 Stem erect, Leaves cordate oblong, Stipules toothed on one side, Anthers free
3048 Pubescent, Stem simple erect, Leaves ovate obl. acute, Petals lanc. entire, Flower-stalks length of leaves 3049 Caulescent weak, Stipules membranous lanceolate slightly torn, Leaves shortly cordate toothed
3050 Stems erect and procumbent, Leaves oblong entire sinuated ciliated hispid, Stipules undiv. Calyxes acute 3051 Stems filiform undiv. procumb. Leaves ovate stalked: their edge at the base ciliated, Stipules undivided 3052 Smoothish, Leaves subcordate acuminate serrated, Flower-stalks length of leaves, Stipules short entire 3053 Leaves cordate acuminate serrated flattish, Stipules lanceolate serrated ciliated
3054 Villous pubescent, Stem erect leafy at top, Leaves broad cordate, Stipules oblong serrated at end
3055 Erect, Leaves broad lanceolate, Stipules linear lanc. entire, Flower-stalks axillary in pairs very short
3056 Stem erect and leaf-stks. 3-corner. Rad. A. with cor, but sterile; caul, apet. fertile, Lvs. reniform cord, cren.
3057 Stem weak about 2 -flowered, Leaves reniform serrate, Calyxes acute, Stipules entire
3058 Stem 1-flowered, Leaves cordate toothed
3059 Leaves linear lanc. toothed, Stipules linear entire, Spur very obtuse much shorter than calyx
§3. Stipules pinnatifid, Stigma cup-shaped.
3060 Stem ang. diffuse, Leaves oblong toothed crenate, Stipules lyrate pinnat. Cor. twice as long as smooth cal 3061 Stem. ang. dec. diffuse, Lower lvs, cord, upper ovate obl. toothed cren. Cor. scarcely longer than smooth cal, 3002 Stem angular decumb, diffuse, Leaves ovate oblong toothed crenate, Cor. scarcely longer than hairy cal. 3063 Caulesc. smooth, Leaves thickish ovate and oval cren. Flowers inverted wavy, Petals rounded broad renif, 3064 Stem angular diffuse and leaves oblong serrated hairy, Stipules lyrate pinnatifid, Cor, twice as long as cal. 3065 Stem 3-cornered simple, Lvs, obl. toothed, Stipules palm. many-cleft, Petals crenate, Spur as long as cal. 3066 Stem 3-cornered simple, Leaves ovate oblong crenated ciliated, Stipules palmate cut 3067 Stem 3-cornered simple, Leaves oblong, Stipules pinnatifid
3068 Stem very short erect, Leaves roundish crenate, Stipules entire, Flower-stalks 3-cornered

and Miscellaneous Particulars.
Desfontaines says it is frequent about Cassa and Tozzer, in Barbary, in the palm groves; the blue and white growing promiscuously and flowering in winter. Hasselquist found it in Palestine, Thunberg in Japan, and Loureiro in China, near Canton. The double purple and the Neapolitan are the most esteemed varieties: the latter forces well, and where there is a stove or warm pit, may be had from Christmas to April, when others are in flower in the open air.

In medicine, the flowers of violets act as a laxative, and the syrup is used by chemists to detect an acid or an alkali: for this purpose the V. odorata is cultivated to some extent at Stratford upon Avon. (Withering.)

History，Use，Propagation，Culture，
V．hirta and canina bear a considerable resemblance to V ．odorata；but the first may be distinguished by its hairy petioles，and the last by its flowers being inodorous．
$\mathbf{V}$ ．arborescens is readily propagated by young cuttings planted under a hand－glass．
541．Ionidium．From iov，a violet，and Eisos，similar，on account of its resemblance to a violet，from which it is by some thought not to be generically distinct．
542．Phylica，in Greek ¢i入uxe，and should therefore be written Philyca．The plant of the ancients is not known．Some think it was the Holly．P．ericoides occupies large tracts of ground about Lisbon，in the same manner as heath occupies many lands in England．Young cuttings of all the species root readily in sand under a bell－glass．

544．Conocarpus．From zayos，a cone，and жкœтos，a fruit ：its fruit resembles the cone of an alder．Tropical trees，with alternate entire leaves and small heads of yellowish flowers．
545．Cyphia．From zu申os，curved，on account of its curved stigma．Small Cape plants resembling Lobelia．

3069 Stem short, Spur subulate longer than petals, Leaves somewhat ovate, Stipules toothed
3070 Stem ascending 3-cornered, Leaves cordate crenate, Spur subulate longer than calyx, Upper petal acum.
3071 Stem ascending, Leaves opposite sessile and stipules lanceolate, Flowers nodding longer than leaves 3072 Leaves ovate obl. Pedunc. axillary solitary drooping, Lower lip very large emarginate

3073 Leaves linear lanceolate obtuse revolute at edge smooth, Branches umbeiled, Heads round downy
3074 Leaves subulate acute rough somewhat hairy, Branches panicled many-flowered
3075 Leaves scattered linear lanceolate hoary beneath, Heads terminal hairy
3076 Leaves linear lanceolate villous, Bractes woolly, Heads terminal
3077 Leaves linear lanceolate acute spreading villous hoary beneath, Bractes colored villous very long
3078 Leaves linear hairy tomentose beneath revolute at edge, Heads terminal, Flowers downy
3079 Leaves linear flattish hoary beneath erect, Heads ovate downy
3080 Leaves linear lanceolate revolute at edge hoary beneath, Flowers axillary solitary racemose
3081 Leaves linear subulate very villous, Flowers terminal axillary, Cor. spreading
3082 Leaves linear upper villous, Flowers racemose
308.3 Leaves linear revolute at edge rough hoary beneath, Stipules filiform colored, Bractes bifid naked

3084 Leaves cordate ovate spreading, Stem proliferous
3085 I eaves ovate scattered opposite and three together beneath netted veiny tomentose
3086 Leaves oblong cordate acuminate beneath hoary, Spikes cylindrical, Flowers length of bractes
3087 Leaves ovate mucronate smooth above and shining beneath hoary, Racemes leafy panicled
3088 Leaves oblong cordate acuminate hairy beneath white, Flowers in heads
3089 Leaves cordate ovate smooth, Flowers racemose
3090 Leaves linear lanc. revolute at edge villous hairy beneath, Flowers cylind. Bractes as long as flowers
3091 Leaves ovate smooth, Flowers simple panicled racemose
3092 Leaves acerose flat on each side very 3mooth, Flowers panicled racemose
3093 Leaves linear ciliated arcuate spreading, Head terminal
3094 Branches square, Leaves opposite stalked lanceolate ovate entire smooth

3CM5 Erect, Leaves lanceolate
3096 Procumbent, Leaves obovate
3097 Leaves entire and toothed linear, Stem twining
$3(18$ Leaves digitate, Leaflets pinnatifid, Stem erect
$309 y$ Leaves oblong crenated ciliated, Scape erect

3100 Leaves and petals lanceolate
3101 Leaves subulate, Petals linear
3102 Leaves linear lanceolate narrow at the base hispid wavy curled
3105 Leaves linear smoothish fiat obtuse
3104 The only species

3105 Leaves ovate 3-5-angular and 3-5-lobed floral ovate acuminate veiny, Umbels erect

3106 Leaves elliptical entire, Racemes compound terminal, Flowers sessile in small heads

and Miscellaneous Particulars.
546. Lightfootia. Named after the Rev. John Lightfoot, an English clergyman, and author of the first Flora Scotica. The genus is very nearly related to Campanula, from which it is by some thought not different.
547. Jasione. A name applied by Pliny to an eatable plant. J. montana so resembles Scabiosa, as to be often mistaken for a plant of that genus. Linnæus gives a curious account of the process of fecundation in this plant, from which may be observed its affinity to Syngenesia, where it was first placed.
548. Lagocia, From $\lambda \alpha \gamma \omega 5$, a hare, and weos, a residence. The little seeds enveloped in the downy involucrum have been likened to young leverets in a hare's form. The seeds should be sown in autumn soon after they are ripe, otherwise, if this is deferred till spring, they commonly remain a year, and sometimes two or three years, before they grow.
549. Hedera. A name for which many etymologies have been offered. The best explanation is, that it has been derived from hedra, sord, in Celtic. Lierre, Fr. H. helix is a valuable ornamental evergreen for covering naked buildings or trees, for training into fanciful shapes, as of human figures, \&cc. on skeletons of wirework, or trained wip a stake so as to form a standard. Flowering so late in the season, it is much resorted to by

## 1. Unarmed. Currants

3107 Leaves smooth pendulous, Flowers flattish, Petals obcordate, Leaves obtuse 5-lobed, Stem erect $\beta$ Berries yellow
$y$ Lobes of leaves shortish, Leaf-stalks, Flower-stalks, and Flowers pubescent
3108 Rac, rather hairy when in flow. erect afterw. pendul. Brac. shorter than flow. Lvs. acum. lob. cut toothed, 3109 Racemes spiked pendulous, Petals oblong, Bractes shorter than flowers
3110 Spikes erect, Petals oblong, Bractes shorter than flower
3111 Leaves moderately lobed smoothish above pub, beneath, Flowers small, Sepals trifid, Berries red harry
3112 Racemes erect, Flowers flat, Leaves obtusely lobed, Stem procumb. [fruit stiffly upr. Ber. rough red
3113 Branc. upr. Leaves smooth above beneath pub. nett. Lob, and teeth acute, Rac. loosely many-fl. always in 3114 Stems prost. Lvs, lobed smoothish younger pub. Rac, nearly erect, Petals deltoid, Bract. min. Berr, hispid 3115 Racemes erect, Bractes as long as flowers or longer, Peduncles hairy with glands, Lvs. shining beneath 3116 Very smooth, Lvs. 3-lobed, Lobes spreading with a few teeth, Bract. lin. as long as f.,-stalks, Berries smooth 3117 Lvs. dotted beneath, Racemes hairy loose, Flow. campan. Brac. shorter than fl.-stalks, Ped. simple at base 3118 Leaves dotted on each side, Racemes pendulous, Flowers cylindrical, Bractes longer than germen 3119 Leaves cordate 5-lobed cut-toothed smooth, Stalks slender, Racemes loose erect the length of leaves 3120 Glandular hairy, Rac, erect, Lvs. 5-lobed obtuse cren. roundish, Bractes lingulate longer than fi.-stalk

## 2. Prickly. Gooseberries

3121 Spine one under the axillæ, Branches hispid, Lvs. small $\frac{\lambda}{2}$-trifid: lobes toothed, Berr. solitary smooth red 3122 Spine under axillary very short, Lvs, on slend. stalks pub. on both sides: lobes acute cut and toothed, Ped. 3123 Prickles solitary, Peduncles 2 or 3-flowered, Berries polished
[capillary
3124 Somewhat prickly, Leaves round cut-lobed hairy, Racemes short, Berries rough with hairs
3125 Prickles twin or solitary, Leaves wedge-shaped 3-parted and obsoletely 3-lobed toothed, Fl, racemose erect
3126 Branches somewhat prickly reclinate, Bract. of the peduncle 3-leaved
3127 Leaf-stalks hairy, Peduncles 1-flowered, Bractes 2, Fruit hairy
3128 Peduncles 1-flowered, Bractes connate-tubular, Fruit smooth
3129 Branches prickly all over
3130 Spine sub-axillary compound, Stem hispid all over, Leaves lobed beyond middle, Berries racemose hispid 3131 Prickles sub-axiliary, Berries prickly racemose dull brown

3132 Leaves like those of the vine stinging cirrhose
3133 Leaves roundish ovate acuminate, Calyxes reflexed pressed close to the spike
3134 Leaves obovate acute narrowed at base, Calyxes reflexed pressed close to the spike
3135 Leaves ovate lanceolate opposite, Spikes elliptical corymbose on long stalks, Stem shrubby
3136 Leaves whorled ovate downy, Corymbs compact dichotomous, Flowers with corollas
3137 Stem erect, Ovate leaves and calyxes smooth
3138 Stem erect rounded and elliptical oblong leaves pubescent, Spikes axillary and terminal stalked

of the black currant, which are therefore not much used in the kitchen or dessert, and seldom in wine making. They make a jelly or jam in estimation as a gargle for inflammatory sore throats,

The culture of the black currant is similar to that of the red; but as it is less apt to beax on spurs than on young wood, the shoots are not so much shortened in this as in the other. It is singular that no varieties have been raised of this species, nor will it produce hybrids, as far at least as has been tried with the other cultivated sorts of Ribes.
R. Grossularia and R. uva crispa are the rough and smooth gooseberries; Groseille, Fr., Johannisbeere, Ger., and Uvaspina, Ital. ; in universal culture and estimation in Britain, but not much known or esteemed in any other country. The climate of France, Italy, and Spain is too warm; and the summers of many parts of the north of Europe too rapid for their attaining a good size. They are, however, more in vogue now in the latter countries than they have ever been before; but as the quality of the frult soon degenerates when the plants are not kept in high cultivation, it can never become very popular in countries where the pear, vine, fig, and olive grow freely, and which being planted and once established in the soil, grow and bear for ages with very little care.

The varieties of the gooseberry are very numerous, and yearly increasing in Lancashire and other counties where the fruit is grown for prizes, by raising from the seed. These new varieties, however, are valued more according to the size of the berry, than its flavor, or the prolificacy of the plant; so that few so originated are fit to be added to the list of table or kitchen fruit. Twenty-five pennyweights is considered a great weight for a gooseberry, hut some have been raised a few dwts. heavier. (See the Manchester Gooseberry Book, pub, annually.)

The gooseberry is generally propagated by cuttings, and trained as a dwarf bush, or sometimes on espalier rails : one variety, the green-gage, makes very neat half-standards, and bears better in that state than as a bush. They require a loany soil, an open airy situation, and yearly attention to pruning, and refreshing their roots with manure and stirring the surface.
551. Gronovia. In honor of John Frederick Gronovius, a learned botanist at Leyden. This is a trailing plant like the cucumber, with broad hairy leaves, which sting like the nettle. Treated like the melon, it will produce ripe seeds, but is a plant of neither beauty nor use.
 envelopes. This genus is of easy culture, but little beauty. All root freely by cuttings. A. porrigens is the only handsome species.

History, Use, Propagation, Culture,
553. Philoxerus. From ¢i $\lambda 05$, a lover, and gneos, arid; a plant delighting in sandy soil. The species resemble Gomphrena or Achyranthes.
554. Desmochata. From $\delta \varepsilon \sigma \mu \circ 5$, a bond, and $\chi \alpha e \tau \varepsilon$, a sheath, in allusion to the coherence of the flowers in their heads. It was called Pupalia by Jussieu, from its Malabar appellation. Plants nearly related to Achyranthes, in which they were included by Linnæus.
555. Illecebrum. A name of Pliny, designating a kind of wild purslane. It is now applied to singular little weed-like plants, with white scarious stipules to their leaves.
556. Alternanthera; that is to say, alternate anthers, those organs being by turns fertile and barren.
557. Paronychia. Something which cures whitlows, or maladies of the finger nails, called by the Greeks rogoy $x^{s 6 c}$. These are dwarf plants which grow in light soil, and are well adapted for pots or rock-work.
558. Chenolea. From $\chi$ yv, a goose, and olea, an olive. The leaves are sitvery, like those of the olive; the plant humble like the Goosefoot. This plant is noticed for its silvery leaves: it is propagated by young cuttings planted under a hand-glass.
559. Anychia. A word with the same meaning as Paronychia (in No. 557.), and a genus with similar habits.

3139 Stems creeping, Leaves rounded fleshy, Heads solitary terminal oblong
3140 Stem erect shrubby, Leaves ovate oblong acuminate, Heads round stalked leafiess
3111 Stem $\frac{1}{8}$-shrubby spreading smooth, Leaves opp. ovate acum, roughish, Flowers with long purple bristles
3142 Stems shrubby prostrate, Leaves opposite ovate, Fascicles of fowers remote spreading at length reflexed
3143 Stem shrubby spreading, Leaves alternate ovate naked, Fasc. of flowers remote ovate, Bristles callous
3144 Stem erect, Leaves alternate ovate smooth, Racemes many, Fascicles ovate remote, Bristles callous
3145 Stem shrubby spreading pubescent, Flowers in round prickly spikes
3146 Stems filiform smooth, Leaves roundish, Calyxes 5-cornered bearded
3147 Stem branched erect, Leaves rounded smooth bearded, Flowers cymose, Bractes very short
3148 Stem branched prostrate, Flowers clustered axillary naked, Calyxes ventricose beneath hairy
3149 Heads sessile, Flowers smooth three times as long as utricle, Leaves ovate mucronate unequal
3150 Stems creeping hairy, Leaves broad lanceolate stalked, Heads round naked
3151 Heads subsessile, Calyx ovate acuminate nearly as short again as utricle, Leaves ovate lanceolate
3152 Stems creeping smooth, Leaves broad lanceolate stalked, Heads round pubescent
3153 Leaves ovate lanceolate deflexed, Flowers axillary clustered, Cal. spiny, Stem tomentose dichotomous
3154 Stems rising, Leaves carinate oblong ciliated at base, Flowers terminal mixed among the bractes
3155 Stems sub-erect much branched, Leaves spreading villous, Bractes very large concealing the flowers
3156 Stems diffuse, Leaves ovate, Flowers heaped, Bractes shining
3157 Flowers surrounded by shining bracteæ, Stems procumbent, Leaves smooth
3158 The only species
3159 Stem dichotomous, Leaves lanceolate: of the stem opposite, of the branches altern. Flowers sol. axillary
3160 Stem herbaceous erect, Flowers lateral woolly, Leaves alternate ovate
3161 Leaves lanceolate downy, Spikes cylindrical numerous terminal
3162 Leaves ovate oblong, Stem rising panicled, Spikes alternate terminal remote
3163 Leaves ovate acuminate flat, Raceme loose, Bractes scarious, Pistil trifid
3164 Shrubby smooth, Cauline leaves spatulate, Stem leaves lanceolate, Flowers heaped spiked
3165 Half shrubby erect, Branches diffuse, Leaves nearly opp. hastate entire smooth
3166 Shrubby erect, Branches unarmed, Leaves entire linear oblong and lanceolate flat beneath powdery
3167 Leaves cordate acuminate, Raceme spiked loose, Flowers trigynous
3168 Stems depressed jointed smooth, Leaves oval obtuse entire red at edge
3169 Leaves linear Lanceolate, Stipules falcate, Peduncles angular, Spikes scarious ovate cylindrical 3170 Leaves ovate acuminate, Stipules falcate, Common peduncle striated, Spike oblong compressed 3171 Spikes cylindrical comose, Leaves lanceolate
3172 Leaves ovate upright without auricles, Stem furrowed, Spikes multiple crested
3173 Flowers panicled nodding, Leaves lanceolate, Stem ribbed
3174 Leaves lanceolate ovate lined very much acuminate, Spikes crested, Stipules falcate
3175 Leaves subulate whorled, Stem branched straggling, Spikes compact cylindrical
3176 Leaves wedge-shaped acutish, Spikes globose lateral

and Miscellaneous Particulars.
560. Ǎrua. From its Arabic name êroùâ. Little weeds like Illecebrum.
561. Lestibudesia. Named by M. du Petit Thourrs, after Fr. Jos. Lestiboudois, a Flemish botanist, author of a work called Botanographie Belgique, published in 1781 . The species are readily increased either by seeds or cuttings.
562. Rhagodia. From parwors, bearing berries. The fruit is a small berry, by which character the genus is chiefly distinguished from Chenopodium.
563. Deeringia. Named by Mr. Brown, in memory of Dr. Charles Deering, author of a Flora of Nottingham, and a skilful botanist of his day. Weak shrubs, with terminal spikes of flowers, and a berried inffated pericarp.
564. Trianthema. From revs, three, and avios, fowers. The flowers are frequently placed in threes in the axillæ of the leaves. Little tropical weeds.
565. Celosia. From eq入eos, burnt, because the flowers of some species appear as it were singed. C. cristata is a well known tender annual, of which there are many varieties, as in the balsam, and which, like that plant, will attain a large size and singular beauty by repeafed shiftings. Thunberg states that the fowers or crests are frequently a foot in length and breadth in Japan. T. A. Knight sent a flower to the Horticultural Society

History, Use, Propagation, Culture,
which measured eighteen inches in width, and seven inches in height from the top of the stalk, thick, full, and of the most intense purplish red. (Hort. Trans. iv. 322.) To produce this, the great object was to retard the protrusion of the flower-stalk. Hence, a rich compost was employed, the plants put first into pots of four inches diameter, and then transplanted to others a foot in diameter; the object being not to compress the roots, as that has a tendency to accelerate the flowering of all vegetables. The plants were placed close to the glass in a heat of from 70 to 100 degrees, all side branches removed, and pigeon-dung water used in watering. Had the shiftings from pot to pot been more frequent, it appears probable the size might have been still greater.
566. Gomphrena. Gromphrena is a name applied by the ancients to a plant bearing red and green leaves on the same stem; probably our Amaranthus tricolor. G. globosa is a popular tender annual, valued for its heads of flowers, which, if gathered before they are too far advanced, will retain their beauty several years. The other species propagate readily by cuttings under a glass.
567. Mollia. So called from its softness. The species are small weeds.
568. Glaux. From $\gamma \lambda$ rev\%toy, a name under which Dioscorides describes a maritime plant with glaucous leaves. This plant is maritime, and has glaucous leaves. A pretty little plant, and well adapted for pots and rock work. It will grow at a considerable distance from the sea in sand kept moist.
569. Thesium. Athenæus says, on the authority of Timachides, that this plant was called 9 no हैsoy, because it formed part of the garland presented by Theseus to Ariadne. If this be so, the accent should be placed on the penultimate and not on the antepenultimate syllable. It is, however, very certain that the Thesion of the ancients had no resemblance to that of the moderns, which is a genus of little obscure plants or weeds.
570. Heliconia. A name given to this plant in an ingenious sense, as indicating its affinity with Musa. H. Bihai is a large herbaceous plant, bearing considerable resemblance to Strelitzia. It grows in rich well

3177 Stem erect hairy, Leaves oblong pubescent, Heads globose solitary 2-leaved, Keels of bracteæ winged
3178 Leaves lanceolate, Heads 2-leaved, Florets distinguished by a peculiar perianthium
179 Hairy twining
3180 Stem ascending, Leaves oblong silky beneath, Spikes clustered panicled terminal interrupted
3181 Stem branched diffuse, Leaves spatulate whorled about 7, Calyxes with a membranous margin 3182 Stem branched diffuse, Leaves lanceolate silky bearded

## 3183 The only species

3184 Spike branched, Bractes 3, Leaves linear lanceolate with a very short tube to the calyx
185 Stems prostrate simple, Raceme terminal leafy l-sided, Flowers sessile surrounded by bracteæ
3186 Stem erect simple, Raceme leafy, Flowers stalked without smaller bracteæ
3187 Leaves obovate mucronate, Flowers racemose
3188 Leaves cordate stem-clasping, Racemes terminal
3189 Leaves at the base and end acute, Spadix erect radical, Spathes 2ranked many-flowered
3190 Leaves narrowed at base at end acumin. Spadix erect flexuose radical, Spathes 2-ranked many-flowered 3191 Leaves very smooth nerved rounded at base, Inflorescence very smooth, Spadix erect without bracter

3192 Scape half as short as leaf-stalks which are hardly twice as long as the 6 feet leaf
3193 Scape scarcely longer than the leaf-stalks which are three times as long as the oval leaf
3194 Scape longer than leaf-stalk and leaves, Leaf-stalk twice as long as the ovate oblong leaf
3195 Scape a little longer than the leaf-stalks which are half as long again as the obl. leaf unequal at the base 3196 Scape as long as leaf-stalk which is 7 times longer than the lanceolate leaf
3197 Scape the length of the leaf-stalk which is 20 times longer than the linear lanceolate leaf
3198 Scape as long as leaf-stalk which is twice as long as the ovate concave leaf
3199 Leaf-stalk very long with no leaf

## DIGYNIA.

3200 Stem upright herbaceous, Leaves ovate smooth on each side, Cymes terminal smooth 3201 Stem upright herbaceous, Leaves oblong tomentose beneath, Cymes lateral longer than the leaves 3202 Stem erect herbaceous, Leaves oblong cordate smooth, Cymes shorter than the leaves 3203 Stem' erect herbaceous, Leaves elliptical lanceolate mucronate at the edge rough with little teeth

3204 Leaves oblong ovate thick at edge, Panicle downy
3205 Leaves oval lanceolate acuminate, Panicle smooth
3206 Flowers terminal hairy inside
3207 Flowers smooth, Segments olutuse, Cymes trichotomous. Teaves oblong lanceolate veiny smooth

and Miscellaneous Particulars.
shaded gullies in moist woods. The berries are small and succulent, and each contain three hard rugged seeds.
H. Psittacorum bears a great resemblance to Canna : it grows in the wet parts of wools, and on the highest mountains. All the species require a strong heat to make them fower freely.
571. Strelitzia. So named by Sir Joseph Banks, in honor of Charlotte, queen of George III, of the family of Mecklenburgh Strelitz, and said to have patronized botany. This is a splendid genus, generally kept in the stove; but which, Sweet observes, "will thrive, and flower as well in the greenhouse or conservatory. A light sandy loam is the best soil for the species, and they may be increased, but slowly, by suckers. By rubbing the pollen on the stigma, when the plants are in bloom, perfect seeds are readily obtained." (Bot. Cult. 111.)
572. Apocynum. From aro, away, and zuoy, a dog; that is to say, a plant from which dogs must be driven. Pliny says his Apocynum is mortal to them. This is a genus of plants of little beauty, but of easy culture in any soil. The first species is acrid and blisters the skin. From the stalks of A, cannabinum the Indians of North America prepare a substitute for hemp, of which they make twine, bags, fishing-nets and lines, and linen for their own wear
 round fruit like an apple, and having a twining stem by which it climbs trees. It is a very smooth shrub, with oblong-ovate leaves, and nearly allied to Rauwolfia. Cuttings root readily in sand under a hand-glass. This, and the succeeding genera, as far as No. 592, are all Asclepiadeous plants, and require nearly similar management
574. Periploca. From $\pi \varepsilon g \kappa \pi$.osy, intertwining, in allusion to the habit of the plants. P. græca is a handsome climber, and grows freely in common garden soil, and is propagated by cuttings under a glass, or by layers

History, Use, Propagation, Culture,
57.5 Cryptostegia. From zevtros, concealed, and $5 \in \gamma^{n}$, a covering. The name was suggested to Mr. Brown by the circumstance of the enclosure of the corona within the tube of the corolla, and its not being exposed to view, as in the other neighbouring genera.
576. Hemidesmus. From \%ौurvs, half, and $\delta \varepsilon \sigma \mu o s$, a bandage; in allusion to the incomplete coherence of the anthers with the stigma, by which the genus is principally distinguished from Periploca. Cuttings root readily in sand in heat.
577. Sccamone. The meaning of this word is very obscure. None of the explanations which have been offered of it are even tolerable. Culture as in Periploca.
578. Microloma. From usぇgos, small, and $\lambda \tilde{\omega} \mu \infty$, a fringe; but the application is unexplained by the author of the name. Small climbing shrubs, with opposite leaves and interpetiolar umbels.
579. Sarcostemma. From $\sigma \propto \rho \sigma \sigma$, flesh, and $\Sigma \varepsilon \mu \mu \alpha$, a crown; on account of the thick succulent nature of the coronal processes.
580. Dremia. Dæmia appears to be an Arabic name. It has been applied by Forskâhl to a species of Asclepias referred hither. A genus of twining plants.
581. Cynanchum. From zyay, a dog, and ayxery, to strangle. A word having the same meaning and application as Apocynum. This is a genus of low shrubs and herbaceous plants, for the most part twining, and all of easy culture and propagation.
582. Uxystcima. From o乡vs, sharp, and $\sigma \in \lambda \mu x$, a crown; the corona being very much pointed.
583. Gymnema. From rufevos, naked, and у $\tilde{\sim} \mu \propto_{3}$ a thread, or, in botanical language, stamen; in allusion to

3208 The only known species
3209 Spikes axillary imbricated, Leaves elliptical obtuse mucronate, Stem smooth
3210 Flowers hairy inside panicled, Leaves lanceolate elliptical
3211 Flowers smooth, Corymbs few-flowered axillary, Leaves linear lanceolate without veins
3212 J,eaves sagittate pubescent, Limb of the corolla acute
3213 Stem twining perennial leafless
3214 Stem twining shrubby, Leaves cordate acute, Flowers hairy at edge
2215 Leaves oblong ovate cordate acute, Segments of cor. oblong obtuse
3216 Leaves reniform contracted at end $\frac{1}{2}$ lanceolate, Segm, of cor. lanceolate obtuse
3217 Leaves cordate ovate obtuse fleshy with a little point smooth, Crown 10-cleft as long as corolla
3218 Leaves ovate acute and calyxes hairy, Crown 10 -cleft as long as corolla
3219 Stem erect, Flowers beardless, Partial stalks of umbel twice as long as common stalks, Crown 5-lobed
3220 Stem climbing upwards, Fl. bearded, Partial stalks of simple umbel scarcely longer than common stalk 3221 Leaves lanceolate linear opposite and three together, Stem decumbent
3222 Stem twining upwards, Corollas beardless, Stalks of umbel divided, Corona 5 -lobed
3223 Leaves oblong cordate acuminate wavy, Úmbels axillary proliferous
3224 Stem hairy, Leaves heart-shaped mucronate, Umbels axillary proliferous
3225 Leaves cordate ovate acuminate, Umbels simple solitary, Partial flower-stalks longer than common one
3226 Cor, smooth rotate, Racemes axillary, Leaves linear lanceolate veiny
3227 Leaves rounded ovate netted pubescent beneath, Flowers in umbels
3228 Segments of cor. spreading
3229 Segments of cor. reflexed involute

## 3230 Leaves thick fleshy ovate

3231 Leaves sessile oblong lanceolate wavy smooth, Umbels lateral, Petals ciliated
3232 Leaves ovate oblong smooth obtuse with a point
3233 Leaves cordate lanceolate wavy hispid
3234 Leaves linear lanceolate smooth
3235 Leaves oval downy beneath, Stem simple, Umbels nodding
3236 Stem erect simple, Leaves broad ovate oblong acute smooth paler beneath, Umbels nodding 3237 Stem simple downy in two rows, Leaves subsessile oblong oval downy beneath

the peculiar structure of the stamens. The milk of Gymnema lactiferum is used instead of the Vaccine ichor, and the leaves are employed in sauces in the room of cream.
584. Calotropis. From zados, beautiful, and res\% , to turn, in allusion to the beauty of the flowers, which continually turn towards the sun. This is a handsome free-flowering genus. Young cuttings root freely in sand under a hand-glass, but not crowded, as, if the leaves are injured, they are very apt to damp and get mouldy.
585. Dischidia. From $\delta \delta \xi$, twice, and $\sigma \chi^{\circ} \delta \omega$, to split; but the application is unexplained. Little trailing plants with small opposite fleshy leaves.
586. Xysmalobium. From そucuse, a fragment of a thing, and $\lambda o$ ßos, a division, on account of the minute alternate divisions of the corona. The flowers of this genus are very large; those of $\mathbf{X}$. grandiflorum are of the size and color of Fritillaria meleagris.
587. Gomphocarpus. From youpos, a club, and zo९жо5, fruit. A genus resembling Asclepias in habit, but well distinguished by the inflated club-like fruit.
588. Asclepias. The name of many ancient physicians. It is the Greek name of the Æsculapius of the Latins. This is a genus of tall-growing herbaceous plants, which thrive best in peat or any very light soil. They require a good deal of room to show their characters, and are readily propagated by seeds or dividing the roots. A. syriaca is very odoriferous, and in Canada, when in flower, charms the traveller, especially when passing through woods in the evening. The French there eat the tender shoots in spring as we do asparagus. The natives make a sugar of the flowers, gathering them in the morning when they are covered with dew, and collect the cotton from the pods to fill their beds. On account of the silkiness of this cotton, Parkinson calls the plant Virginian silk.
A. nivea has jointed fleshy roots, the juice of which is very effective in bringing away worms. The root

History，Use，Propagation，Culture，
dried and reduced to powder，is frequently used by the negroes as a vomit，and hence its name of wild or bastard Ipecacuanha．
A．vincetoxicum（tame－poison）is so named because it was formerly esteemed an alexipharmick ；and it is called swallow－wort from the fancied resemblance of the follicles or seeds to a swallow flying．
589．Gonolobus．The derivation and meaning of this word have not been explained．The genus consists chiefly of climbers of little beauty but easy culture．
590．Pergularia．From Pergula，trellis－work，which the plants are very proper for covering．This is a climbing genus，much valued for the fragrance of its flowers．It grows well in loam and peat，and cuttings root freely in sand under a hand－glass．
591．Marsdenin，So named by Mr．R．Brown，after William Marsden，Esq．the author of the excellent

# 3238 Stem simple, Leaves ovate villous beneath, Umbels erect, Nect. resupinate <br> 3239 Leaves ovate rugose naked, Stem simple, Umbels subsessile, Flower-stalks downy <br> 3240 Leaves stalked lanceolate smooth shining, Stem simple, Umbels erect solitary lateral <br> 3241 Leaves ovate-lanceolate smooth, Stem simple, Umbels erect lateral solitary <br> 3242 Leaves lanceolate acuminate smooth narrowed at base, Stem half shrubby erect, Umbels lateral solitary <br> 3243 Leaves lanceolate smooth, Stem divided upwards, Umbels erect in pairs <br> 3244 Leaves lanceolate pubescent beneath, Stem divided upwards, Umbels erect in pairs <br> 3245 Leaves villous, Stem decumbent <br> 3246 Stem erect simple downy in lines, Leaves very narrow linear mostly whorled <br> 3247 Stem decumbent and leaves very long linear pubescent, Appendages of crown without horns <br> 3248 Stem erect hairy with spreading branches at end, Leaves scattered lanceolate hairy <br> 3249 Leaves linear subulate channelled, Umbels stalked nodding: lateral many-flowered 

3250 Runners and leafstalks very hairy, Lvs. acum. by degrees perceptibly hairy on both sides, Foll. muricated 3251 Runners smoothish, Leaves conical cordate acute by degrees, Flowers and follicles smooth
3252 Leaves cordate acuminate with the sinus open
3253 Leaves cordate, Corymbs axillary, Common flower-stalk longer than the leafstalks Cor. discolored
3234 Leaves oblong cordate with the sinus closed, Petals crisp at end
3255 Villous, Leaves oblong elliptical lanceolate cordate, Crown at bottom of tube
3256 Leaves cordate acuminate, Cal. shorter than tube of cor.
32.57 Leaves cordate obtuse with a point, Cal. as long as tube of cor.

3258 Leaves ovate lanc. very smooth, Cymes shorter than leaves, Sap blood-colored
3259 Stem erect, Leaves cordate ovate acute, Cymes umbellate, Flowers not bearded 3260 Stem somewhat erect, Leaves oval-lanceolate smooth veinless, Tube inflated, Orifice bearded
3261 Leaves ovate, Flowers bearded
3262 Leaves ovate-lanceolate acute small
3263 Leaves obovate obtuse very thick
3264 Leaves cordate
3265 Leaves oblong slightly cordate at base with 3 distinct nerves
3260 Stems upright jointed rounded, Leaves linear acute
3267 Leaves lanceolate sessile, Peduncles 2-flowered, Stem fleshy
3268 Leaves smooth with an edge, Peduncles simple, Calyx very smooth
§1. Cor. 5-cleft with no ball. Crown double: the outer with the ligules united at base; inner with the appendages united upwards into a beak, downwards expanded into a wing. (True Stapelia.)
3269 Branches quadrangular clavate: angles with remote incurved teeth, Seg. of cor. lanc. acute fringed at edge 3270 Segments of cor. fringed with white covered at base with very close long red hairs black at end, beyond mid. striped with pale
3271 Branches erect 4-ang. clav. Angles toothed rem. incurv. Cor. large flat with lanc. hisp. seg. fring. at edge 3272 Branches spreading 4-ang. Angles toothed, Teeth remote acute incurved, Cor. whole color. vil. in middle 3973 Cor. flat cil. rugose above in mid. hairy otherwise smooth, Beak sub. ac. Wings obl. obt. 1-tooth. inside
3274 Stam. deltoid with inner process recurved unguiculate, Top of style impressed with the mark of a cross 3275 Branches sq. erect velvety, Teeth erect, Disc. of fls. shining hairy with ovate-acum. revolute ciliated seg. 3276 Fls. flat smooth rugose crosswise, Beaks subul. gibb. Ligules lanc. acum. Bran. fl.-bearing about the mid. 3277 Branches four together large equal sided with flat pubescent angles
3278 Branches several erect square toothed, Teeth short erect, FI. large, Segm. lanc. ciliated revolute at edge 3279 An obscure species said to be cultivated in the gardens, but of which nothing is known
3280 Flowers fat ciliated hairy all over the disk, Beaks subulate acute with a broad acute wing at the back
3281 Fls . flat cil. rugose above hairy in centre, One or more of teeth hooked, Wings parallel with erect beaks
3282 Fl. cil. Disk flat shaggy in mid. Segm. at first deflexed afterwards spreading, Wings obl. trunc. crenulate
$\beta$ Differs chiefly in the dark color of the flowers which are clustered and not solitary
3283 Segm . of fi. lanc. acum, Ligules linear lanc. wavy, Branches erect square with erect teeth
3284 Branches reclinate, Segm. of fl , rounded rugose acuminate ciliated; the bottom elevated closely hairy

and Miscellaneous Particulars.
History of Sumatra, in which one species, used as Indigo in the island is figured. Little neat shrubs, with axillary bunches of small white sweet-scented fowers.
592. Hoya. Named after Mr. Thomas Hoy, for many years gardener to the Duke of Northumberland. He died about 1821. H. carnosa is of easy culture, flowers frecly, and is propagated by cuttings in a moist heat. Its flowers are very mellifluous, and it has heen said that one or two plants, placed when in flower in a vinery of ripe grapes, will entice the wasps from eating the fruit.
593. Ceropegia. From «rgos, wax, and Trir, a fountain; literally, a fountain of wax, poetically, a candelabre; on account of the umbels of bright yellow flowers. Curious naked plants with tumid fleshy stems. Same culture as Hoya
ist4. Stapclia. So named by Limneus, in memory of Bodeus ì Stapel, a physician of Amsterdan, com-

History, Use, Propagation, Culture,
mentator on Theophrastus, 1644. This is a genus of singular plants, without leaves, diminutive, very succulent, and some of then with flowers large in proportion to the plant, curions, and often smelling very disagreeably. They are mostly natives of the deserts or Africa, and have been chiefy discovered by Masson,

3285 Flowers cuspidate rugose scabrous ciliated, Beaks half split
3286 Branches and branchlets upright square quite smooth, Angles toothed, Teeth erect, Flower flat hispid 3287 Branches many erect square, Angles toothed, Teeth erect acute, Cor. covered with clavate glands 3288 Cor. very villous with white spatulate hairs, Ligules minute rhomboid-oblong entire
3289 Branches several suberect 4-cornered toothed, Flower flat smooth rugose, Segments caudate
3290 Pedunc. aggreg, rad, much longer than cor. Segm. acum. hispid with clavate hairs, Beaks subul, conniving
3291 Branches many divaricating square toothed, Flower flat with ovate obtuse rugose segments
3292 Branches many erect square toothed, Flowers clustered sessile, Segm. lanc. acute folded back
3293 Branches many erect square with spreading acute teeth, Flowers solitary stalked, Segm, setaceous
3294 Branches erect square toothed, Teeth spreading acute, Flowers sessile, Segm, lanc. flat
3295 Branches several square toothed recurved, Flower small, Segm. narrow flat spreading fringed at edge 3296 Branches several rounded furrowed tubercled hairy, Flower solitary sessile
3297 Branches and branchlets rounded tubercled spiny, Flowers solitary large 10-cleft
3298 Cor, smooth, Seg. lanc. Fl. stalks shorter than cor. Branches flowering in mid, 6-sid. with prickly tuber.
3299 Joints of branches obl. round, nett. obscurely warted, Spines sin. Cor. wart. above with triangular segm. 3300 Branches several erect sq. with nearly upright acute teeth, Fl. flat rough 5 -cleft with ov. lanc. ciliate seg. 3301 Cor, rugose dark with pink hairs, Branches thick short yellowish green

3302 Cor. ciliated rough above dotted beneath, Ligules erect 3 -parted: middle lanceol. longer than sides 33303 Branches many erect square smooth, Cor. flat smooth with lanceolate obtuse segments 3304 Teeth of branches rounded, Fls, closed ventricose with 5-nerved ov, acum. seg. Beaks split open

3305 Ball spurious depressed 5 crenate in the circumference, Beaks and wings rounded obtuse, Tube of cor. $O$.
3306 Cor. 5-parted flat hairy warted across, Appendages obtuse obscurely toothed, Beaks subulate conniving
8 2. Cor. 5-cleft with no ball. Ligules not connate at base spreading. Appendages lengthened into incurved beaks, gibbous, but not winged at back. (Gunostemon. Haw.)
3307 Branches several sq. divaricat. smooth tooth. narr. by deg. Cor, very smooth 5 -cleft, Seg. lanc. spreading 83. Cor. 5-cleft with a bull. Ligules connate spreading. Appendages lengthened into incurved beaks, not winged. (Podanthes. Huw.)
3308 Much branched weak, Flowers in pairs wrinkled minutely hairy at bottom
3309 Branches many suberect toothed, Teeth spreading acute crossing, Cor, flat rugose, Segm. lanc. acute
3310 Branches many erect with acute crossing teeth, Cor. flat wart. elevated in the middle into a rough table
3311 Cor. 5 -cleft camp. smooth dotted even at bottom, Segm. of outer crown ob. emarg. Inner hooked 2-lobed 3312 Branches severai reclinate with acute teeth, Fl. clustered, Segm. triangular acute with a round centre 3313 Rim obsolete, Beaks rounted obtuse, Wings conical subulate acute spreading, Ligules retuse 3314 Stem square with spreading teeth, Flower stalked, Segm. ovate scaly ciliated
8. Cor. 5-cleft reflexed with no ball. Ligules connate at base. Appcndages lengthened into long beaks with short wings. (Tromotriche, Haw.)
3315 Branches square erect with spreading teeth, Cor, smooth, Segments ciliatcd acute revolute
3316 Segm. of cor, ovate acute fringed revolute, Beaks clavate, Branches square with rounded angles
3317 Branches square toothed, Teeth recurved, Segm. of cor. flat ovate hairy
§5. Cor. 5-cleft, with a large ball in the middle. Ligules connate at base. Appeniages produced into long beaks, and subulate or filiform wings. (Orbea. Haw.)
3318 Cor. 5 -cleft rugose smooth, Segm. ovate-acumin. bent obliquely, Marginal fringe clavate white and violet 3319 Ball solid, Beaks and wings rounded obtuse, Ligules tritid, Cor. flat beneath fringed at mouth
3320 Cor. 5-cleft, Ligules oblong emarginate, Sepals broad ovate acuminate, Branches thick green not spotted 3391 Ball spurious, Beaks rounded obtuse, Wings subulate obtuse spreading, Ligules bifid acute
3322 Cor. sulphur colored with entire ligules
3323 Ball spurious, Beaks rounded obtuse, Wings subulate obtuse spreading, Ligules bifid, Cor, flat beneath 8324 Ball 5 angular, Ligules 2-toothed obt. Appendages diverging the inner clavate the outer subulate obtuse 3325 Cor. fringed at edge with clavate hairs, Ball tumid, Appendages bifid diverging
3526 Cor. rugose across flat dotted in a regular maner, Inner horns hooked obtuse, Ball round tumid
3327 Branches several erect spreading 4-cornered toothed, Ball closely dotted, Segm. rugose cordate striated
3328 Ball spurious, Beaks round. obt. Wings filiform obt. spreading, Ligules bifid obt. Cor, flat with no tube 3329 Ball large, Ligules half divided, Speckles of flower wavy tortuous
3330 Branches simple 4-furrowed torulose, Seg. ov. acum, rugose, Ball elevated rugose depressed in middle
$\$ 6$ Cor. 5-cleft flet with no ball. Ligules none. Appendages produced into a sloort beak and a longer incumbent wing. (Obesia. Haw.)
3331 Cor. 5-cleft strigose, Seg, revolute at edge, Wings hooked incumbent on their beak, Shield 5-lobed fleshy
3332 Joints of stem obl, rounded, Fls. in pairs, Seg, of cor. lanceolate acuminate rough above revolute at edge
\$7 Cor 5-cleft, with the segments folded back. Ligules none. Appendages or beaks simple, with no wings.
(Duvalia. Haw.)
3333 Branches several 4-cornered reclinate with acute spreading teeth, Segm of flower folded back fringed

and Miscellancous Particulars.
a collector for Kew gardens about the end of the last century, and who published a monograph of the genus, I'hey have been divided into several genera by Haworth, who has not been followed by other writers. Some of the species, as S. pilifera and articulata, are eaten by the Hottentots and by the Dutch settled at the Cape

History, L'se, Propagation, Culture,
pickled in vinegar; but in general they are without use. According to Sweet, "the best soil for them is a sandy loam, mixed with old lime or brick rubbish; if planted in a richer soil, they will thrive better for a time, and produce larger flowers; but then they are very apt to rot off, particularly if they chance to get a little too much water: a very little water serves them, except when in flower, when it may be given more freely. They are readily increased by cuttings, which should be laid to dry in the stove, till they begin to shrivel; then planted in pots they will root immediately. If planted as soon as taken off, when full of juice, they are likely to rot. (Bot, Cult. 109.)
595. Piaranthus. From $\pi \alpha \propto 05$, fat, and ay.905, a flower, on account of the fleshy nature of the corolla. The species are only artificially distinguished from Stapelia.
596. Hucrnia. Named after Justus Huernius, an obscure botanist. The species have the same appearance

3334 Branches several clustered oblong toothed, Segm. of cor. 3-angular hispid fringed at edge 3335 Branches clustered procumbent 4-cornered with spreading acute teeth, Seg. of cor, folded back fringed

3336 Branches clustered short with conical acute teeth, Segm. of cor. distant folded back naked
3337 Cor, with seg. refl, at edge and fringed with simple hairs, Bottom rounded elevated, Lig. falcate hooked 3338 Cor. rugose ciliat. pubes, in midd. Seg. revolute at edge all bent down, Beaks subul. Wings scarcely any
6 8. Cor. 5-cleft with no ball. Ligules not connate at base, spreading. Appendages elongated into a bifid rostrum, with globose fungous tips. (Caruncularia. Haw.)
3339 Branches several divar, 4-corn. toothed, Ped. very long, Seg. of cor. lanc. rev. at edge with fringed angles 3340 Branches oblong jointed, Peduncles twin, Cor, revolute at edge with wings and lobes serrated at end

3341 Six-cornered erect with spreading prickles, Flower sessile clustered, Segm. of cor. lanceolate silky above 3342 Joints 4-cornered toothed, Flowers fascicled, Segm. of cor. lanceolate papillose

3343 Branches 5 -cornered toothletted, Cor. with 10 angles, Tube bearded inside and elevated into a ball 3344 Cor. campanulate closed at bottom by clavate horizontal hairs, Ligules spreading truncate dark 3345 Branches 4 and 5 -cornered, Young branches very much spreading, Cor. 10-cleft, Tube smooth 3346 Cor. 10-toothed, Alternate segments obsolete, Branches 5-cornered spreading with hooked tubercles 3347 Cor, concave at bottom, Stems simple above glaucous, The teeth of the branches horizontal
3348 Branches several 4-5 angular spreading, Cor, rounded 10 -cleft, Segm, alternately longer, Flowers solitary 3349 Branches simple very thick 4 - 5 -cornered with very large teeth
3350 Branches several 4-5-cor. clust. nearly erect, Teeth of branches acute spreading, Cor. campanul. 10-cleft
3351 Cor. campanulate dotted inside; not dotted outside, Beaks gibbous, Shield low with 5 emarginate lobes
3352 The only species
3353 Branches distant 4-cornered long slender ascending, Flowers with segments tipped with purple 3354 Branches clustered 4-cornered short thick erect, Flowers in close terminal heads

3355 Cor. 5-cleft, Peduncle 4-cornered, Stem undivided, Radical leaves oval
3356 Cor. 5-cleft rotate whorled, Whorls cymose, Calyxes spathaceous, Leaves broad ovate
3357 Cor. 5-cleft campanulate dotted in streaks whorled, Cal. membranous spathaceous
3358 Cor, 6-cleft campanulate much dotted whorled, Cal. coriaceous truncate
3359 Cor, 6 -cleft campanul. much dotted whorled, Cal. membr. truncated, Lobes shorter than tube of cal. uneq.
3360 Cor. hypocrateriform 5-7-cleft, Intermediate segments torn, Leaves cruciate 3-nerved
3361 Cor. 5-cleft campanulate opp. axillary subsessile, Leaves stem-clasping ovate-lanceolate
3362 Cor. 4-5-cleft sessile whorled, Radical leaves as long as stem which is naked beneath
3363 Cor. 4-cleft naked hypocrateriform whorled subsessile, Stem two edge narrowed at base
3364 Flowers terminal sessile, Cor. 10 -cleft ventricose acute, Alt. segm. shorter entire, Leaves lanceolate
3365 Flowers clustered terminal tub-shaped with an unequal lacerated mouth, Leaves oval
3366 Flowers in whorled heads sessile, Cor. 10 -cleft ventric. closed, Alt. segm, fringed smaller, Lvs, ovate lanc. 3367 Flowers whorled ventricose 10-cleft, Segm, altern. unequally bifid and torn, Lis. remote oppos, and ternate 3368 Cor. 5-cleft campanulate acuminate terminal and axillary stalked, Leaves linear obtuse
3369 Cor, 5 -cleft hypocrat. beard. Seg. ovate, Cal. trunc. with eq. subul. teeth, Lvs. ov. lanc. as long as branches 3370 Cor. campanulate 5-cleft toothed between the segments, Cal. 3-toothed opening on one side, Lvs. lanccolate 3371 Cor. campanulate 5 -cleft clustered sessile, Leaves linear: floral alternate lengthened

3374 Cor. 5-cleft funnel-shaped, Leaves ovate acute: radical spreading larger than the cauline
3375 Cor. 5-cleft funnel-shaped, Leaves ovate obtuse : radical clustered imbricated less than the cauline
3376 Cor. 5-cleft funnel-shaped, Branches alternate 1-flowered, Cauline leaves lanceolate
8377 Cor. 5-cleft monogynous, Panic trichotomous, Bractes perfoliate, Leaves oblong 3-nerved

and Miscellaneous Particulars.
as Stapelia, require the same culture, and are natives of the barren blowing sands of the Cape of Goou Hope.
 processes in the flower of this plant.
598. Caralluma. The Indian name of this plant, which exactly resembles Stapelia in appearance.
599. Swertia. So named by Linnæus, in honor of Eman. Sweert, a cultivator of bulbs and flowers in Holland, and author of Florilegium, 1612. Pretty herbaceous plants, with blue flowers.
600. Gentiana. From Gentius, King of Illyria, who, according to Pliny, first discovered the tonic virtues of plants of this genus. "This is a very handsome genus of herbaceous plants: most of the species succeed well in a light rich soil, but a few require peat, and some must be grown in pots to be protected by frames in winter.

History，Use，Propagation，Culture，
Some of them may be increased by dividing at the root，but most of them seed freely；the seeds should be sown as soon as ripe，they will then quickly vegetate，but if left till spring before they are sown，they will not come up till the second year．（Bot．Cult．371．）

G．lutea has a thick root of a yellowish brown color，and very bitter taste．In Switzerland and Germany it occupies extensive tracts of ground untouched by any cattle．It was formerly used as hops in brewing，and is at present the principal European bitter used in medicine．The root of G．purpurea is as thick as a man＇s arm and two feet long；it is extremely bitter，and used as a substitute for G．lutea．

G．acaulis and verna are two beautiful edging plants，and answer well in pots．
601．Hydrolea．From iowe，water，and $\varepsilon \lambda \propto ⿰ \alpha$, ，oil．It is a water plant，and its leaves are viscous，as if they wore smeared with old oil．A very pretty plant with bright blue fowers

602．Falkia．Named after John Falk，a Swede，born in 1725，died in 1774．He was professor of botany in the apothecaries＇garden at St．Petersburg，and followed Pallas during a part of his journey in Siberia．Upon his return he committed suicide；perhaps the only instance upon record of suicide among naturalists．

603．Dichondra．From $\delta 6$ ，double，and $\chi o y \delta \rho o s$, grain；on account of the double nature of the capsule． Little inconspicuous trailing plants，seldom seen or desired in collections．

664．Velezia．So named by Linnæus，in memory of Christoval Velezius，examiner，first physician，and demonstrator of botany in the college of apothecaries at Madrid．A small weed，native of the south of France，resembling a dried up Gentiana．

605．Bumalda．Named after Ovide Montalban，better known under the name of Jean Antoine de Bumalda， born at Bologna，published in 1657 a Bibliotheca Botanica，and in 1668 a Dendrologia．

606．Heucherd．In memory of Jean Henry de Heucher，archiater，and professor of medicine at Witteberg，

3378 Leaves obovate oblong 3-nerved, Flowers terminal clustered, Cor. ventricose not opening
3379 Cor, campanulate 5 -cleft terminal and axillary clustered, Intermed, segm. torn, Leaves lanc. 3-nerved
3380 Cor. 5 -cleft hypocrateriform bearded, Segm, lanc, acute, Leaves lanc. Branches shorter than joints
3381 Cor. 4-cleft hypocrateriform obtuse, Orifice bearded, Two outer sepals very large
3382 Cor. 4-cleft, Segm. serrated finely cut in the middle, Leaves lanceolate and linear, Stem flexuose angular
3383 Cor. 4-cleft, Segm. finely cut, Leaves lanceolate acute, Stem erect rounded
3384 Leaves lanceolate, Flowers terminal corymbose, Capsules a little hairy

3385 A creeping plant with cordate obtuse stalked leaves

3386 Pubescent, Leaves reniform retuse and emarginate
3387 Leaves reniform emarginate pubescent beneath
3388 The only species

## 3389 A slender branched purple shrub

3390 Viscid, Scape and leaves roughish, Leaves rounded lobed toothed, Pet. lanc. Stam. much exserted 3391 Powdery, Scape and lvs. below smooth, Lvs. acutely lobed toothed, Pet. spatulate, Stam. scarcely exserted 3392 Very villous, Leaves acutely lobed, Pet. shorter than calyx, Stamens exserted
3393 Shrubby at base, Lvs. smooth above acutely lobed toothed, Cal. short villous, Pet. linear, Stam. exserted
3394. Leaves digittate, Leaflets sessile wedge-shaped truncate 3-toothed, Flowers racemose

3395 Leaves digittate, Leaflets 7-3-parted wedge-shaped acuminated serrated at end, Flowers spiked

## 3306 Leaves subulate, Pericarps not juicy

3397 Spreading hairy, Leaves subulate mucronate, Calyxes solitary, Appendages opened out colored 3398 Leaves subulate mucronate, Calyxes opened out
3399 Smooth, Branches ascending, Lvs. half round acute, Cal. in fruit keeled across the middle membranous
3400 Herbaceous, Leaves rounded smooth, Flowers clustered
3401 Erect spreading hairy, Leaves oblong half round obtuse, Flowers twin axillary
3402 Leaves rounded pubescent, Flowers axillary, Anthers colored
3403 Pubescent, Branches panicled, Leaves filiform with an axillary tuft, Floral very short, Cal. solitary
3404. Tomentose, Cal. with 5 angles and 5 awns, Leaves lancenlate flat

3405 Pubescent, Leaves linear flat, Cal. clustered woolly with a hooked dorsal spine
3406 Leaves broad lanceolate toothed, Cal. surrounded by a toothed crown, Seed round emarginate on one side 3407 Erect, Leaves filiform obtuse fleshy, Flowers axillary sessile 3 together, Style trifid

and Miscellaneous Particulars.
author of Hortus Wittebergensis, 1711-13. Very neat North American plants, requiring the culture of alpine plants.
607. Cussonia. In memory of Cusson, a celebrated botanist, who after laboring to complete the order off umbellate plants, had all his labor annihilated by his wife, who in his absence used the paper upon which his plants had been glued for household purposes. It is a genus of easy culture, and readily increased by cuttings planted in sand and placed under a hand-glass.
608. Anabasis. One of the names given by the Greeks to the Equisetum. A small plant, quite similar to some species of Chenopodium,
609. Salsola. From salsus, salt. From these plants, which are chiefly maritime, is obtained the kelp of our shores. This is a genus of plants producing the alkaline salts called barilla, soda, potash, and kelp. Most of them are herbaceous and annual, but some have shrubby stems.
S. kali, (Qaly or alqaly, Arabic. Bochart,) is found on the sandy shores of most parts of the world, and is very generally burned for soda for the glass manufacture.
S. soda is cultivated in Languedoc and also in Spain for making barilla; but is reckoned inferior to S. sativa, which grows on the Spanish shores of the Mediterranean, and affords all the best soda consumed in Europe. It is called by us Spanish or Alicant soda. In September, the crop is cut and laid in small heaps to dry. These heaps are then collected and burned, forty or fifty of them in a hole, in the ground.

Soda is in common use in the manufacture of glass and soap; with sulphuric acid, it forms Glauber's salts;
with marine acad, common salt; with the salt of Homberg, borax; and with cream of tartar, Rochelle salt.
610. Kochia. A genus divided from Salsola by Roth, and named by him after his friend Koch, a German botanist.

History, Use, Propagation, Culture,
611. Chenopodium. From $\chi^{3 \nu}$, a goose, and tous, foot; many species having large angular leaves extremely similar to the webbed feet of a water-fowl. This is a genus of succulent herbs, with their leaves for the most part covered with powdery granules; the whole plant of no beauty, but generally edible as a pot-herb.
C. Bonus Henricus is cultivated in some gardens as a perennial spinage, it being hardy and of early growth. The leaves are sometimes applied to wounds, and for cleansing old ulcers.
C. album is the most common of the species, and used to be boiled and eaten as greens; but C. maritimum is preferred to all the species for this purpose. The foreign species are of the easiest culture, and increased either by seeds or cuttings.
C. maritimum, where it abounds, is burned with Salsola kali and other marine plants, to produce soda.
612. Beta. From bett, red, in Celtic. B. vulgaris, Betterave, or beet-radish, Fr. ; Rothe Ruibe, Ger.; and Barba Brettola, Ital,, is a well known culinary root, used in salads either raw or boiled; forming a beautiful varnish; very much used as a pickle; preserved as a confiture; made? substitute for coffee; and yielding a

3408 Hoary, Leaves linear flat, Calyxes about 3 downy with opened obovate appendages
3409 Leaves linear somewhat fleshy pubescent, Flowers axillary about 3 together, Cal. with blunt appendages 3410 Herbaceous very hairy, Leaves linear fleshy, Dorsal spine of cal, straight
3411 All woolly, Leaves linear fleshy spreading, Cal in fruit stellate with 5 prickles hooked at end
3412 Branches diffuse, Leaves lanceolate silky, Calyxes not prickly
3413 Pubescent, Leaves linear lanceolate ciliated, Cal, in pairs, Appendages very short acute
81. Leaves flat angular.

3414 Leaves triangular hastate entire, Spikes compound clustered leafless axillary and terminal
3415 Leaves triangular toothed, Racemes clustered very upright close to the stem very long and leafless
3416 Leaves rhomboid-ovate and lanceolate: the lower sinuate toothed, Pan. axillary branched, Stem erect
3417 Leaves cordate triangular rather obtuse toothed, Racemes erect compound leafy shorter than the stem
£418 Leaves ovate unequally toothed acute, Racemes branched naked and simple stem erect
3419 Lvs. ov. uneq. tooth. acute shining, Race. corym. naked shorter than the leaf, Stem branched spreadin, 3420 Lvs, triangular ovate obsoletely toothed the younger powdery, Racemes clustered shorter than leafstalk
3421 Leaves triangular acute repand toothed, Racemes axillary erect nearly leafless, Bractes minute inflexed 3422 Leaves deltoid sinuate toothed rugose smooth uniform, Racemes terminal
3423 Leaves hastate sinuate eroded entire behind, Upper oblong entire, Seeds dotted
3424 Leaves rhomboid ovate croded entire behind, Upper oblong entire, Seeds smooth
3425 Leaves ovate-acuminate subcordate angular toothed, Racemes panicled naked terminal and axillary
3426 Leaves oblong sinuated, Racemes naked multifid, Upper bractes entire lanceolate
3427 Leaves ovate acute entire, Stem erect, Racemes cymose elongated nearly leafless
3428 Leaves oblong sinuated, Racemes naked many-cleft, Upper bractes S-lobed at end
3429 Ieaves pinnatifid, Segm. linear the lower toothed, Clusters of flowers axillary sessile
3430 Leaves lanceolate remotely toothed, Racemes leafy simple
3431 Leaves ovate lanceolate sparingly toothed, Spikes simple slender long leafless, Flowers trigynous
3432 Leaves oblong sinuate-toothed wedge-shaped at base, Clusters of flowers axillary
3433 Leaves oblong repand glaucous beneath, Spikes clustered simple naked axillary and terminal
3434 Leaves thick rhomboid-angular somewhat sinuated entire behind, Racemes erect compound leafy
§ 2. Leaves flat entire.
3435 Leaves rhomb-ovate, Flowers clustered axillary
3436 Leaves ovate, Stem decumbent, Cymes dichotomous leafless axillary
3437 Leaves ovate obtuse entire, Panicle terminal naked elongated, Stem simple erect
3438 Cauline leaves lanceolate obtuse, Branch-leaves oblong, Peduncles lateral solitary 1-flowered
3439 Leaves ovate lanceolate acute entire, Racemes axillary compound naked, Stem divaricating
3440 Leaves lanceolate fleshy entire, Corymbs dichotomous aristate axillary
3441 Leaves ovate sinuate, Racemes leafy simple
3442 Leaves wavy half-round, Flowers axillary sessile
8. Leaves rounded,

3443 Stems diffuse, Leaves oblong $\frac{1}{2}$ rounded, Flowers axillary clustered
3444 Erect shrubby, Leaves semicylindrical obtuse blunt
3445 Quite smooth, Branches panicled erect, Leaves filiform acutish, Flowers in threes stalked 3446 Herbaceous nearly erect, Leaves linear fleshy unarmed, Cal. succulent transparent
3447 Leaves rounded thick smooth terminated by a straight long bristle
3448 Flowers clustered, Lower leaves ovate, Root fleshy
3449 Flowers clustered, All the leaves linear-lanceolate, Branches divaricating
3450 Leaves with very thick ribs, Flowers three together, Root scarcely any
3451 Racemes erect panicled leafless, Flowers trigynous twin and solitary, Lvs, cordate acute unequal at base 3452 Flowers in pairs, Stem diffuse, The branches much interwoven, Root searcely any

3453 Leaves alternate stalked ovate acute with the veins and nerves purple

and Miscellanevus Particulars.
sugar equal to that of the cane. There are several varieties; those most esteemed for salads are the small red and Castelnaudary, and for extracting sugar, the green-topped. The seed is sown in March or April, on deep well comminuted soil. When the plants show two or three proper leaves they are thinned out, so as that each plant may occupy or be allowed a square foot of surface. By September or October the roots are fit for use, and may either be taken up as wanted, or taken up and buried in sand in the root-cellar.
B. Cicla, (Cicla is said by De Théis, to be a corruption of sicula, under which name it is spoken of by Catullus,) Bette, or Poirée à cardes, Fr. ; Mangold Kraut, Ger.; and Biettola, Ital., Is employed in horticulture as a spinage plant, and for being used as chard or asparagus; and in foreign agriculture for the production of sugar. It is much grown in the south of Germany and Switzerland, where the lamina of the leaves is used as spinage or put in soups, and the midrib is boiled and eaten with melted butter or gravy as chard. The culture is the same as for the red beet ; but, as the leaves are larger, the space allowed each plant is proportionally increased.
B. maritima is or may be used as a spinage plant or as greers.

History, Use, Propagation, Culture
plants. Another Bose (Caspar) was a professor of botany at Leipsig, where he published, ir 1728, a dissertation upon the motions of plants. Ripened cuttings root freely in sand under a hand-glass, witl out heat.
614. Herniaria. From hernia, a rupture, for which disorder it was formerly imagined to be a cure, but has long since been rejected even by the herbalists. H. fruticosa is well adapted for growing in pots or for rockwork, and is readily increased by seeds or cuttings; cuttings of the greenhouse species root freely under a hand-glass.
615. Ulmus. From Elm, its name in Anglo-Saxon, Teutonic, Gothic, and nearly all the dialects of Celtic. This is a genus of hardy trees, most of them valued for their timber. The species, like those of the genus Salix, are so nearly related as to be often confounded. Linnæus considered all the European elms as forming only one species. The U. campestris and glabra are those most generally cultivated in Europe. U. campestris grows also in Palestine, and Dr, Walker conjectures that it was originally brought from that country by the Crusaders. It is a tall elegant tree, but produces much less valuable timber than the U. glabra. U. suberosa, often called the Dutch elm, is frequently grafted on the U. glabra, as is also the U. campestris in the Scotch nurseries.
616. Planera. In honor of John James Planer, a German botanist, who published in 1788 an Index Plantarum Agri Erfordiensis, in one volume 8vo. A genus closely related to Ulmus, from which it is perhaps scarcely distinct.
617 Phyllis. From quidov, a leaf: the plant is remarkable for the beauty of its leaves. Phyllis, who was

3454 Smooth, Clusters many-flowered
3455 Hairy, Clusters few-flowered
3456 Leaves obovate acute hairy, Flowers clustered 4-cleft hispid, Stem shrubby
3457 Smooth, Stem erect dichotomous, Leaves ovate cuspidate, Flowers terminal and axillary
3458 Half shrubby, Leaves ovate oblong hoary, Calyxes hairy
3459 Clusters few-flowered hairy, Root thick woody
3460 Leaves doubly serrate unequal at base, Flowers subsessile clustered 5 -andr. Fruit smooth
3461 Lvs. doubly serr. nearly equal at base, F1. subsessile clustered 4-andr. Fruit smooth, Bark corky winged
3462 The branches only corky not the stem, Stature little more than that of a man, otherwise like the last
3463 Leaves doubly serrated smooth unequal at base, Flowers nearly sessile 5 -cleft, Fruit obovate naked
3464 Leaves doubly serrated unequal at base, Flowers 6-8-andr. stalked, Fruit fringed at edge [at edge
3465 Lvs. nearly doubly serr. uneq. at base, Axil. of veins ben. unit. by a membr. Fls. 5-8-andr. stalked, Fruit vil.
3466 Br . with cork. wing here and there on each side, Lvs. obl. ov. by deg, ac. nrly eq. at base, Fr. hairy closely frin.
3467 Leaves doubly serrated unequal at base acuminated pubescent beneath
3468 Leaves equally serrated equal at base
3469 Leaves irregularly doubly serrated equal at base with a long point rough above beneath soft downy
3470 Lvs, doubly ser, uneq, at base, Axil. of veins bearded beneath, Fl. clust. 5-andr. Fruit pubes, not fringed
3471 Decumbent, Branches smooth, Leaves very small equal at base
3472 Leaves small coriaceous shining shortly serrated ovate oblique at base

3473 Leaves subsessile oblong-cordate subcrenately coarsely toothed emarginate at base, Caps, short
3474 Leaves lanc. equally serrate equal at base shining, Flowers stalked tetrandrous, Fruit smooth

3475 The only species. Leaves lanceolate entire opp. 4 inches long, Corymbs axillary
3476 Fruit globose
3477 Fruit twin

3478 Seeds with a very long beak, Leaflets many-cut
3479 Seeds subulate hispid, Flowers radiant, Cauline leaves smooth
3480 Stem sicabrous, Leaves decompound smooth, Umbels fascicled with a single leaf

3481 Seeds ovate hispid, Cor. of one shape, Stem smooth
3482 Seeds cylindrical hispid, Stem hispid, Joints tumid

3483 Stem striated with tumid joints
3484 Seeds shining ovate subulate, Umbels lateral sessile
3485 Stem hairy decumbent, Leaves bipinnatifid, Umbel simple few-flowered

and Miscellaneous Particulars.
turned to a bare tree by the gods for having hung herself for tove of the absent Demophoon, became a tree covered with verdure upon receiving in that form the embraces of her lover returned.
618. Coriandrum. From zogis, a bug, in allusion to the smell of the leaves of the plant. C. sativum has been long cultivated, chiefly in Essex, and is considered as naturalized. The leaves are strongly scented; the seeds, which are slightly aromatic, are used to cover the taste of senna, and in spices as currie powder, and seasoning for black puddings : also, covered with sugar, as a sweetmeat; formerly they were steeped in wine or vinegar, and then dried, to render them milder.
619. Scandix. A name given by the Greeks to a plant used as an eatable, which appears to be that now called Scandix pecten. It is derived from $\sigma x E \omega$, to prick, on account of the sharp points of the seeds.
620. Anthriscus. The name of a plant resembling Scandix, described by Pliny. A. vulgaris bears a near resemblance to the common chervil (Chærophyllum sativum), and being gathered as such, and put into soups, by the Dutch soldiers who were in England in 1745, some of them were poisoned by it.
621. Cherophyllum. An ancient Greek name of the Chervil, derived from $\chi \alpha / \rho \omega$, to rejoice, and $\phi u \lambda \lambda o v$, leaf, that is to say a plant whose leaves have an agreeable smell. C. sylvestre has poisonous roots; though the leaves are occasionally used as a pot-herb, and are much liked by cows. The stems and leaves dye a beautiful green, and the umbels a yellow : the plant in a wild state is found only on fertile soils.
C. sativum is cultivated in gardens for the leaves, which are used in soups and salads. To have a successional supply, sow in February and August in shallow drills from six to mine inches apart.

History，Use，Propagation，Culture，
622．Eryngium．From the Greek verb equy\＆y，to belch．Dioscorides positively declares that the plant is a specific for all complaints arising from flatulence．These are singular plants，somewhat like thistles in general appearance ：they are generally of a bluish hue，prickly，and with large involucres，and dry coriaceous leaves．E．maritimum has long been in esteem as an aphrodisiac；the roots were formerly and are now，in some cases，kept in the shops candied，and formed in Shakspeare＇s time the kissing comfits of Falstaff．The Arabs regard the plant as an excellent restorative，and English grooms often mix the dried plant with the corn they give to stallions in the covering season．The virtue is said to reside chiefly in the roots ：the tops，Linnæus says，are eaten like asparagus in Sweden．
623．Sanicula．From sanare，to cure．This a vulnerary，to which marvellous virtues were formerly ascribed． S．europæa used to be considered a powerful vulnerary，but is now wholly rejected in medicine．Sir J．Smith says it partakes of that virose acrimony which is found in most umbelliferous plants growing in a moist fat soil．
64．Echinophora．From exvos，a hedgehog，and $\Phi \in \rho \omega$, to bear．In allusion to the strong rigid spines of the

3495 Leaves gladiate serrate spiny, Flowers undivided, Stem simple
3496 Leaves linear-lanceolate ensiform very long, Leaflets retlexed and paleæ trifid, Heads panicled
3497 Leaves all ovate cordate on very short stalks toothed, Stem virgate colored upwards
3498 Radical leaves oval flat crenate, Heads stalked
3499 Radical leaves oblong cut, Stem dichotomous, Heads sessile
3500 Radical leaves cordate : cauline palnate with the auricles reflexed, Paleæ tricuspidate
3501 Rad. lvs. obl. lanc. toothed spiny, Stem trichotomous, Lvs. of involucre entire larger than the heads spiny
3502 Radical leaves roundish plaited spiny, Heads stalked, Paleæ 3-toothed
3503 Radical leaves stem-clasping pinnate lanceolate
3504 Leaves sessile digitate spiny very small, Stem slender and weak dichotomous, Heads sessile
3505 Radical leaves trifid at the base somewhat pinnate
3506 Rad. lvs, cordate obl. obt. cren. lobed, Branches col. Lvs. of the involucrum very long stiff pungent entire
3507 Leaves palmate cut, Bractes stiff pinnatifid pungent, Stem thick
3508 Radical leaves cordate: cauline ternate cut, Involucres spiny pinnated ciliated
3599 Radical and cauline leaves alternate 3-parted twice trifid, Involucres subulate many-leaved spiny

3510 Lower leaves palmate, Lobes trifid cut-serrate, Florets all sessile
3511 Leaves all compound subternate, Leaflets ovate attenuate at base mucronate serrate, Florets all sessile
3512 Leaves all digitate, Leaffets oblong cut-serrate, Male flowers numerous stalked

3513 Leaflets subulate prickly entire
3514. Leaflets cut unarmed

## 3515 Seeds hispid, Stalks nerved beneath

3516 Fruit hispid with compressed bristles, Leaflets dilated rounded fleshy hairy, Umbels in fruit convex
3517 Seeds hispid, Central floret sterile fleshy, Common receptacle hemisphærical
3518 Leaves shining, Stem hairy, Leafstalks smooth, No sterile central floret
3519 Stem rough simple, Lvs. bipinn. Leaflets rather whorled many-cleft rigid, Bristles of fruit hairy purple
3520 Rays of the involucre flat, Segments recurved
3521 Fruit large very prickly
3522 Stem and lvs. bipin. vil. Leaf. ovate lobed toothed, Involucres very broad, Prickles of fruit dilated at base
3523 Involucres each 5 -leaved, One leaflet twice as large as the others
3524 Umbels trifid leafless, Umbellules 3-leaved 3-seeded
3525 Universal umbel trifid, partial 5 -seeded, Leaves pinnated serrated
3526 Universal umbel about 5-cleft, partial 3-seeded, Leaves supra-decompound, and decumbent stem villous
3527 Umbels spreading, Partial leaflets supra-decompound cut with linear segments, Fruit woolly
$\beta$ Fruit bristly
3528 Universal involucre about 3-leaved, Umbel trifid, Involucels 3-leaved
3529 Common involucre scarcely any, Umbel bifid, Involucres 5-leaved

and Miscellaneous Particulars.
involucrum, and indeed of the whole plant. Very much like an Ervngium, once said to bave been found in England.
625. Duvcus. From $\delta$ osso, to make hot; on account of its effects in medicine. D. Carota (from Kar, red, in Celtic), is well known for its esculent root. There are several varieties : the largest, and that best adapted for field culture, is called the Altrincham, from a village of that name in Cheshire. The early horn and orange are the best garden sorts. The seeds do not retain their vegetative powers more than a year, for which reason the cautious cultivator ought to prove them before sowing. The last week of March and first of April is the best season for sowing for a main crop. On farms where a deep sandy loam occurs, few crops of the root kind afford a more valuable return. In Norfolk and Suffolk they are a good deal in use as a field crop, and especially near Lowestoft in the latter county.
626. Caucalis. According to Linnæus, derived from zecs, to trail along; on account of the low habit of the plants. It is supposed that Pliny's Caucalis was the same as the Caucalis grandiflora of the present day.

History, Use, Propagation, Culture,
627. Torilis. A name contrived by Adanson and adopted by Gærtner, and other botanists. It probably, like many of Adanson's words, has no meaning.
628. Oliveria. Named in honor of G. A. Olivier, a French botanist, who travelled in the East. He published a splendid work on insects, by which he is better known than by his botanical merits.
629. Ledeburia. So named by Professor Link, after M. Ledebure, the author of a Catalogus Horti Dorpatensis, published in 1819 ; in which work this plant stands as Tragium tauricum.
630. Myrrhis. This plant has been long in cultivation. Formerly the young leaves were put into salads; and the roots were boiled and eaten cold, or in tarts, and in a variety of sauces, or candied. The seeds are put into soups in Germany, and in the north of England employed in polishing and perfuming oak floors and furniture.

6i1. Bunium. From Bryios, a hill, because the plant grows in dry and elevated situations. Terre Noix, Fr., Erdnuss, Ger., Castagno di terra, Ital. The roots of B. Bulbocastanum are or used to be dug up and eaten raw by the yoorer classes. They are farinaceous, sweet, and supposed to be very nourishing. Swine are very fond of them, and will soon become fat by feeding on them.
632. Enanthe. From oivr, a vine, and oy0os, a flower. The CEnanthe, says Pliny, smells like the vine in flower, and it is from that that it takes its name. This genus, like most of the aquatic umbellifera, is chiefly poisonous. CE. crocata is considered eminently so. The juice of the root or an infusion of the leaves is very efficacious in cutaneous diseases: in large doses it produces a fatal tetanus. The herb is applied in poultices to those ulcers that form in the cleft of the hoof of kine.

3530 Involucres many-leaved, Seeds ovate, Styles reflexed, Leaves decompound, Outer leaflet lin. lanceolate 3531 Universal involucre scarcely any, Seeds ov. Styles reflexed, Leaves decompound, Stem much branched
3532 Umbels simple subsessile, Leaves supra-decompound
3533 Leaves pinnate, Leaflets sessile 3-5-cleft, Segm. 3-fid ciliated, Flowers fascicled villous
3534 Radical leaves pinnate, Pinnæ ovate serrated cut, The upper 3-pinnatifid with linear 3-forked segments
3535 Villous, Leaves ternate decompound, Leaves ovate lanceolate pinnatifid, Central f. male
3536 Leaves uniform, Involucre many-leaved
3537 Seeds somewhat muricated, Peduncles furrowed, Leaflets channelled obtuse

3538 Stoloniferous, Cauline leaves with filiform fistulous pinnæ
3539 All the leaves many cut obtuse nearly equal
3540 Outside stalks of the umbels longest branched male
3541 Leaves bipinnate, Fruit globose
3542 Leaves bi-tripinnate; the upper pinnate, Leaflets wedge-shaped cut serrate striated
3543 Cauline leaves pinnate; radical bipinnate, Leaflets linear
3544 Radical leaves caudate split: cauline entire very long simple
3545 Lower pinnæ of the leaves ovate; upper linear, Stalks angular
3546 Leaflets lanceolate ficshy
3547 Leaflets wedge-shaped split (Tenoria, Spr.)
3548 Leaves bipinnate flat, Umbel hemispherical, Seeds hairy
3549 Leaves pinnate decussate cut angular, Seeds naked
3550 Leaves pinnate cut angular
3551 Leaves subpinnate, Leaflets imbricated downwards, Umbel lens-shaped
3552 Pubes, hoary, Lvs, supra-decompound, Leafiets wedge-shaped 4-toothed, Umbel with many rays globose
3553 Leaflets divaricating, Leaves thrice pinnate
3554 Lower leaves shining, First umbels subsessile, Seeds hairy
3555 Leaves capillary, Styles persistent erect, Seeds oblong hairy
3556 Leaflets linear flat hairy, Petals divided, Seeds oblong hairy
$\beta$ Leaves many-parted, Segm. linear rounded acuminated
3557 Stem furrowed smooth, Leaves pinnated smooth : radical roundish finely toothed; cauline Iinear
3558 Stem furrowed pubescent, Leaves pinnate pubescent: radical cordate cut obtuse toothed; cauline linear
3559 Leaves all alike pinnate, Leaflets lobed, the ord one 3-lobed
3560 . Leaves pinnate, Pinnz many-parted, Segments falcate acute
3561 Radical leaves pinnate crenate; upper wedge-shaped cut, Umbels nodding
3562 Radical leaves trifid cut
3563 Peduncles opp. the leaves, Flower leaves bifid or trifid, Leaf-stalks winged membranous

and Miscellaneous Particulars.
633. Crithmum. From $\pi \operatorname{sig} \eta_{n}$, barley. Its seed is very similar to a grain of barley. Saint Pierre, Fr., Meerfenchel, Ger., and Finochio marino, Ital. The C. maritimum is found on stone walls, as well as by the sea shore. The inhabitants, where it abounds, not only use it as a pickle, but as an ingredient in salads, and as a pot-herb. In the garden it may be grown on beds of sand and rubbish, or in pots. Braddick, an ingenicus horticulturist, cultivated it at Thames Ditton, in a sheltered dry situation screened from the morning sun: he protected it by litter during winter, and in spring sprinkled the soil with a little powdered barilla. "This I do," says he, "to furnish the plant with a supply of soda, since in its native place of growth it possesses the power of decomposing sea water, from which it takes the fossil alkali, and rejects the muriatic acid." With this treatment it flourished abundantly, producing an ample supply of leaves and shoots, which were cut twice in the season. (Hort. Trans. ii. 232.)
634. Aikamanta. A plant found upon Mount Athamas in Thessaly, as some say; others, however, believe it to have been named after King Athamas, a king of Thebes, who first brought it into use.
635. Pimpinella. According to Linnæus, this name has been altered from bipennuia, twice pinnate, in allusion to the leaves. P. saxifraga differs surprisingly in size and foliage in different situations, insomincis that some make several species, as P. minor, major, and dissecta. The root is acrid, and used as a masticatory in tooth-ache, also externally to take away freckles, and in gargles to dissolve viscid mucus.
P. anisum (anysun, Arabic ; Golius.) is cultivated in Malta and Spain, whence the seeds are annually imported into England for their use in medicine. They are aromatic and carminative, and yield an oil both by distillation and expression, which is much used in flatulencies, as are the seeds in substance. The oil is also

History, Use, Propagation, Culture,
used by vermin-killers to scent poisonous baits, or to neutralize or obliterate other smells. Anise is sometimes sown in gardens for the leaves, to be used as a garnish, or for seasoning, like fennel.
636. Phellandrium. A name under which Pliny describes an umbelliferous plant, of similar nature to the one now so called. In running streams the leaves of this plant become divided, like those of Ranunculus aquatilis in the same situation. When the plant grows in an angle, out of the rapid course of the stream, it produces its flowers; but it flowers best on the muddy banks of ditches and ponds. According to Linnæus it renders horses paralytic, the disease being brought on by a Coleopterous insect, the Curculio paraplecticus, which breeds in the stalks, and is cured by pigs' dung The seeds are sometimes used in agues.
637. Dondia. A curious little plant resembling Astrantia, and named from Dondie Duprée, a French botanist.
638. Trachyspermum. From $\tau \propto \chi \nu$, rough, and $\sigma \pi \in g \mu \eta$, seed; on account of the roughness of the seeds. Nearly related to Ammi, with which it agrees in habit
639. Ammi. From oureos, sand; because it grows in sandy places. Plants with a delicate babit, very finely cut leaves, and white flowers.
640. Bubon. Bubonion is a name of Pliny's, now applied to this plant; as Pliny's was used in medicine, so is this, and there the resemblance ceases. B. macedonicum is put among clothes to scent them, in some parts of the East. From B. Galbanum (derivation obscure) the drug of that name is obtained, though it is not clear that it may not also be got from other species. It is collected from the spontaneous exudation of the

3598 Leaves pinnate : floral ternate

and Miscellaneous Particulars.
stem, or by an incision in the stalk a little above the root, from which it immediately flows, and soon becomes sufficiently concreted for gathering. Medicinally considered, this gum-resin is said to hold a middle place between Asafœetida and Ammoniacum; but it is far less fœetid than the former.
641. Cuminum. From the Arabic name of the plant qamozn. (Golius.) This is a dwarf fennel-looking plant, cultivated in the south of Europe and lesser Asia for its seeds, which are hot and aromatic, and used like those of Anise, Caraway, \&c.
642. Seseli. Golius (p.167.) says, a plant related to this is called Seycêlyous in Arabic. There is also a

Greek $\sigma \in \sigma^{2} \lambda$.
643. Thapsia. The Thapsia, says Dioscorides, derives its name from the isle Thapsus, where it was first discovered. Plants resembling Smyrnium in habit
644. Actinotus. From \&x $\neq$, a ray, in allusion to the ray-like appearance or the involucrima. Curious New Holland plants with the habit of Astrantia.
645. Trinia. Named by Hoftmann after Dr. Trinius, a celebrated Russian botanist, who has published some works upon grasses. Plants resembling Pimpinella in appearance.
646. Sium. Siw signifies water in Celtic. This is a genus of aquatic plants. S. nodifiorum bears a good deal of resemblance to the water-cress (Nasturtium officinale), and, unless when in flower, is not very easily distinguished from it by the inexperienced. It is commonly considered poisonous, though, according to Dr.

History, Use, Propagation, Culture,
Withering, the juice, in doses of from two to four ounces, either alone or with milk, every morning, is an excel lent alterative in cutaneous diseases.
S. sisarum (from Dgizer, its Arabic name, in which language it signifies carrot), Chervis, Fr., Zuckerwürtzel, Ger, and Sisaro, ItaL., is cultivated for its roots or tubers, which, boiled and eaten with butter, are sweet and agreeable. A crop may either be raised from seed or offsets; if from the former, sow in March or the beginning of April, and when the plants come up, whether in rows or broadcast, thin them, so as nine or ten square inches may be allowed to each plant. With the usual summer culture the roots will have attained their full size in September, and may be taken up as wanted for use. In growing from offets, allow about the same distance planting about the end of April, and giving the usual culture afterwards.
647. Sison. From the Celtic sizun, which signifies a running stream. Many of the plants grow in such situations. This genus is called Honewort, from its being used formerly to cure a swelling in the cheek called the Hone.
648. Cicuta. A word used by Virgil (Ecl. 2 and 5.), but of unknown meaning. C. Firosia is poisonous to mankind and kine, but not to horses, sheep, or goats; the smell being weak in the spring, cows are apt to be killed by it, but afterwards the odour enables them to avoid it. C. maculata is used in medicine like Conium maculatum.
649. Conium. Said by Linnæus to be derived from zovs, powder, dust; but the application of the term is not evident. C. maculatum is a well known poisonous plant, lately admitted into the Materia Medica. According to Linnæus, sheep eat the leaves, but horses, cows, and goats refuse them. Ray informs us, that the thrush will feed upon the seeds, even when corn is to be had. Curtis says hemlock is eaten by few or no insects. The dried fistulous stalks of this and several other umbelliferous plants are called by the country people kecksies. As a medicine, hemlock seems to act on the constitution in a great measure like opium.
 Fr., Smyrnerhraut, Ger., and Macerone, Ital. S. perfoliatum and olusatrum are or may be cultivated as Asparaginous and salad plants, though they are now almost entirely supplanted by the celery, which they somewhat resemble in flavour. The seeds are sown in March in rows two feet apart, and afterwards thinned out to six inches. As the plants advance, they are earthed up like celery, and, like it, are ready for use during autumn and winter. Olusatrum is from olus, pot-herb, and atrum, black, from the dark colour of its foliage. Our English name, Alexanders, is certainly a mere corruption of Olusatrum.
651. Apium. From apon, water, in Co'tic ; from the place where the plant ${ }^{7}$ grows. A. Petroselinum, ( $\pi \varepsilon \sigma c^{\prime} e_{,}$ stone, and selinum - Stone Selinum) Persil, Fr., Petersilie, Ger., and Petroselina, Ital., is a well known seasoning herb, and it is also sown among pasture grasses as likely to counteract the liver rot in sheep. There is a variety called the Hamburgh or large rooted parsley, which is cultivated for its roots, which, as well as the

and Miscellaneous Particulars.
roots of the other varieties, communicate an agreeable flavor to soups and stews. The curled thick-leaved variety is that most esteemed for soups and as a garnish : it is sown in drills, and should be thinned out when it is so far advanced as to shew the finer curls of the leaves. It is too commonly left to grow as it came up which makes it but a very inferior article for garnishes. The Hamburgh sort should be thinned so as each plant may occupy ten or twelve square inches of surface.
A. graveolens is one of our most valuable salad plants, and is a remarkable instance of the effect of cultiva. tion, being in its wild state, rank, coarse, and unfit to eat; and blanched in the garden, sweet, crisp, juicy, and of a most agreeable flavor. The green leaves are used in soups, and in Italy and the Levant, where the plant is grown, but not blanched, this is its principal application. Here both the leaves and seeds are used in soups and stews, and the blanched stalks in that way and also as a salad, either alone or in composition. One variety, the Celeriac, is grown entirely for the root or base of the leaves, which assumes a bulbous form, is solid and white, and used either in soups or as a salad.

In order to produce excellent celery, a deep rich light soil is required, and especially a soil on a dry bottom. The seed in the main crop is commonly sown in the beginning of April on a bed for transplantation ; the plants so raised are commonly pricked out into other beds, and placed four or six inches asunder. At eight or twelve inches height the plants so brought forward are transplanted into trenches for blanching. These trenches are small open ditches of from six inches to a foot deep, and they are dug from two and a half to three feet apart from each other, in order to admit of earthing up the plants to the height of two feet or more above the natural surface. The excavated earth is laid in the intervals, and some dung is dug into the bottom of the trenches. Along these the plants are inserted at four or five inches apart, and as they grow, the earth from the sides of the trenches and from the wide intervals between them is applied to the plants in small layers at a time, till at the end of the autumn the ditches have become banks two or three feet high. The celery is now fit to use, and by earlier and later crops this salad is had in perfection from August or September till May following. Celery is grown to great perfection in Lancashire, where blanched stalks have been dug up four feet six inches long, and weighing nine or more pounds, of the best quality. A variety of modes of cultivating the celery are brought together in the Encyclopadia of Gardening, which well deserve the perusal of those who aim at growing this root in the best manner.
652. Fgopodium. From eis aryos, a goat, and $\pi 85$, a foot. Each of the parts of the leaf is split so as to resemble the cloven foot of a goat. The leaves of E. Podagraria smell like those of Angelica, and may be eaten in spring salads.
 hairs.

History, Use, Propagation, Culture,
654. Anethum. From as(is, to burn, the plant being very heating. Large quantities of the seeds are yearly imported into this country from the south of France. They are used in medicine as carminatives, and, as it is said, in the manufacture of the British gin. No one has succeeded in growing the plant for a crop in this country.
655. Carum. A native of Caria, according to Pliny, b. xix. c. 8. Carvi, Fr., Kümmel, Ger., and Carvi, Ital.

U-C. Carti is cultivated both in agriculture and horticulture: in the former for its seeds, which are used to flavor cakes, to form sugar plums, to flavor spirits, and form a carminative distilled water. In the culinary art the leaves are sometimes used as an ingredient in salads, or as a pot herb, like parsley; and the roots are said to be superior in flavor to those of the parsnip.
656. Cnidium. The ancient name of an herb, supposed to have been an Orach, and certainly having no affinity to the plants now called Cnidium.
657. Bupleurum. From $\beta_{8} 5$, an ox, and $\pi \lambda \varepsilon v \rho o y$, a rib. How applied is not apparent. These are plants remarkable among the Umbelliferous tribes for having simple leaves,

3623 Frut compressed

3665 The only species
3666 Leaves all of one shape
3667 Leaflets very fine whorled, Stem very leafy, Comm. invol, many-leaved

and Miscellaneous Particulars.
658. Hydrocotyle. From $\dot{\chi} \delta \omega \rho$, water, and $₹ \circ \tau v \lambda \varkappa$, vessel ; its leaf is round and a little depressed in the centre, so as to hold a drop of water. This is a genus of aquatics and marsh plants of no great beauty, their flowers being obscure and of dull colors. H. vulgaris, the Wassernabel of the Germans, has been supposed to communicate the liver rot to sheep. This is a vulgar error, arising from the circumstance of the fluke or flounder insect (Fasciola hepatica) being found in marshes where this plant, and also the Drosera and Pinguicula, abound, as well as in sheep's livers. It is a known fact, however, that sheep never feed on any of these
plants.
659. Spananthe. From oxoyos, rare, and ay, os, a flower, in allusion to the small number of flowers in the umbel.
660. Ulospermum, From ऊ̌vios, curled, and arȩ $\mu x$, seed, on account of the membranous curled ribs of the seed. A plant referred to Conium by Desfontaines, and to Cachrys by Sprengel, but very distinct from both.
661. Fthusa From $\alpha, 9 \omega$, to burn, on account of its dangerous acridity. \&. Cynapium (xevos $\propto \pi i o v$, dog. parsley) is a common weed in gardens, and sometimes mistaken for parsley; from which, however, it is easily

History, Use, Propagation, Culture,
distinguished by being of a darker green, a different shape, flat, and not curled, and of a disagreeable smell. When eaten in mistake for parsley it occasions vomiting, which may be stopped by a very large dose of brandy. It is deleterious to geese.
662. Imperatoria. A metaphorical name given to this plant to express its many virtues. For the same infusion of it in wine instead of bark in quartan agues
663. Selinum. From $\sigma \varepsilon \lambda$ nyn, a name of the moon, in allusion to the crescent-like form of the seeds when cut across. The Greeks seem to have used the word selinon, with reference to the same plants as we call umbelliferous.
664. Angelica. So called, in allusion to its agreeable smell and medicinal qualities. A. archangelica (from on superior, an augmentative prefix), is sometimes cultivated in gardens for its leaf-stalks, to be blanched and eaten as celery, or candied with sugar. It is considered stimulant and anti-pestilential.
665. Ligusticum. This plant, says Dioscorides, grows in great abundance in Liguria, near Mount Appennine, from which circumstance it derives its name. $L_{\text {. levisticum }}$ and scoticum are sometimes used as potherbs or ingredients in salads, and are accounted emmenagogue. The root is carminative; and an infusion of the leaves is used as a purgative to calves in the Isle of Sky.
666. Hasselquistia. So named by Linnæus, in memory of his pupil, Frederick Hasselquist, M. D., who

## 3668 The only species

3669 Stem striated, Root fusiform divided, Rays of umbel hispid
3670 Leaves 3-parted thrice sinuated. A doubtful species, scarcely distinct from the next
3671 Stem furrowed, Common involucre many-leaved, Leaflets wedge-shaped cut
3672 Stem furrowed with acute angles, Comm. invol. O, Leaflets lanceolate cut at the end with a callous point 3673 Stem rounded striated, Comm. invol. O, Sheaths of leaves loose, Leaflets filiform linear
3674 Stem rounded striated, Comm. invol. O, Leaflets trifid linear mucronate
3675 Stem striated, Lvs. pinnat. subcor. Leaflets ov.-obl. at base cartil. serrace, Uoper sheaths enlarged leafless
3676 Stem woody naked beneath, Lower leaves bipinnate, Pinnæ lanceolate entire and cut serrate
3677 Leaves doubly pinnate ovate lanc. serrated with the odd leaflet lobed
3678 Leafiets equal ovate lanceolate serrated
3679 Leaflets lanceolate serrated decurrent
3680 Leaves very much divaricating, Leaflets ovate serrate, Stem with the peduncles whorled
3681 Outer pair of leaflets united together; terminal leaflet stalked
3682 Leaflets equal ovate cut serrate
3683 Leaves multiple, Leaflets cut upwards
3684 Leaves biternate
3685 Leaves many times pinnate, Leaflets pinnately cut
3686 Leaves bipinnate, Leaflets confluent cut entire
3687 Leaves decompound cut: cauline ternate lanceolate entire, Furrows of seed obsolete
$\$ 688$ Lvs. supra-decompound, Leaflets pinnatifid, Seg. linear mucronate, Comm. invol. scarcely any deciduous 3639 Lus. supra-decorn. 3691 Leaves pinnate, Lower leaflets acute with a smaller one
3692 Leaves biternate; radical decompound, Leaflets lin. lanc. entire

## 3693 Leaves pinnate, Leafets pinnatifid

3694 Leaves cordate

## 3695 Seeds scaly

3696 Leaflets linear very long simble
3697 Leaflets linear subulate rounaed, Comm, invol, O
3698 Leaves supra-decompound, Leaflets lanc. linear flat
3699 Leaves cut, Segm. 3-toothed unequal shining
3700 Pinnæ of leaves naked at base, leaflets setaceous
3701 Leaflets with appendages, Umbels nearly sessile
3702 Leaves supra-decompound many cut acute decurrent, First umbel sessile
5703 Leaves obliquely cordate toothed, Teeth mucronate, Wings of seeds crisp 3704 Leaflets 3-lobed cut
3705 Leaves obtuse ovate at base lobed
3706 Leaflets wedge-shaped trifid, Segm. oblong bluntish with a callous point at end
3707 Stem naked 3-cornered, Branches angular, Leaflets obl. toothed crenate, Involucres many-leaved short 3708 Leaflets lanceolate obtuse mucronate entire sessile
3709 Leaves lanceolate entire : the outer joined together

and Miscellaneous Particulars.
travelled into the Holy Land, \&c. and died at Smyrna in 1752. Author of Travels in Palestine. A remarkable genus, supposed with some reason to be a monstrous alteration of a species of Tordylium.
667. Artedia. So named by Linnæus, in honor of Peter Artedi, a Swedish naturalist, one of the first who attempted to divide umbelliferous plants into genera. His method was followed by Linnæus, and was, perhaps, not more defective than many of those which have been proposed in modern days. He died in 1735 .
668. Ferula. From ferire, to strike. The stalks were used as a rod for children, because they made more noise than harm. F. communis is one of the tallest of herbaceous plants. The flower-stalk soon becomes dry after the seeds ripen, and then the Sicilians take out the pith and use it for tinder. It is very abundant in Apulia, where it is eaten by buffaloes. Gerarde says, it grew to the height of fifteen feet in his garden in Holborn. The drug asafotida is obtained from one or more species of this genus natives of Persia; and one species, the F. asafætida, though introduced to our gardens in 1782, is now lost. The drug is the inspissated juice of the root, which being bared of earth and cut across at the top, it oozes out, and when dry, is seraped off as opium is from the capsule of the poppy. The plant grows three feet high, with yellow flowers and hemlocklike leaves and habit.
669. Laserpitium. The Latin name of the Silphion of the Greeks. D'Herbelot says, that the natives of Africa called the plant silphi or serpi, whence the Latins formed lac serpitium and Laserpitium. (Bibl. Or.
p. 490 .

History, Use, Propagation, Culture,
670. Peucedanum. From rєv», a pine-tree, and $\delta \propto \nu$, dwarf; a diminutive fir. The plant was so called on account of its strong smell, which resembles resin.
671. Pastinaca. One of the names given by the Latins to the Drucus of the Greeks. It is derived from pastus, nourishment. $P$. sativa is a well known culinary root, and grown also in agriculture for feeding cattle. It was much in use during Catholic times to eat with salted fish. In the north of Ireland a sort of beer is brewed from the roots mixed with hops; a very good wine is also made from them; and by distillation they yield an ardent spirit, similar to that afforded by the potatoe. The parsnep is much cultivated in Jersey and Guernscy, chiefly for feeding milch cows. The variety preferred is called the Coquaine, the roots of which, Dr. Macculloch informs us (Caled. Hort. Mem. i. 408.), sometimes run four feet deep, and are rarely so small in circumference as six inches. The time of sowing is February and March, in drills to admit of stirring the soil between the rows. They should be thinned so as that each plant may have a surface of twelve or fourteen square inches, and, with the usual routine culture, the crop will be mature in October. They may be taken up and housed like the carrot, or as wanted for use: as they are not easily injured by frost, the latter mode is the best, where they are grown only for the table.
P. opopanax (oros, juice, zoy, all, and $\alpha \approx 05$, cure: a cure for all complaints) produces from its stem, when it is cut, a gum resin which is a famous cure in the East for all sorts of maladies.
672. Heracleum. Named after the hero Hercules, who, according to a modern French author, was not only a warrior but a great doctor and botanist. H. Sphondylium (from $\sigma \phi \sigma \nu \delta u \lambda 05$, a vertebra, in allusion to the jointed stem), the Heilkraut of the Germans, is common in most parts of Europe. The seeds smell somewhat

3710 Leaves pinnatiff, Segm, lanceolate, Common involucre scarcely any, Stem smooth
3711 Leaflets linear-lanceolate veiny striated distinct
3712 Leafets oval-lanceolate entire stalked
3713 Leaves supra-decompound linear-subulate smooth, Comm. invol. pinnated
3714 Leaflets linear
3715 Hairy, Stem rounded simple, Lvs, tern. bipinnate, Leaflets alternate ovate pinnatifid cut wedge-shaped
3716 Leaves supra-decompound hairy, Leaflets many cut, Leaves of many-leaved invol, membranous at edge
3717 Leaves 5 times 3-parted filiform linear
3718 Leaves ternate decompound, Leaflets linear obtuse stiffish, Comm. invol. scarcely any
3719 Leaves 3-parted filiform longer, Umbels deformed
3720 Leaflets linear branched
3721 Leaflets linear acute, First umbels sessile
3722 Leaves thrice pinnate, Caukine leaflets linear lanceolate : radical oblong many-cut
3723 Leaves simple cordate lobed shining acutely crenate
3724 Leaves simply pinnate
3725 Leaves pinnate, Leaffets with their front base cut out
3726 Stem rounded rough branched, Leaves bipinnatifid, Peduncles rigid villous
3727 Leaves pinnate, Leaflets 5 oblong pinnatifid acute toothed, Cor, of one shane
3728 Leaves pinnate, Leaflets 5 oblong pinnatifid acuminate toothed rough at edge, Flowers radiant
3729 Leaves cruciate pinnate, Leaflets linear, Corollas flosculous
3730 Leaflets pinnatitid crosswise toothed
3731 Leaves pinnated, Leaflets 5 : the intermediate sessile, Cor. of one form
3732 Leaves pinnated, Leaflets 5: the intermediate sessile, Flowers radiant
3733 Leaves pinnated rugose on each side scabrous, Flowers somewhat radiant
3734 Leaves simple cordate obsoletely lobed serrated
3735 Leaves simple 3-leaved cordate toothed beneath pubescent
3736 Leaves simple and ternate many cut torn, Segments linear
3737 Involucres longer than the umbels
8738 Partial involucres the length of flowers, Leaflets ovate laciniate
3739 Seeds furrowed wrinkled plaited, Universal involucre 1-leaved trifid
3740 Umbellules remote, Leaves pinnated with roundish cut pinnz
3741 Umbels clustered radiant, Leaflets lanceolate cut serrated
3742 Umbels clustered radiant, Leafiets angular toothed pubescent
3743 Radical lvs, palmate 3-lobed unequally twice serrated; cauline sessile lobed, Involucre longer than umbel 3744 Radical leaves 5-lobed, Lobes trifid acute toothed, Involucres lin. lanceolate entire
3745 Radical leaves digitate, Leaflets about 7 lanceolate asute deeply toothed
3746 Radical leaves 5 -lobed, Lobes oblong acutish trifid mucronate-toothed, Involucres entire

## 3747 Hoary, Leaves decompound, Leaflets wedge-shaped trifid, Flowers angular, Fruit villous

$\$ 748$ Stem dichotomous knotty, Leaves decompound, Involucre short, Female flowers with a long ray 3749 Stems decumbent, Sheaths loose, Seeds smooth

and Miscellaneous Particulars.
like a bug. Gmelin informs us, that the inhabitants of Kamtchatka, about the beginning of July, collect the footstalks of the radical leaves, and after peeling off the rind, which is very acrid, dry them separately in the sun, and then tying them in bundles, lay them up carefully in the shade in bags; in this state they are covered with a yellow saccharine efflorescence, tasting like liquorice; this being shaken off, is caten as a great delicacy. From the stalks thus prepared and fermented with bilberries the Russians distil an ardent spirit, which, Gmelin says, is more agreeable to the taste than spirits made from corn. A kind of ale is brewed from the leaves and seeds in Poland and Lithuania, and attempts have been made to extract sugar from this plant, but forty pounds of the dried stalks only yielded a quarter of a pound of powdery sugar, The young shoots may be eaten as asparagus. Rabbits and swine are fond of the leaves, but not horses. H. sibiricum is used in the same manner in the north of Siberia and Kamtchatka.
613. Tordylium. Bodæus à Stapel thinks that the derivation of the name is to be found in rogyus, a latke, and id $\lambda$, to turn, because the seeds seem as if tumed in a lathe. But this seems to be a commentator's guess only.
 positon of the involucrum of all the species, and of A. minor in particular.
675. Zosima. Named by Hoffmann, in honor of the three famous brothers Zosimades, the celebrated patrons of so many fine editions of the Greek classics. A remarkable plant, formerly referred to Heracleum, native of most of the eastern parts of the world.
676. Rumia. Named by Hoffman after Rumia or Rumina, the goddess who presided over suckling, on

History, Use, Propagation, Culture,
which account all vascular substances, with firm outside but very cellular structure inside, were said to be Ruminosa. The seeds of this genus are of that nature. There was also a Dr. Rumy, professor of agriculture in some Polish university.
677. Cachrys. One of the names given by the Romans to the Rosemary. According to Morison, the name was derived from zouw, to grow hot, on account of the carminative qualities of the plant. The Cossacks of the Jaik chew the seeds of C. odontalgica for pain in the teeth, and obtain relief by the copious salivation which follows their use. This genus is well known by its corky large smooth seeds.
678. Hippomarathrum. From ixжos $\mu \propto \rho \alpha \cdot \rho \circ y$, horse-fennel, on account of its size compared with that of common fennel.
679. Viburnum. This name is derived, according to the account of Sebastian Vaillant, from the Latin word viere, to tie, on account of the pliability of the branches of some species. V. tinus ( $\tau$ yov, small, dwarf, tiny) is one of the most ornamental of evergreen shrubs, with shining leaves and shewy white flowers, which appear during the winter months. V. lucidum and strictum are taller and more tender than the common species, of which they are by many considered as only varieties.
V. lantana (from lento, to tie) grows chiefly on calcareous soils : it has pliant mealy twigs, and the bark affords a bird lime.
V. opulus, (alteration of populus) var roseum, is a most ornamental shrub, producing large white bunches of

3750 Leaves bipinnate, Pinnr opposite linear rather pungent, Seeds furrowed smooth

3784 Leaflets ovate oblong obtuse mucronate scabr, above villous beneath, The last joints of stalk membranous 3785 Leaflets lanceolate acuminate finelv serrated hairy beneath

and Miscellancous Particutars.
white flowers, resembling those of Hydrangea, and like them abortive. With lilac, laburnum, and scarlet thorn it forms an elegant group.
680. Sambucus. A musical instrument called by the Latins sambuca, is supposed to have been made of the wood of this tree, on account of its hardness. The tree was always famous for this quality; so that Pliny says it consists of nothing but skin and bones, (b. xvi. c. 39.) S. ebulus is supposed to prevent diseases in swine if used as litter: the root is violently cathartic, the leaves drive away mice, and the berries dye blue.
S. nigra with its varieties, and S. racemosa, are very shewy trees in shrubberies when in flower and fruit. S. nigra is narcotic, purgative, and acrid; the flowers in decoction are diaphoretic and expectorant; used to flavor vinegar, and deleterious to turkeys. The French put layers of them in heaps or casks of apples, to which they communicate a most agreeable odor. The berries are poisonous to poultry; but make a powerful wine much in esteem among country people. As the common elder will grow either exposed to the sea breeze or on high mountains, it is recommended as a nurse-plant in forming plantations. To thrive and be productive as a fruit tree however, it requires a deep, rather moist, and rich soil.
681. Rhus. Derived from the same root as Rosa, rhudd, in Celtic, signifying red, on account of the color of the fruit. Pys, in Greek. Sumach, its English name, is an alteration of simdeq, its name in Arabic. (Forsk.) In some of the species of this genus the flowers are hermaphrodite; in others, as $\mathbf{R}$. elegans, pentaphyllum, and Toxicodendron, the male and female are on separate plants. In R. toxicodendron, they

History, Usc, Propagation, Culture,
are polygamous males, being mixed with the hermaphrodites. The species from the Cape of Good Hope rarely flower in this country, and are chiefly cultivated for the sake of their foliage, which is neat and not susceptible of injury from bad management.
R. Coriaria is used instead of oak bark for tanning leather, and it is said that that of Turkey is chiefly tanned with this plant. The seeds are in common use at Aleppo at meals to provoke an appetite. Both leaves and seeds are used in medicine as astringent and styptic.
R. javanica in China affords an oil by bruising the berries and boiling them in water: they use it as a varnish, but it does not keep its polish so well as the oil of R. vernix.
R. glabra has berries which dye red, and the branches boiled with the berries afford a black ink-like tincture. This plant is like a weed in some parts of North America, where it overruns land left for a few years in pasture.
R. vernix affords the true Japan varnish, which oozes out of the tree on its being wounded, and grows thick and black when exposed to the air. It is so transparent, that when laid pure and unmixed upon boxes or furniture, every vein of the wood may be clearly seen. With it the Japanese varnish over the posts of their doors and windows, their drawers, chests, boxes, scymitars, fans, tea-cups, soup-dishes, and most articles of household furniture made of wood. The milky juice of the plant stains linen a dark brown. The whole shrub is in a high degree poisonous; and the poison is communicated by touching or smelling any part of it. In forty-eight hours inflammation appears on the skin, in large blotches, principally on the extremities, and on the glandular parts of the body: soon after small pustules rise in the inflamed parts, and fill with watery matter, attended with burning and itching. In two or three days the eruptions suppurate; after which the inflammation subsides, and the ulcers heal in a short time. It operates, however, somewhat differently upon

3786 Leaflets ovate acuminate serrate beneath downy
3787 Leaflets lanceolate acuminate with close serratures smooth on both sides whitish beneath
3788 Leaflets lanceolate acuminate in the middle distantly serrated smooth on both sides, Flowers diœecious
3789 Smoothish, Leafets lanceolate oblong serrated downy beneath, Racemes erect green
3790 Dwarf, Branches and leaf-stalks pubescent, Leaflets oval, Fruit very downy
3791 Leaflets entire annual opaque, Leaf-stalk entire equal
5792 Leaflets entire perennial shining, Leaf-stalk entire equal
3793 Leaves very large coarse rugose and downy
3794 Leaves pinnated in 9 pair rugose smooth above
3795 Leaflets obcordate, some of them very glaucous
3796 Stem shrubby unarmed, Leaves ternate hoary cuneate ovatc, the middle one longest
3797 Prickly, Leaves ternate smooth, Leaflets narrow wedge-shaped at the end 3-lobed and entire
3798 Spiny, Leaflets wedge-shaped toothed beyond the middle, above shining with prominent nerves
3799 Leaflets unequally serrated, Outer petioles with membranous joints
3800 Leaflets entire, Leaf-stalk membranous jointed
3801 stem rooting
$\propto$ Leaves large entire or rarely tonthed, Creeping
$\beta$ Dwarf, Leaves variously sinuated downy about flowering time, Erect
$\gamma$ Leadets oblong oval with a long point, Fruit very small
3802 Leaflets sessile ovate rhomb-shaped cut serrate hairy
3803 Leaflets lanceolate entire sessile smooth on each side ciliated, Common stalk pubescent, Branches pend,
3804 Leaflets obovate mucronate toothed smooth, Stem scabrous
5805 Leaflets sessile wedge-shaped very smooth 7-toothed, Teeth mucronate
3806 Leaflets scssile wedge-shaped cut pinnatifid beneath downy and veiny
3807 Leaflets stalked rhomb-shaped angular downy beneath
3808 Leaflets obovate entire sessile hairy on both sides
3809 Leaflets obovate mucronate smooth, Branches villous
3810 Leaflets linear lanceolate entire smooth narrowed at base : the intermediate one stalked
3811 Leaflets stalked linear lanceolate entire downy beneath
3812 Leaflets sessile linear revolute rusty beneath
3813 Prickly, Leaves fingered, Leaflets linear lanceolate at the end toothed or entire
3814 Leaflets oblong entire sessile acute on each side smooth, Panicle terminal long
3815 Leaflets obovate sessile very narrow at the base smooth on both sides, Corymbs axillary

## 3816 Leaves obovate

3817 Leaves stalked ovate retuse crenated, Panicle twice as short as leaf
3818 Leaves stalked ovate subserrate entire at base
3819 Leaves sessile entire obovate coriaceous
3820 Leaves stalked ovate subserrate, Peduncles dichotomous shorter than the leaves, Fruit ovate
3821 Leaves like the mountain ash, Flowers in long erect panicles from among the leaves

3822 Leaves pinnate
3823 Leaves ternate

and Miscellaneous Particulars.
different constitutions; and some are incapable of being poisoned with it at all. Persons of irritable habits are most liable to receive it.

Rhus aromatica and suaveolens, the male and female of one species, have been made into a distinct genus called Schmaltzia, by Desvaux and Turpinia, and afterwards Lobadium, by the ingenious M. Rafinesque Schmaltz. The expressed oil of the seed of this species, and also of R. succedanea, acquires the consistence of suet and serves for making candles.
R. Toxicodendron is poisonous to some persons, like $R$. vernix, but in a less degree. Kalm relates, that of two sisters, one could manage the tree without being affected by its venom, whilst the other felt its exhalations as soon as she came within a yard of it, or even, when she stood to windward of it, at a greater distance; that it had not the least effect upon him, though he had made many experiments upon himself, and once the juice squirted into his eye; but that on another person's hand, which he had covered very thick with it, the skin, a few hours after, became as a piece of tanned leather, and peeled off afterwards in scales.
R. pumila is another dangerous species. Lyons, the collector, suffered severely for several weeks, after only collecting the seeds.
$R$. cotinus is cultivated for tanning leather near Valcimara in the Apennines, where it is called Scotino.
682, Cassine. An American name. These are shrubs with handsome foliage, but generally inconspicuous white or green flowers. C. Maurocenia has its specific name in honor of the Venetian senator $\mathbf{F}$. Mauroceni, who had a fine garden at Padua
683. Spathelia. The upright habit and want of branches make this tree resemble a palm-tree, anciently called $\Sigma \pi \alpha \pi \%$. A very handsome stove shrub, rarely flowering.
684. Staphylea. From $\sigma \tau \propto \varphi u \lambda \eta$, a bunch, in which form its fructification is disposed. Handsome hardy

History, Use, Propagation, Culture,
shrubs. S. pinnata has hard smooth nuts, which are strung for beads by the Catholics in some countries, while in others the kernels, though bitter, are eaten by the inhabitants.
685. Tamarix. Tamarisci were people who inhabited the Spanish side of the Pyrenees, where one species grows abundantly on the banks of the Tanaris, now called the Tambra. T. gallica, as it stands the sea breeze, is sometimes used as a hedge plant in such situations.
686. Turnera. So named by Plumier, in memory of William Turner, M. D. Prebendary of York, \&c, author of "A new Herball," London, 1551 : died in 1568. All the species are of the easiest culture, but few of them of any beauty. They are chiefly weeds with yellow Cistus-like flowers.
687. Drypis. From ǫuxia, to tear. Its leaves are armed with stiff spines.
688. Alsine. From ajoos, shady place, where alsine loves to grow. Little weeds of no beauty. Morgeline, Fr.
689. Telephium. Pliny says, Telephus was a king of Mysia, and had his wounds cured by Achilles with this plant. A little inconspicuous weed, with the appearance of a minute Euphorbia.
690. Corrigiola. A diminutive of corrigia, a thong; and applied to the plant we call Polygonum avioulare,

# 3824 Bractes shorter than flower-stalks, Spikes lateral panicled, Leaves lanceolate subulate stem-clasping 3825 Flowers sessile, Spikes lateral, Leaves very short sheathing, Branches with turbinate mucronate joints 3826 Spikes terminal solitary, Bractes longer than flower-stalks, Leaves linear lanceolate sessile 

3897 Flowers sessile, Leaves oblong acute serrate pubescent with two glands at base
3828 Flowers sessile, Leaves ellipt. cuneate obtusely serrated scabrous with two glands at base
3829 Bractes subulate, Leaves ovate acute at each end with two glands at the base
3830 Flowers sessile, Leaves without glands
3831 Peduncles axillary leafless, Leaves serrated at end
3832 Raceme terminal long, Leaves ovate unequally obtusely serrated
3833 A small glaucous plant with rigid prickly leaves
3834 Petals bipartible, Leaves ovate cordate
3835 Petals entire, Leaves subulate
3836 Petals entire short, Leaves bristly, Calyxes awned
3857 Leaves alternate
3838 Flowers stalked, Calyxes membranous at edge
3839 Stem diffuse procumbent, Leaves oblong ovate, Branches leafless
$38+0$ Peduncles umbelled lateral as Iong as linear leaves
3871 Umbels unequal, Leaves linear distant
3842 Peduncles 1 -flowered lateral, Flowers as long as leaves, Stem depressed
3843 Common peduncles very long, Leaves linear, Stipules hairy
3844 Peduncles axillary elongate dichotomous, Leaves whorled linear
3845 A fleshy shrub with many small opposite fleshy roundish leaves
3846 Leaves flat, Peduncles simple
3847 Leaves round ovate, Spikes lateral
3848 Leaves ovate wavy,. Peduncles simple longer than the leaf
3849 Leaves cordate, Peduncles clustered branched
3850 Leaves cordate roundish, Peduncles simple shorter than the leaf

## TETRAGYNIA.

3851 Radical leaves cordate acuminate, Nectaries many-parted
3852 Radical leaves nearly orbicular, Nectaries with 3 bristles
3853 Radical leaves reniform, Petals unguiculated, Nectaries 3-parted

## PENTAGYNIA.

3854 Leaves linear lanceolate sessile, Peduncles 1-3-f. a little longer than the leaves
3855 Leaves reniform repand
3856 Leaves roundish, Stem creeping, Flowers nearly sessile

and Miscellancous Particulars.
in allusion to the long and slender shoots of that plant. The Corrigiola of modern times is related to the Polygonum.
691. Pharnaceum. Named after Pharnaces, king of Pontus, who is sald by Pliny to have been the first to use the plant. Pretty little herbaceous plants, with tine leaves, and elegant umbels of usually white flowers.
692. Portulac ria; that is to say, a Portulaca-like plant. The leaves of this plant resemble purslane, whence also the English name, as well as the Latin name
693. Basella. A Malabar name. The species of this genus are used in China as spinage plants: they are alsn raised on a hotbed at Paris in spring, and transplanted into a warm border for the same purpose, and are said to furnish a summer spinage equal to that of the orache.
694. Parnassia. From Mount Parnassus, the abode of grace and beauty, where, on account of the elegance of its form, this plant is feigned to have first sprang up. P. palustris is one of the most elegant of marsh plants, well deserving a place in aquatic collections.
695. Evolvulus. Derived from evolvo, to turn; in the same sense as Convolvulus, which this genus entirely resembles in habit.

## History，Use，Propagation，Culture．

696．Aralia．A name of unknown meaning，under which one species was sent to Fagon from Quebec，in 1764，by one Sarrazin，a French physician．A．spinosa is an ornamental low tree for lawns，on account of its Angelica－like leaves．
697 ．Actinophyllum．From $\alpha$ ． $2 \sigma 6$, a ray，and $\& u \lambda \lambda o v$, a leaf；because the leaflets are disposed as it were in ravs round a centre．Fine Aralia－like plants，with beautiful foliage，but not with any atraction in the appear－ ance of the Howers．

3857 Procumbent villous, Leaves oval subsessile, Capsules deflexed
3858 Very hairy, Leaves subsessile oblong cordate acuminate, Flowers sessile 3 together
3859 Arborescent, Stem and leaves prickly
3860 Stem suffruticose and leaf-stalks hispid, Leaves decompound
3861 Stem herbaceous smooth, Leaves decompound, Peduncles axillary branched umbelled
3862 Stemless, Leaves decompound, Scapes leafiess
3863 Leaflets 5 very smooth shining elliptical entire
3864 Leaves opposite nearly connate oblong with an auricle on one side, falcate
3865 Leaves ovate oblong flat, edge with a cartilagin, fringe, at the base connate sheathing, Flowers term, sessile
3866 Leaves linear with a cartilaginous fringed edge, Stem shrubby, Cyme terminal
3867 Leaves flat connate perfoliate smooth, Flowers in corymbose panicles
3868 Leaves linear flat fringed with cartilage connate sheathing at base, Flowers terminal sessile
3869 Stem decumbent, Leaves ovate cruciate, Head 2-flowered, Petals connate
3870 Frect, Leaves oblong lanceolate with cartilaginous teeth at base sheathing, Umbels double many-flow.
§ 1. Shrubby, Leaves subulate.
3871 Leaves lanceolate subulate sessile connate channelled convex beneath
3872 Leaves subulate above flat connate perfoliate smooth much spreading, Pedunc. long, Flowers cymose
3873 Leaves subulate incurved obscurely 4 -cornered spreading, Stem erect shrubby rooting
3874 Leaves $\frac{1}{2}$ cylindrical acute gibbous beneath smooth nearly erect, Cymes terminal compound
3875 Leaves connate rounded subulate spreading, Cymes few-flowered on long stalks, Stem shrubby decumbent 3876 Leaves subulate radical, Stem naked
§ 2. Shrubby, Leaves broad, smooth.
3877 Leaves roundish acute glaucous fleshy dotted, Cyme trichotomous
3878 Leaves opposite ovate oblique entire acute distinct somewhat cartilaginous at edge
3879 Leaves ovate attenuate at base connate entire dotted inside the edge, Cymes panicle-shaped
3880 Leaves opposite obovate cultrate oblique connate entire
6 3. Shrubby, Leaves broad, distant, ciliated.
3881 Leaves opposite oval flattish distinct fringed, Corymbs terminal
3882 Leaves connate ovate expanded cartilaginous crenated; upper ovate elliptical wavy, Stem dichotomous
3883 Leaves opposite spreading connate raugh fringed, Stem rough backwards
3884 Leaves linear obtuse sheathing convex on both sides, Flowers cymose, Stem decumbent
3885 Leaves obl. con obtuse falcate with a cartilaginous fringed edge, Pan. long, Pedunc. opposite clustered
3886 Leaves obovate subconnate, Branches axillary few-flowered, Petals lancenlate reflexed
3887 Leaves lanceolate convex beneath, Corymbs small axillary, Petals lanceolate

> 4. Shrubby, Leaves broad, very closely imbricated.

3888 Leaves round imbricated, Fascicle round terminal
3889 Leaves ovate acute smooth imbricated in rows, Flowers axillary sessile
3890 Leaves radical decussately imbricated tringed lanccolate cultrate hoary

> y 5. Shrubby, Leaves broad, very much perfoliate.

3891 Leaves connate perfoliate cordate dotted
3892 Leaves opposite ovate dotted fringed, Lower oblong
3893 Leaves cordate perfoliate acuminate flat spreading dotted within the edge
3894 Stem flaccid creeping, Leaves opposite
6. Shrubby, Leaves stalked.

8895 Leaves stalked cordate roundish acute crenate, Corymbs panicle-shaped 3896 Leaves stalked cordate obtuse entire, Cymes panicle-shaped

> 8 7. Herbaceous.

3897 Villous, Leaves connate lanceolate fringed, Stem nearly naked terminal, Spike whorled
3898 Lower leaves distinct opposite tongue-shaped ciliated pubescent, Flowers whorled sessile close, Stem leafy 3899 Leaves connate oblong downy fringed, Stem rather naked, Flowers corymbose close
3900 Leaves oblong obtuse cartilaginous-fringed tufted, Scape panicled, Branches opposite cymose
8. 8. Annual or biennial.

3901 Leaves connate oblong remote flat, Stem simple, Cyme compound, Flower stalks bent backwards 3902 Leaves cordate sessile, Peduncles terminal axillary approximate umbellate
3903 Stem dichotomous, Leaves sessile oblong ovate cordate flat, Peduncles axillary 1-flowered
3904. Stem dichotomous, Leaves sessile ovate oblong channelled recurved, Peduncles axillary 1-flowered 3905 Stem dichotomous rough, Leaves lanceolate, End flowers in bundies

and Mascellaneous Parliculars.
698. Rochea. Named after M. de la Roche, author of "Historia Eryngiorum," a work of reputation. This succulent genus thrives well in sandy loam, and requires but little water. "Young cuttings taken off and laid to dry a few days, and then potted, or stuck in the tan, will root directly." (Sweet.)
649 . Crassula. From crassus, thick, in allusion to the fleshy nature of the leaves and stems of all the species. These plants grow best in sandy loam and brick rubbish, with the pots well drained. "Cuttiags root

History, U'sc, Propagation, Culture,
easily if laid to dry a few days after cutting off, before they are planted, to dry up the wound, that they may not rot. They require no covering, but may be placed in any convenient situation." (Sweet.)
700. Gisekia. In honor of $\mathbf{P}$. I. Giseke, a Danish botanist, who lived about the end of the last century. A small weed-like piant, with the habit of Chenopodium.
701. Linum. Llin, in Celtic, signifies thread, whence $\lambda_{\text {vov, }}$ in Greek, and linum, and its derivations, in Latin. L. usitatissimum, is a well known thread or clothing plant, which has been cultivated from the remotest antiquity for its cortical fibres, or boon, which, when separated from the woody matter or harl, as it is technically called by the growers, forms the lint and tow which is spun into yarn, and wove into linen cloth. The seeds are sown on well comminuted loamy soil, which is in good heart, in April, broadcast: during summer weeds are carefully removed; and when the plant is in full flower, or (if seed is desired) when the seed capsules are ripe, it is pulled up by the roots, the capsules torn off by a comb, and the stalks tied in bundes and carried to a pond or pool of stagnated water. Into this water the bundles are thrown, and kept under the surface by being loaded with planks, stones, \&c. for ten days or a fortnight, till an appearance of decay or softness is indicated by the bark ; they are then taken out and spread on the grass, or on the gravelly banks of a river for a fortnight, where the alternate dews and heats accelerate the progress of decay. It is next taken up, and when quite dry tied into bundles and stacked till wanted by the flax-cleaner. Some cultivators do not steep the flax in water, but only spread it on the surface of grass ground, which is called dewretting, and has nearly the same effect as the other; but the more recent practice, not yet however very general, is neither to steep or dew-ret, but to dry, bind, and stack as in saving a crop of corn, and afterwards to seprate the causules and the fibre by machinery. By this process the fibre is obtained of mach greater

## 3906 Stem dichotomous pubescent, Leaves linear-lanceolate, End flowers in bundles

3907 Ireaves ovate acute distinct ciliated, Stem simple downy, Raceme compound, Branches panicled
3908 L.eaves oblong lanceolate acute connate ciliated, Stem smooth, Raceme elongated, Fl. in bundles sessile 3909 Leaves fusiform depressed, Cyme 4-fid leafy, Flowers sessile, Stamens reflexed
3910 Ieaves spreading, Flowers whorled awned
3911 Leaves half cylindrical subulate channelled above spreading, Peduncles axillary solitary l-flowered 3912 Leaves alternate somewhat spatulate acute entire, Raceme compound
3913 Leaves oblong narrowed at base remotely crenate, Peduncles opposite the leaves and axillary solitary
3914 Stem procumbent, Leaves connate oblong acute, Peduncles axillary 1-fiowered, Flowers tetrandrous

## 3915 Leaves elliptical lanceolate

3916 Sepals ovate acute 3-nerved, Petals crenate, Leaves lanceolate, Stem nearly solitary
3917 Scpals and leaves lanceolate subulate 3-5 nerved smooth, Stems branched at end
3918 Sepals $\jmath b o v a t e$ obtuse about 5 -nerved smooth, Stems numerous ascending
3919 Leaves elliptical acute nearly entire, Styles 3, Cap ules 6-celled
3920 Sepals hairy acuminate sessile alternate, Leaves alternate; of the branches opposite
3921 Sepals hairy acuminate, Flowers spiked, Spikes revolute, Leaves cordate-ovate pubescent
3922 Sepals acuminate, Leaves lanceolate scattered upright rough acuminate, Stem rounded branched at base 3923 Sepals acuminate, Leaves ovate lanceolate acuminate reflexed smooth, Filaments connate
3924 Sepals acuminate, Ieaves scattered setaceous rough backwards
3925 Sepals elliptical 3-nerved and capsules acuminate, Leaves linear lanceolate 3-nerved, Stems numerous 3926 Sepals subulate acute, Leaves linear lanceolate, Peduncles pf panicle about 2 -flowered, Flowers sessile 3927 Sepals ovate acute blunt, Leaves lanceolate lower opposite
3928 Sepals rounded obtuse, Leaves linear acutish, Stems declinate
3929 Sepals rounded obtuse, Leaves linear straight acute
3930 Sepals acute alternate, Capsules pointless, Stem panicled, Leaves lanceolate : radical ovate
3931 Sepals ovate acuminate 3-nerved fringed, Leaves very stiff short, Petals oblong very narrow
$39: 32$ Sepals acuminate scabrous, Leaves with two glands at base, smooth at edge, Cor, monopetalous
3933 Base of the leaves dotted with glands on both sides
3934 Sepals subulate, Leaves lanccolate upright mucronate rough at edge
3935 Leaves linear acute rough, Stems half shrubby
3936 Leaves wedge-shaped, Stems arborescent
3937 Leaves linear lanceolate, Flowers terminal stalked
3938 Flower leaves Ianceolate, Flowers alternate sessile, Cal. as long as leaves
3939 Leaves obovate lanceolate entire, Stem dichotomous upwarts, Petals acute
3940 Leaves 4-together
3941 Leaves orbicular radical, Scape racemose erect
3942 Scapes radical ascending, Leaves oval, Stigmas emarginate
3043 Scapes radical erect, Leaves oblong lanceolate, Stigmas clavate
3944 Scapes radical branched, Leaves filiform very long
3945 Leaves cordate ovate acuminate unequally tooth-serrated, rough above downy beneath 3946 Leaves long cordate unequally serrate hairy on both sides

and Misccllaneous Partuculars.
strength; there is less loss of seed, less demand for labor at a busy season, and the refuse of the operation forms an excellent food for horses or cattle. The machines for breaking and cleaning flax are worked by hand, and the best at present is considered that of Bundy. The process of steeping and spreading flax has the further effect on the fibre of bleaching it: when the machine is used, the bleaching progress is effected by steeping in soft soap. Flax seed yields by expression a valuable oil; in powder it is much used in poultices; and the refuse, after pressing for oil, forms a cake fit to feed,broken-winded horses, to fatten cattle, and for manure.
L. perenne may be used for the same purpose as the other : both species have been proposed by some gardeners to be adopted as border-flowers.
702. Drosera. From $\delta \rho o \sigma o s$, dew, on account of the pellucid dew-like glands on the surface of the leaves, whence also our English name sun-dew. The famous Italian liqueur is called Rossoli, on account of the usage of this plant in its composition. D. rotundifolia is an acrid caustic plant, by some supposed to occasion the rot in sheep: it curdles milk, removes warts and corns, and takes away freckles and sunburn: distilled with wine it produces a very stimulating spirit, and it was formerly much used as a tincture spiced and sweetened. The leaf hairs support globules of clear liquor even in the hottest weather, are very irritable, and close upon small insects that touch them, after which the leaf itself bends and holds the dead insect imprisoned.
703. Commersonia. Named by Forster in memory of M. Commerson, the French traveller and botanist, who accompanied Bougainville in his voyage round the world. He stopped at the Isle of France, where he died in 1774, after having discovered an immense quantity of new plants. C. dasyphylla is a pretty flowering shrub: both syecies grow freely from cuttings in sand under a hand-glass.

History, Use, Propagation, Cullure,
704. Rutingia. Named in honor of J. P. Rüling, author of an Essay on the Natural Orders. A plant related to Commersonia
705. Armeria. Dexivation unexplained. This is a genus of handsome plants, for the most part well suited for rock-work, or growing in pots. A. vulgaris is considered the most valuable edging plant next to the box.
706. Statice. From $\sigma \pi \alpha \tau \zeta \zeta$, to stop. This plant, says Pliny, stops diarrhcea. This is a very ornamental

3948 Scape rounded smooth, Outer leaves of involucrum acute, Leaves linear flat obtuse
3949 Scape rounded pubescent, Leaves of involucr. obtuse, Leaves linear flat obtuse ciliated at base
3950 Scape compressed smooth, Leaves of involucr. ellipt. rounded, Leaves lin, flat acute membr, at edge
3951 Scape long, Bractes 2 or 3 longer than head, Leaves linear stiff smooth
3952 Scape rounded smooth, Outer leaves of involucr. lanceol, acute as long as head, Leaves lin. flat fringed
3953 Scape rushy, Leaves linear lanceolate acute flat narrowed downwards
3954 Quite smooth, Scape simple, Leaves linear flat, the first toothletted, Leaves of involucr. ovate lanc. acum.
3955 Scape rounded roughish, Outer leaves of invol. obl. ov. acute: inner obl. obtuse, Leaves lanc. flat 3-nerved
3956 Scape rounded smooth, Outer leaves of involucr. elliptical mucronate, Leaves lanc. flat acute 3-nerved
3957 Leaves long lanceolate entire smooth 3-nerved acute soft, Leaves of involucr. acute edged
3958 Scape rounded smooth, Leaves of involucr, elliptical obtuse, Leaves linear acute channelled

3959 Branches 3-cornered, Leaves linear channelled
3960 Scape panicled rounded, Leaves wavy at edge oblong smooth obtuse mucronate beneath
3061 Scape panicled pubescent, Leaves elliptical mucronate beneath and nearly smooth
3962 Scape panicled much branched and lvs. ovate oblong obtuse somewhat wavy, beneath mucronate smooth
3963 Scape panicled much branched rough, Leaves pubescent, Hairs in starry bundles
3964 Scape panicled rounded, Lower branches sterile, Leaves oblong spatulate obtuse smooth nearly blunt
3965 Scape simple rounded, Spikes lateral and terminal 1-sided, Leaves spatulate acute
9966 Leaves spatulate emarginate, Scape erect panicled, Upper branches simple, Lower bifid, Flow, 1 -sided
3967 Scape panicled, Leaves spatulate retuse
3968 Leaves somewhat radical obovate-oblong obtuse, Branches rough
3969 Lvs. lanc. wedge-shaped acute, Scape erect roughish branched panicled, Fl. 1-sided, Cal. at edge membr.
3970 Lvs. lanc. cuneate olbtuse, Scape decumbent branched panicled, Fl. branches long, Bractes mem. at edge
3971 Lvs. spatul, ret. Scape erect branched rough, Sterile branches pectinate, Fl. very close, Brac. transparent
3972 Rough with hoary dots, Scape panicled rounded jointed much branched divaricating, Leaves spatulate
3973 Radical leaves spatulate obtuse glaucous entire on long stalks, Scape rounded, Flowers racemose 1-sided
3974 Scape branched neariy round, Branches 2-edged winged, Fl. imbricated, Lvs, obov. cuspidate mucronate
3975 Scape leafy, Branches 3-cor. winged, Fl. aggregate in interrupted spikes, Bractes acum. longer than cal.
3976 Scape dichotomous, Leaves lanceolate mucronate, Flowers alternate distant
3977 Scape dichotomous corymbose, Spike-headed, Fl. imbricated, Lvs. lanc. wedge-shaped mucronate 3-nerved
3978 Stem leafy, Leaves obovate wedge-shaped 3-nerved mucronate
3979 Stem shrubby leafy, Leaves clustered wedge-shaped smooth pointless, Scape few-flowered
3980 Stem and branches panicled 3-cornered, Leaves obovate stalked, Spikes 1 -sided
3981 Stem shrubby naked above and branched, Heads sessile, Leaves lanceolate sheathing
3982 Stem shrubby leafy, Flowers solitary, Leaves lanceolate sheathing
3983 Stem shrubby branched, Branches imbricated, Paleæ with a bristle at end
3984 Stem herbaceous two-edged, Radical leaves lyrate ; cauline linear
3985 Stem winged, Radical leaves sinuate; cauline lanceolate, Peduncles cuneate 3-winged
3986 Stem crisp, Leaves elliptical entire, Spikes 1 -sided
3987 Scape panicled rounded, Branches clustered, Leaves obovate spatulate mucronate smooth, Cal. acute
3988 Scape panicled, Leaves lanceolate 3-nerved wavy mucronate at end, Branches of panicle 3-cornered
3989 Leaves broad lanceolate glaucous mucronate, scape winged, Flowers close corymbose
3990 Radical leaves alternately pinnatifid sinuated, Intermediate segments of cor. linear

## POLYGYNIA.

3991 Leaves quite entire

3992 Horns of the pericarp falcate ascending

and Miscellaneous Particulars.
genus; the species are not common, and require a little care in cultivation, Statice speciosa and tatarica, are among the prettiest of hardy border flowers. S. limonium is an inhabitant of salt marshes in many parts of England, whence its name, from $\lambda$ sthov, a marsh.
707. Myosurus. From $\mu$, Mus receptacle, which looks exactly like the tail of a mouse.
708. Ceratocephalus. From $\approx \varepsilon \rho \alpha 5$, a hom, and $\approx \in \varnothing \propto \lambda$, a head, on account of the horm-like ends $\boldsymbol{\sigma}$, the srads in the heads of the capsules.

History, Use, Propagation, Culture, and Miscellaneous Particulars.
709. Xanthorhiza. From $\xi_{\varepsilon y} 905$, yellow, and posce, a root, on account of the deep yellow color of the roots. A small shrub, with much cut leaves, and branches of dull purplish brown small flowers.
710. Sibbaldia. So named by Linnæus, in memory of Sir Robert Sibbald, professor of physic at Edinburgh; author of Scotia Illustrata, \&c. 1684. Small alpine plants, with the aspect of Alchemilla.

Class VI. - HEXANDRIA. 6 Stamens.

This class contains the most beautiful of the herbaceous plants of our gardens. With a few exceptions, it is to a considerable degree a natural assemblage, comprehending a large proportion of those favorites of gardeners, the orders Amaryllideæ, Asphodeleæ, Bromeliaceæ, Liliaceæ, and Melanthacer. The class also includes a few grasses and palms, some genera of Berberideæ, all Hypoxideæ, and many Junceæ.

The Amaryllideæ, or lilies of the hot-houses, consist of a number of beautiful species, the generic distribution of which is uncertain, and difficult to determine. Much attention has been paid to the subject by Messrs. Ker, Herbert, and others; by the former, perhaps, with the most success; a great deal still remains to be done. The limits of the genera are very obscure, and their extreme characters similar. Among the Bromeliaceæ are found the delicious pine-apple, and the curious Tillandsias, some of which are called air-plants. The asparagus and the officinal squill are included in Asphodeleæ. To the same class are related the lily of the valley, the Solomon's seal, and many other curious little plants. The Phormium tenax, which produces the strong flax of New Zealand; the aloes, curious for their fantastic foliage; the fragrant tuberose; the plantains, so valuable as an important article of food in all the tropics, are all contained in this class. Hither also, are referred the valuable rice, the curious bamboo, and the rush, some of the species of which are well known for their use in ceconomical purposes, others as the most worthless weeds of our heaths.

Hexandria Trigynia is chiefly made up of the natural order Melanthaceæ, among which the Colchicum and Trillium are found,

Order 1. MONOGYNIA.

## 1. Monocotyledons. Perianth superior, colored.

## A. Perianth with the orifice surmounted by a corona or nectary.

711. Narcissus. Sepals 6, equal. Cup funnel-shaped, of a single leaf. Stamens inserted within the cup. 712. Pancratium. Flower funnel-shaped, with a long tube. Sepals 6. Cup 12-cleft, membranous. Stamens inserted on the edge of the cup.

713 Eucrosia. Flower ringent nodding. Crown formed by the dilated bases of the stamens. Stamens declimate, united into a tube, which is split on its upper side.
714. Eurycles. Flower funnel-shaped, regular. Crown fleshy, short. Stamens inserted into the edge of the cup.
715. Chlidanthus. Flower funnel-shaped, irregular. Stamens erect, included, united by their dilated bases; the short filaments 2 toothed. Anthers innate. Ovary 3-celled, many-seeded. Style filiform. Stigma 3-lobed. Capsule cartilaginous, 3-valved. Seeds membranous.
716. Calostemma. Flower funnel-shaped, with a 6 -parted limb. Crown tubular, with a 12 toothed mouth, the alternate teeth anther-bearing. Ovary 1-celled, 2-3-seeded. Style filiform. Stigma obtuse. Berry 1-2-seeded.
717. Chrysiphiala. Flower funnel-shaped, with a tube narrowed downwards thickened at the base, with a dilated b-cleft limb. Crown 6-cleft. Stamens erect, tipright. Stigma thickened, obsoletely trifid.

## 3993 Roots very yellow, Leaves compound

3994 Leaves ternate, Leaflets smooth above hairy beneath, Flowers corymbose, Petals as long as calyx 3995 Procumbent, Leaves ternate, Leaflets 3-toothed on each side rough with hairs, Flowers clustered 3996 Leaflets linear multifid, Plant erect

## B. Perianth with the orifice naked. <br> * Stigma undivided.

718. Lophiola. Flower woolly, 6-parted, bearded inside. Authers erect. Filaments naked. Ovary nearly superior.
719. Argolasia. Flower woolly, longer than the filaments : limb 6-parted, spreading. Pericarp 3-celled.
720. Anigozanthus. Flower tubular, incurved : with a 6 -parted irregular limb. Stamens inserted into the mouth, ascending.

## * Stigma 3-lobed. Guzmannia has Perianth inferior.

721. Musa. Spathe superior. Cor, of 2 petals: one of which is erect and 5-toothed; the other concave and honey-bearing. Berry oblong, 3-cornered, many-seeded,
722. Urania. Cal. O. Cor. 3 petals. Nect. 2leaved : one of the leaves bifid. Caps, 3-celled, many-seeted. Seeds in two rows with an arillus.
723. Bonapartea. Calyx 2leaved. Petals 3 convolute. Stamens inserted in the receptacle. Anthers exserted. Style 3-comered. Caps. 3-celled, 3-valved. Seeds numerous, terminated by a bristle.
724. Agave. Flower erect, tubular, or funnel-shaped. Filaments longer than flower, erect. Capsule triangular, many-seeded.
725. Furcraa. Flower campanulate, 6-parted. Stamens inserted in a gland, thickened downwards, compressed, subulate at end. Capsule 3-valved, 3-celled, many-seeded.
726. Bromelit. Cal. 3-fid. Petals 3. A honey-bearing scale at base of petal. Berry 3-celled.
727. Guzmannia. Cal. 3-parted, not superior, with convolute segments. Petals 3, rolled together into a tube. Anthers united in a cylinder. Caps. 3-celled, 3-valved. Seeds numerous, oblong, naked.
728. Pitcairnia. Cal. 3-leaved, half inferior. Petals 3. Stigmas 3, twisted together. Caps, 3, opening inwards. Seeds winged or terminated at each end in a long bristle.
729. Tillandsia. Cal. 3-fid, persistent, convolute. Cor. 3-fid, campanulate. Caps. 1-3-celled. Seeds comose.
730. Pontederia. Flower monosepalous, 6-cleft, 2-lipped. Stamens inserted into the tube of flower at the top. Caps. 3-celled.
731. Hamanthus. Involucre many-leaved, many-flowered. Flower 6-parted. Berry 3-celled.
732. Galanthus. Sepals 3, concave. Cup formed of 3 small emarginate sepals. Stigma simple.
733. Leucoium. Flower campanulate, 5-parted, with the ends of the sepals thickened. Stigma simple.
734. Strumaria. Sepals 6, spreading. Style thickened below the middle, and cohering occasionally with the filaments. Stigma trifid. Capsule inferior, roundish, 3-celled.
735. Crinum. Flower funnel-form, half six-cleft, with a filiform tube, and a spreading recurved limb, Sepals subulate, channelled. Seeds fleshy.
736. Cyrtanthus. Flower incurved, tubular, clavate, 6-cleft: segments ovate, oblong. Filaments inserted into the tube, conniving at end.
737. Brunsvigia. Flower 6-parted. Capsule turbinate, 3-winged, nearly transparent, many-seeded.
738. Nerine. Sepals 6, spreading, wavy. Stamens declinate, unequal in direction or proportion. Capsule few-seeded. Seeds round like peas.
739. Amaryllis. Flower nodding, irregular, funnel-shaped, ringent. Filaments declinate, unequal in proDortion or direction. Seeds flat, numerous.
740. Vallota. Flower vertical, regular. Stamens regularly spreading. Seeds numerous, flat.
741. Griffinia. Flower 6-parted, ringent. Stamens declinate, with the upper one erect, and away from the rest. Seeds few, round, fleshy.
742. Sternbergia. Flower vertical, regular, funnel-shaped, with an erect limb. Stamens slightly declinate. Anthers versatile. Seeds round like peas.
743. Zephyranthes. Flower vertical, nearly regular, funnel-shaped, with an erect limb. Stamens nearly regular. Anthers versatile. Seeds flat.
744. Habranthus. Flower campanulate, nodding Stamens deciinate, unequal, inserted into a fleshy rim of the base of the tube. Stigma 3-lobed.
745. Doryanthes. Flower 6-parted. Filaments shorter than flower. Anthers erect.
746. Gethyllis. Flower 6-parted, with a filiform very long tube. Spathe obliquely truncated. Berry clavate, radical, 1-celled.
747. Polyanthes. Flower funnel-shaped, incurved. Filaments inserted into the throat. Ovary at the bottom of tube.
748. Alstremeria. Sepals 6, campanulate or 2-lipped, the two lower half-tubular at the base. Stamens declinate or erect. Stigmas 3, linear. Caps. roundish-oval, 3-6-angular, 3-valved, or pulpy within, and not opening.
749. Conanthera. Sepals 6, reflexed. Anthers united in an acute cone. Caps. oblong, 3-celled, 3-valved. Seeds few, roundish.
750. Hypoxis. Spathe 2-valved. Flower 6-parted, superior. Caps. long, narrow at the base. Seeds roundish, naked.
751. Curculigo. Sepals 6, flat. Spathe of one valve. Style very short. Stigmas 3, diverging. Caps. 1-celled, 4-seeded, spongy, beaked.

## 2. Monacotyledons. Perianth inferior. <br> A. Perianth glumaceous, irregular.

752. Bambusa. Scales 3, covering the 5-flowered spikelets, Glume 2-valved. Style bifid. Seed 1.
753. Calamus. Sepals 6. Berry dry, 1-seeded, imbricated backwards.
754. Ehrharta. Glume 2-valved, abbreviated, 1-flowered. Palea 4, in pairs, the outer compressed acinaci form, transversely wrinked.

## B. Perianth not coloured, regular. Stems herbaceous. Aroideæ and Junceæ.

755. Acorus. Spadix cylindrical, covered with florets. Sepals 6, naked. Style O. Caps. 3-celled.
756. Orontium. Spadix cylindrical, covered with florets. Sepals 6, naked. Style O. Follicles 1 -seeded.
757. Tupistra. Cor. 1-petalous, 6-fid, nearly equal. Anthers sessile in middle of sepals. Style 3 cornered, thick. Stigma clypeate, 3-lobed.
758. Tacca. Cal. 6-parted. Cor. 6-petalous, inserted into the calyx, bearing the anthers. Stigma stellate. Berry dry, hexangular, many-seeded.
759. Aspidistra. Cor. 1-petalous, 6-fid, equal. Anthers at bottom of tube. Style stipitate. Stigma clypeate.
760. Juncus. Sepals 6, persistent. Stigmas 3. Caps. 1-celled, 3-valved. Seeds very numerous.
761. Luxula. Sepals 6. Stigmas 3. Caps. 1-celled, 3-valved, 3-seeded. Seeds fixed to a central receptacle.
C. Perianth not colored, regular, Fruit, a drupa. Stems arborescent. Palms.
762. Corypha. Cal. 3-leaved. Cor, of 3-petals. Berry 1-seeded. Seed large, round, bony.
763. Licuala. Cal. 3-parted. Cor. 3-parted. Cup truncated, band-like. Drupe 1 -seeded.
764. Thrinax. Cal. 6-toothed. Cor. O. Stigma funnel-form, oblique. Berry 1-seeded.
D. Perianth partly or wholly colored, regular.
765. Tradescantia, Cal. 3-leaved. Petals 3. Filaments with jointed hairs. Caps. 3-celled.
766. Dichorizandra. Cal, 3-leaved. Petals 3. Two of the stamens separate from the rest. Caps. 3-celled. 767. Agapanthus. Flower funnel-shaped, regular, six-parted. Stamens declinate.
767. Blandfordia. Flower tubular, withering, with a 6-lobed mouth. Stamens inserted on the tube. Anthers fixed to a base like an extinguisher. Ovary stalked. Stigma simple. Capsule 3-partible, Seeds in two rows, with a loose downy skin.
768. Hemerocallis. Flower campanulate, with a cylindrical tube. Stamens declinate. Stigma small, simple, villous.
769. Aloe. Flower tubular, with a 6-cleft spreading mouth, and honey at the bottom of the tube. Filaments inserted into the receptacle. Caps. 3-celled, 3-valved, many-seeded. Seeds in two rows, with a membranous edge.
770. Lilium. Sepals 6, campanulate, with a longitudinal honey-line, and generally reflexed. Valves of the capsule connected by a mesh of hairs.
771. Tulipa. Sepals 6, campanulate. Style O.
772. Fritillaria. Sepals 6, campanulate, with a honey-pore above the claws.
773. Dracena. Flower fparted, erect. Filaments thickest in the middle, or simple. Berry 3-celled, 1 seeded.
774. Phylloma. Flower 6-parted, tubular. Sepals imbricated. Stamens hypogynous, included. Style setaceous. Stigma simple. Berry coriaceous, many-seeded.
775. Aletris. Flower funnel-shaped, wrinkled. Stamens inserted into base of segments, Capsule 3-celled, with many seeds.
776. Tritoma. Flower 6-toothed. Stamens inserted into the receptacle, exserted, alternately longer. Capsule 3-celled, many-seeded.
777. Veltheimia. Flower tubular, 6-toothed. Stamens inserted in the tube. Caps. membranous, 3-winged, with 1 -seeded cells.
778. Sanseviera. Cor. monosepalous, with a filiform tube, and a 6 -parted revolute limb. Stamens inserted into the limb. Berry 1-seeded.
779. Tulbaghia. Flower funnel-shaped, with a 6-cleft limb. Crown of the throat 3-leaved; the leaves bifid as large as the segments.
780. Yucca. Flower campanulate, spreading. Style O. Caps. 3-6-celled, with a hole at the end.
781. Erythronium. Sepals 6, campanulate. Two little tubercles attached to the base of every other sepal.
782. Gloriosa. Sepals 6, wavy, reflexed. Style oblique, trifid at end.
783. Bulbocodium. Sepals 6, funnel-shaped, with narrow claws bearing the stamens.
784. Uvularia. Sepals 6, erect. A hollow at the base of the sepals. Filaments very short. Flowers solitary, axillary. Capsule compressed, 3-comered. Seeds with an arillus.
785. Streptopus. Sepals 6, campanulate. Stigmas very short. Berry globose, polished, papery. Seeds naked.
786. Convallaria. Flower 6-cleft, campanulate. Berry spotted, 3-celled.
787. Smilacina. Flower 6-parted, spreading. Filaments diverging, fixed to the base of the segments. Berry globose, 3-celled. Flowers terminal, panicled, or umbelled.
788. Polygonatum. Flower 6-cleft, cylindrical. Filaments inserted into top of tube. Berry globose, 3-celled, with 2 -seeded cells. Flowers axillary.
790 . Ophiopogon. Flower half superior, persistent. Anthers sessile. Stigma simple. Berry 1-seeded.
789. Eucomis. Flower 6-parted, persistent, spreading. Filaments united at base into a circle. Capsule 3-celled. Seeds ovate. Scape with a leafy crown.
790. Brodica, Flower campanulate, 6-parted. Filaments inserted into the chroat. Ovary stalked. Capsule 3-celled, with many-seeded cells.
791. Peliosanthes. Flower rotate, 6-parted ; sepals vaulted at base. Ovary 3-celled, with 2-seeded cells.
792. Aphyllanthes. Spathe glumaceous, imbricated. Flower 6-parted, with a spreading limb. Capsule 3-celled, 3-valved, many-seeded.
793. Sowerbaa. Sepals 6. Filaments 3, each bearing two anthers, with three sterile filaments between them.
794. Allium. Flower 6-parted, spreading. Spathe many-flowered. Umbel clustered.
795. Albuca. Sepals f: the imner conniving; the outer spreading, generally with a green stripe at their back. Style 3-comered. Seeds flat.
796. Xanthorrhea. Sepals 6, persistent. Filaments flat, naked. Caps. 3-cornered, Seeds two, compressed, edged.
797. Thysanotus. Flower 6-parted, spreading, persistent; with the inner segments fringed. Stamens 6 -declinate. Filaments smooth. Ovary with two seeded cells. Seeds 2, one erect, one pendulous.
798. Eriospermum. Sepals 6, campanukate, persistent. Filaments dilated at base. Caps. 3-celled Seeds enveloped in wool.
799. Gagea. Stamens adhering to base of sepals. Style clavate. Caps. 3-celled, 3-valved, covered by the remains of flower. Seeds small, numerous, round.
800. Ornithogalum. Sepals 6, erect, persistent, spreading above the middle. Filaments dilated at base, or subulate. Caps, roundish, angular, 3-celled. Seeds roundish, naked. Flowers white or green.
801. Scilla. Sepals 6, spreading, deciduous. Filaments filiform, attached to base of sepals. Flowers blue or pink.
802. Puschkinia. Flowor 6-parted. Cup very short, 6-toothed, covering the throat. Stamens within the cup.
803. Massonict. Limb of flower 6-parted. Filaments attached to the neck of the tube. Capsule 3-celled, 3-winged, many-seeded.
804. Eremurus. Sepals 6, after flowering, rolled together. Stamens naked, rolled together inside the flower, barren, much exserted. Style after fecundation reflexed.
805. Bulbine. Sepals 6, spreading. Filaments smooth. Caps. ovate. Seeds angular. Leaves flat. Flowers generally white or purple.
806. Asphodelus, Flower 6-parted, spreading. Six valves covering the ovary.
807. Anthericum. Sepals 6, spreading. Filaments bearded. Caps, ovate. Seeds angular. Leaves succulent, fistular. Flowers yellow.
808. Arthropodium. Sepals 6, spreading: the three inner wavy at the edge or fringed. Filaments bearded. Capsule nearly round.
809. Chlorophytum. Flower 6-parted, spreading, equal, persistent. Stamens 6. Filaments filiform, smooth. Ovary with many-seeded cells. Style filiform. Stigma 1. Capsule deeply 3-lobed, with compressed veiny lobes; three-celled, 3-valved. Seeds few, compressed.
810. Casia. Flower 6-parted, spreading, equal, deciduous. Stamens 6. Filaments beardless, narrowe: at each end. Anthers inserted by an emarginate base. Ovary S-celled, with 2-seeded cells. Style filiform. Capsule lobed, or clavate at end. Seeds ventricose.
811. Narthecium. Sepals 6, spreading, persistent. Filaments filiform, hairy. Caps. prismatical. Seeds with an appendage at each end.
812. Dianella. Sepals 6, spreading. Filaments thickened at end. Berry 3-celled, many-seeded.
813. Eustrephus. Flower 6-parted, the 3 imner sepals fringed. Capsule berried, 3-celled, 3 -valved, manyseeded.
814. Asparagus. Flower 6-parted erect; the 3 lower sepals reflexed at end. Berry 3-celled, many-seeded.
815. Drimia. Flower campanulate, 6-cleft, with revolute segments. Stamens inserted into the sepals.

Stigma capitate.
818. Uropetalon. Flower six-cleft, with the alternate segments shortest. Capsule membranous. Seeds black, shining.
819. Hyacinthus. Flower erect, 6-cleft, with equal segments. Stamens inserted in the middle of the flower. Cells of capsule 2-seeded.
820. Zuccagnia. Sepals cylindrical : the 3 outer longest, lanceolate, setaceous, reflexed. The other characters of Hyacinthus.
821. Muscari. Flowers ovate or cylindrical, very shortly divided, The other characters of Hyacinthus.
822. Lachenalia. Sepals 6, obtuse, the 3 inner the longest. Stamens erect. Capsule 3-winged. Seeds globose.
823. Phormixm. Sepals 6, the 3 inner the longest. Stamens ascending, exserted. Capsule oblong, 3-cornered. Seeds compressed.
824, Cyanella. Sepals 5 : the 3 lower hanging down. Style and lowest stamen declinate. Capsule roundish, S-celled.

## 3. Dicotyledons.

825. Leontice. Cal. 6-leaved, deciduous. Petals 6. Six leaves inserted upon the claws of the corolla, spreading at end.
826. Caulophyllum. Cal. 6-leaved. Petals 6, opposite the calyx. Cells of anther opening at edge.
827. Diphylleia. Cal. 3-leaved, deciduous. Petals 6, opposite the calyx. Anthers opening with a membrane dividing from the base to the tip. Berry 1-celled. Seeds 2-3, roundish.
828. Frinos. Cal. 6-cleft. Cor, monopetalous, rotate. Berry 6-seeded.
829. Berberis. Cal. 5-leaved. Petals 6, with glands upon their claws. Style O. Stigma umbilicate. Berry 1 celled, 2-4-seeded.
830. Nandina. Cal. many-leaved, imbricated. Petals 6. Berry juiceless, 2 -seeded.
831. Cossignia. Cal. 5-parted, Petals 4 or 5. Capsule 3-celled, opening at end with about 3-seeded cells. Flowers in panicled racemes.
832. Hillia. Cal. double, the lower 6-leaved, the upper superior, 2 or 4-leaved. Cor. 6 -cleft, with a very long cylindrical tude. Anthers sessile, in the throat of the corolla. Seeds comose.
833. Richardia. Cal. 6-parted, persistent, superior. Cor. funnel-form, 6-cleft. Stigmas 3, capitate. Fruit 3-partible. Seeds 5 , truncate.
834. Canarina. Cal. 6-leaved, Cor. 6-c eft, campanulate. Stigmas 6. Capsule inferior, 6-celled, manyseeded.
835. Frankenia. Cal, 5-cleft, funnel-shaped. Petals 5. Stigma 2-3-parted. Caps. 1-celled, 3-valved.
836. Peplis. Cal. carapanulate, with a 12-cleft mouth. Petals 6 or 0 , inserted in the calyx. Caps. 2-celled, many-seeded.

Order 2. DIGYNIA.

6 Stamens. 2 Styles.
837. Oryza. Giumes 2, 1-flowered. Paleæ2, nearly equal, adhering to the seed.
838. Atraphaxis. Cal. 2-leaved. Petals 2, sinuated. Stigmas capitate. Seed 1.

Order 3. TRIGYNIA. 5if 6 Stamens. 3 Styles.

## 1. Monocotyledons.

839. Flagellaria. Sepals 5. Berry 3-1-seeded.
840. Scheuchzeria. Sepals 6. Anthers linear. Stigmas sessile, lateral. Capsules inflated, distinct, 2 -seeded. 841. Triglochin. Sepals 6, the 3 outer in a different row from the inner. Style $O$. Capsule opening by the base.
841. Lichtensteinia. Sepals 6, withering, persistent, wavy, spreading. Stamens hypogynous, shorter than the sepals. Capsule many-seeded, halr 3-valved.
842. Myrsiphyllum. Flower 6-parted, revolute. Styles 3, contiguous, straight. Ovary stalked. Berry 3-celled, with 2-seeded cells.
843. Tofieldia. Bracteæ3. Sepals 6. Capsules 3, superior, united at the base, many-seeded.
844. Melanthium. Polygamous. Flower rotate, 6-parted, with 2 glands at the base of each segment. Filaments from the elongated claws of flower. Capsule 3-fid, 3-celled. Seeds membranous.
845. Medeola. Flower 6-parted, revolute. Berry 3-seeded.
846. Xerophyllum. Flower 6-parted. Stigmas 3, oblong, sessile. Caps. 3-celled, with 2-seeded cells.
847. Wurmbea. Flower 6-parted, with an hexangular tube. Filaments inserted in the throat. Styles conniving. Caps. oblong, 3-cornered. Seeds round.
848. Androcymbium. Sepals 6, unguiculate, cucullate. Stamens inserted in the middle of sepals. Ovaries 3. Styles filiform.
849. Trillium. Cal, spreading, 3-leaved. Petals 3. Berry 3-celled.
850. Colchicum. A spatha. Flower 6-parted, with a tube proceeding directly from the root. Anthers incumbent. Caps. 3 , connected, inflated.
851. Helonias. Sepals 6. Styles 2, distinct. Capsule 3-celled, 3-horned, few-seeded.
852. Nolinea. Flower 6-parted, spreading. Style very short. Capsule 3-cornered, membranous, 3-celled, opening by bipartible dissepiments. Seeds solitary, convex on one side.
853. Aponogeton. An amentum composed of scales. Neither calyx nor corolla. Capsules 4, 3-seeded. Stamens varying from 6 to 7 and 12.
854. Sabal. Spathes partial. Filaments free, thickened at base. Berry 1-3-seeded. Secd bony. Embryo lateral. A palm.
855. Dicotyledons.
856. Rumex. Calyx 3-leaved. Petals 3, conniving. Seed 1, 3-cornered.
857. Oxyria. Calyx 2-leaved. Petals 2. Styles 2.

## Order 4. POLYGYNiAA. $\frac{\operatorname{cis}^{8} \theta^{8}}{8} 6$ Stamens. Many Styles.

858. Wendlandia. Sepals 6. Petals 6, succulent. Style reclinate. Caps. 6, 1-celled, many-sceded.
859. Damasonium. Spathe 1-leaved, half-bifid, winged. Flowers superior, 6 -parted, with the 3 inner segments petaloid. Stamens 6-12. Ovary with 6-8-parietal prominent placentas, Style short. Stigmas 6-12.
860. Actinocarpus. Flower 6-parted: the 3 outer sepals falling off late, the inner petaloid. Stamens 6. Ovaries 6-8, connate at base, 2-seeded. Capsules connate at base, stellate above.
861. Alisma. Flower 6-parted : the 3 outer sepals falling off łate, like a calyx; the 3 inner petaloid. Stamens 6. Ovaries indefinite in number, 1 -seeded. Capsules distinct, not opening.

## History, Use, Propagation, Culture,

711. Narcissus. From vagzo, stupor, on account of the dangerous effects produced by the smell, even of the least perfumed kinds, upon the nerves. For this reason Naxcissus was consecrated to the Furies, who by means of it wcre accustomed to stuvify those whom they wished to punish. Jonquilla, a name applied to one

MONOGYN1A.
3997 Segm. refl. imbr. at base, Cup expanded fat, Three anthers shorter than the tube, Leaves erect narrow 3998 Lvs. 会 an inch broad glauc. at end rec. Seg. imbr, Cup plait, with scarlet rim, Stig. as long as inner stamens 3999 Lvs. erect glauc. Seg. imbric, with,deflexed edges, Cup yel. minutely plaited, Stig. as long as inner stamens 4000 Seg. horizontal obo. not imbric. Cup saucer-shaped with very red edge, Lower anth. half included in tube 4001 Scape kneed before flowering usually 2-3-flowered, Cup all yellow
4002 Very slender, Spathe 1-2-fl. Seg. white, Cup yellow cup-shaped 3 or 4 times as long as segm.
4003 About 3 -flowered, Seg reflexed white, Cup spreading plaited crenulate yellow
4004 Like N. Tazetta, differing in the 3-lobate cup, and in the edges of the upper leaves not being turned up 4005 Flowers about 16 , Seg round-oval reflexed incurved white, Cup large straight yellow entire
4006 Segm. white almost twice as long as the straight inflated nearly entire yellow cup
4007 2-3-fl. Cup very large thick truncate entire waxen twice as short as white segm.
4008 Spathe many-flowered, Cup camp. truncate shorter than petals, Leaves flat
4009 Spathe 1-2-f. Scape compr. 2-edged, Sepals spread. imbricated a little Jonger than truncated entire cup
4010 About 10 -f. Seg. white round ov, thrice as long as pale yel. spread. irreg. cut cup, Scape striat. rounded 4011 Few-flowered, Seg. stellate as long as tube, Cup cupulate crenate, Style within the crown
4012 Many-fowered, Cor. bent back, Segm. stellate, Cup spreading cupulate slightly trifid
4013 About 6-f. Seg. round-ovate imbr. white, Cup citron spreading entire or lobed, Scape rounded below
4014 Many-fl. Pedunc. nearly erect, Seg. imbr. 3 times as long as the erect eroded cup, Lvs. remarkably broad 4015 Scape obtusely compressed smooth, Segm. very yellow ovate imbr, 3-4-times as long as cup
4016 Like the last, but the cup is more entire and the leaves broader
4017 Spathe l-3-flowered, Seg. reflexed spatulate, Cup much shorter than seg. saucer-shaped spreading crenate
40181218 inches high, Lvs. linear subulate chann. Scape rounded L-2-f. Ovary inflated, Fl. sulphur-colored 4019 Leafless at flowering, Flowers green with acute segm.
4020 Spathe 1 -flowered, Cup 6 -parted very short, Leaves subulate
4021 About 3-flow. Cup obsoletely curled outside obtusely angular not twice as short as seg. Scape $1 \frac{1}{3} \mathrm{ft}$. high 4022 Segm. of starry cor. distinct at base, Cup even distinctly 6 -lobed
4023 About 2-fl. Seg. refl. pale yellow, twice as long as cup which is deeper col. trun. cylind. Style exserted 4024 A slight variety of N. incomparabilis
4005 1-7.f. Leaves erect, Segm. reflexed lanceolate longer than cup which is cyathiform 6 -fid repand 4026 All white, Cup twice as short as segm. which are reflexed
4027 A very obscure plant of which no description is anywhere given
4028 Cor. pendulous white with straight half-expanded segm. Cup cyathiform with a crenulate mouth 4029 Segm. twisted stellate, Cup cyathiform much plaited twice as short as segm.
4030 Sulphur-colored or nearly white, Cup turgid entire as long as segm. Style protruded, Leaves obtuse 4031 Flower yellow, Crown turgid truncate entire, Style included, Leaves erect before flowering 4032 FL yel. Crown inflated at the end contracted entire, Style exserted, Lvs, always spreading on the ground 4033 Crown undulate lobed at end, Style included
4034 Crown deeply 6-lobed, Style very long, Leaves shining erect before flowering
4035 Segm. sulphur, Crown campanulate ycllow at the end spreading 6 -lobed, Lobes inbricated
4036 Leaves flat and scape striated, Segm. much twisted shorter than crown, Germ. 6-furrowed 4037 Lenves twisted, Scapes and germens smooth, Segm. twisted the length of crown

ard Miscellaneous Particulars.
of the species, is a diminution of juncus, a rush; as Tazzetta'is of tazza, the Italian name for a cup. This is a popular flower of great beauty, some species very fragrant, and all of them of the easiest culture. They also force well, either in pots of earth or on glasses of water. Their forcing may be greatly accelerated by retard.

History, Use, Propagation, Culture, ing the bulbs one season in an ice-house. Many fine bulbs of this gound that city in great beauty. The genus and some from Naples, especially the italicus, which grow however no one has followed.
has been injudiciously separated into several by Haworth, whom ho Scilla. The word signifies all-force, from
712. Pancratium. A name given by the Greeks to a kind. This is a free-flowering genus; several of the $\alpha y$ and rearos, in allusion to its powerful effects in medicine. species are very handsome and ragrant, and are best, and carc must be taken not to give them much water, light loam and rich vegetable mould suitsthem best, when they are not in a growing state. Seart, if it be kept dry, it will throw out abundance of suckian, which freely. If any plant happen to lose it it. (Bot. Cult. 89.) $\mathbb{P}$, maritimum, illyricum, and carolinianum, are is the readiest way of propagating it. (Bot. Cult. 89.) . has yellow flowers, and is not less beautiful than rare.

4038 Scape striated compressed, Segm. flat: the outer ovate acuminate not so long as the serrated crown 4039 Scape smooth compressed, Crown very yellow deeply 6-cleft spreading, Segm. $\frac{1}{2}$ erect lanceolate 4040 Scape two-edged straight striated, Segm. sulphur, Crown yellow with serrate crenate orifice 4041 Segm, incurved horizontal a little twisted, Crown funnel-shaped ventricose at base very short 4042 Like the last, but the crown is yellow, the segm. of flower yellowish
4043 Spathe 1-fl. Scape 2-edged, Cup columnar plaited shorter than the sepals, Tube about as long as sepals 4044 Scape 2 -edge nearly trian. Spat. 1-2-fl. Seg. of cor. lanc. acute, Crown plaited crenate thrice as long as limb 4045 Segm . half as long as tube ovate, Crown funnel-form 6-cleft plaited upwards
4046 Leaves twisted very glaucous, Crown campanulate very large very open at orifice
4047 Segm . $\frac{1}{2}$ erect twisted incurved spreading, Crown as long as segm, deeply and irregularly cut
4048 Scape deeply striated, Seg. much spread. twisted ellipt. shorter than crown which has a very open orifice 4049 Scape deeply striated, Mouth of crown 6 -cleft expanded deeply and irregularly crenate
4050 Pet. narrow obcuneate not imbricating at base, Crown 6-cleft at mouth spreading minutely rugose 4051 Spathe l-flowered, Crown curled waved lobed, Scape 6 inches high

4052 One-flowered, Leaves lig. lanc. Segments of limb longer than tube, Stamens incurved conniving 4053 Spathe 2-4-f. Lvs. lin. acute, Limb of cor. shorter than tube, Altern. div. of crown deeper, Stam. incurved 4054 Many-f. Lvs. sheath. downw. very glauc. with an obt. point, Cr. much unit. to turb.limb, Anth. bent inw. 4055 Many-flowered, Leaves neither glaucous? nor sheathing downwards, Anthers incumbent
4056 Many-fl. Lvs. strap-shap. somew. glauc. obt. Tube twice as short as limb, Fil. not longer than teeth of cr. 4057 Many-fl. Lvs. strap-shap. coes. Scape 2-edged, Pet, lanc. conv. longer: than tube, Cr. short with very deep div 4058 Many-f, Leaves bright-green, Tube as long as stellate nodding limb, Stamens short abruptly bent inwards 40591 or many-fl. Spat. herb. Limb erect turb. a little shorter than blunt, 3-cor. tube, Cro, not much shorter than 4060 Few-flowered, Leaves obt. Spathe dry, Cor. nodding, Anthers longer than filaments [limb 4061 Lvs. stalked ellip. shortly pointed, Scape compressed, Petals linear wavy, Racemes of crown 1-toothed 4062 Many-flowered, Leaves many lorate narrowed each way, Tube rounded twice as long as limb 4063 Leaves lanc. lorate, Petals little shorter than tube, 5 times as long as crown
4064 Many-f. Lvs, lorate with long points shin, Petals spread, longer than tube 3 times as short as nar. crown 4065 Two or many-flowered, Leaves linear-lorate obtuse many, Crown turbinate rotate longer than filaments 4066 Two-flowered, Lovs. few linear-lanceolate with long points, Crown rotate turbinate longer than filaments 4067 Many-flowered, Leaves oval-oblong stalked, Spathe 4 -valved, Cup narrow 4 times as short as the limb 4068 Lvs. broad-lin. Flowers many sessile with linear straightish segments longer than tube, Crown obconical 4069 Leaves lanceolate dark-green, Flowers a foot long, Stamens short
4070 A slight variety of P. amænum, No. 4073
4071 One or 3-f. Leaves linear cuneate, Tube as long as lin. petals, Seg. of crown eroded, Fil. length of crown 4072 Many-fi. Lvs, many lin. lanc. Tube twice as short as limb, Cr. twice as short as stam. with 1-tooth. recesses 4073 Lvs. many oval-lanc. 3 or 4 times as broad as stalk, Umbel sessile spreading, Tube shorter than limb 4074 Compactly many-fi. Lvs, oval stri. nar. each way, Tube round, nearly as long as limb, Teeth of crown entire 4075 Lvs, many lanc, elliptical with a point three times as broad as their stalk, Tube twice as short as limb

## 4076 The only species

4077 Leaves stalked cordate rounded with concentric distant nerves
4078 Like the last, but is smaller with a 6 -parted crown

4079 Flowers yellow
4080 Flowers purple

## 4081 A small plant with bright yellow flowers appearing before the leaves

4082 Leaves linear ligulate, Flowers 6-7-cylindrical, with oblong obtuse segments 4083 Leaves oblong lanceolate stalked, Flowers 2 campanulate funnel-shaped

## and Miscellaneous Particulars.

713. Eucrosia. From $\varepsilon \nu$, well, and xgooros, a fringe, in allusion, we presume, to the beautiful fringe to the fower, formed by the cup of united stamens. A pretty half-nardy bulbous plant, extremely rare.
714. Eurycles. From छvgus, wide, and $\varepsilon \lambda \propto \sigma \mu \infty$, a portion of a thing, in allusion to the broad divisions of the crown. A genus formerly included in Pancratium, from which it is distinguished not only by its flowers, but sy its broad leaves, which are like those of the Hemerocallis.
715. Calostemma. From $x \propto \lambda о 5$, beautiful, and $5 \varepsilon \mu \mu \varkappa$, a crown, in allusion to the beauty of the colored corona of the flower. Very pretty New Holland bulbs, requiring the cultivation of other greenhouse bulbs.
716. Chlidanthus. From $\chi$ sosios, delicate, and $\alpha y, 4 \circ 5$, a flower; on account of the declicate color and texture of the beautiful yellow flowers. The plant requires a stove, and produces the scape before the leaves.
717. Chrysiphiala. So named by Mr. Ker, in allusion to the golden cup-like flowers; xguoos, gold, and $\phi \Delta \lambda \eta$, a goblet. Bulbous plants from the same country and with the same habits as the last.
718. LOPHI'OLA, B. M. Lophiola.

History, U'se, Propagation, Culture,
718. Lophiola. From $\lambda \circ \phi \alpha_{\text {, a }}$ a crest, on account of the little crest of the petals. It is a very rare North American plant, and thrives best in pots set in saucers of water.
719. Argolasia. From eegos, white, and $\lambda \alpha \sigma s o s$, wool, on account of its calyx, which is white and velvety on the outside. It requires the same culture as the last.
720. Anigozanthus. Named by Labillardiere, from $\alpha y \sigma \chi \omega$, to raise up, and $\alpha y, 105$, a flower. Its flowers are raised upon very long conspicuous scapes. Curious New Holland plants, with yellow or green flowers.
721. Musa. So named by Plumier, in memory of Antonius Musa, the brother of Euphorbus, and the the freedman of Augustus. Such is the sense in which Linnæus admits the word. But the Arabic name for the plant, mauz, is a much more likely derivation. This splendid genus consists of species which have perennial, roundish, solid, watery bulks, with biennial, and sometimes longer enduring stems. The stems are straight, erect,varying from five to twenty-five feet in height, simple, thick, round, smooth, fungous, watery, and lamellated. The leaves are oblong, entire, from three to ten feet in length, and under two feet in width. The flowers are in large terminating racemes, without a calyx or perianthium, generally whitish: the fertile flowers occupying the lower, and the barren the upper, part of the raceme. The former are succeeded by oblong, angular, fleshy berries, sweet, eatable, and containing many black seeds. They are natives of the old world, and for the most part cultivated there: none appear to be natives of America.
M. paradisiaca rises with a soft herbaceous stalk fifteen or twenty feet high, with leaves often more than six feet long, and near two feet broad. When the plant is full grown, the spike of flowers appears from the centre of the leaves; it is near four feet in length, and nods on one side. The fruit which succeeds the fertile flowers on the lower part of the spike is eight or nine inches long, and above an inch in diameter, a little incurved, with three angles ; at first green, but when ripe of a pale yellow color. The skin is tough, and within is a soft pulp of a luscious sweet flavor. The spikes of fruit are often so large as to weigh upwards of forty pounds. Gerarde, and other old authors, name it Adam's apple, from a notion that it was the forbidgen fruit of Eden; whilst others supposed it to be the grapes brought out of the promised land by the spies of Moses. It is certainly one of the most useful fruits in the world, and seems to have migrated with mankind into all the climates in which it can be cultivated. The fruit is so much esteemed by all Europeans who settle in America, that the first thing they do in establishing a plantation is to begin with a Plantain waik; enlarging it as their family increases. Some or other of the trees are bearing most part of the year; and their fruit is often the whole food on which a family subsists. When used instead of bread, it is roasted or boiled when just full grown: it is also eaten boiled with salt-meat or fish, and when ripe it is made into tarts, sliced and fried with butter, or dried and preserved as a sweetmeat. A fermented liquor is made from them, and in some places a cloth from the fibres of the trunk; the leaves make excellent mats, or serve for stuffing mattrasses. Long (Jam. 788.) says, this fruit and the banana are among the greatest blessings bestowed by Providence upon the inhabitants of hot climates. Three dozen plantains are sufficient to serve one man for a week instead of bread, and will support him much better.
M. sapientum is by some considered a variety of the plantain, from which it differs in having its stalks marked with dark purple stripes and spots. The fruit is shorter and rounder, with a softer pulp, of a more luscious taste. An excellent marmalade, and a drink like the best Southnam cider, are made from it. There are many varieties both of the plantain and banana.
M. rosacea and coccinea, are very ormamental plants, on account of the color of the flowers, but scarcely to be distinguished from M, paradisiaca. The culture of all the species is easy in lofty bouses, with abundance

## 4084 The only species

4085 Leaves linear carinate smooth, Scape angular corymbose, Flowers woolly
4086 Stem and leaves smooth, Down of branches deciduous, Anthers with a reflexed end
4087 Spadix nodding, Male flowers persistent
4088 Stem spotted, Spadix nodding, Male flowers deciduous
4089 Spadix nodding or erect, Male flowers deciduous, Spathes elliptical obtuse, Fruit oblong
4090 Spadix erect, Flowers capitate, Spathes clustered scarlet very large yellow at end

## 4091 A plant like a Banana

4092 Leaves multifarious cæspitose recurved very narrow and rigid
4093 Lvs. Iorate atten. erect recurved glaucous above chan. with marginal minute dense white serrulations 4094 Stemless, Lvs, toothed spiny, Scape branched, Tube of cor. contracted in middle, Stem longer than cor 4095 Leaves toothed spiny, Scape quite simple
4096 Leaves narrow lanceolate flaccid recurved, Spines marginal minute
4097 A little stemmed, Leaves toothed spiny, Scape branched, Stam, longer than cylind. cor.
4098 With a stem, Leaves narrow lanceolate glaucous tooth-serrated
4099 Leaves erect bright green with an entire brown edge
4100 Stemless, Leaves toothed, Scape branched, Tube of cor. narrowed in middle, Stem as long as cor.
4101 Stemless, Leaves cartilaginous sawed, Scape simple
4102 Leaves thready at edge, Flowers of spike approximating by pairs

and Miscellaneous Particulars.
of room for the roots, and a rich loamy soil kept rather moist. A plant of the banana was planted in the pit of a stove about 1811. "It was then about six feet high, with a single stem. In each succeeding year it has produced a bunch of fruit; and in 1819 two bunches; the first ripe in May, the other in August, having about four dozen of fruit on each bunch. The plant is now sixteen feet high, and measures three feet round at the bottom." (Hort. Trans, iv. 138.)
722. Urania. A name of one of the muses, unjustifiably applied to this genus by Schreber, in the room of that of Ravenala, which it bears in Madagascar. To grow this plant luxuriantly, a strong heat and a goor supply of water are required. Fresh imported seeds will grow freely.
723. Buonapartea. So named by the authors of the Flora Peruviana, after Napoleon Bonaparte, emperor of the French. Fine plants like Bromelia, with long, narrow, recurved leaves, and spikes of simple blue flowers, which were never yet seen in this country.
724. Agave. Altered from ayavas, admirable, which this genus may well be said to be, considering its appearance, its size, and the beauty of its flowers. In mythology, Agave is the name of one of the Nereids A. americana is a popular succulent throughout Europe. It grows wild or is acclimated in Sicily, the south of Spain, and Italy, and is much used in the latter country, planted in vases as an ornament to piers, parapets, and about houses. About Milan and other towns in Lombardy, where it will not endure the winter, they use imitations of copper so well formed and painted, as to be readily mistaken for the original. In France and Germany it is still very common; and in this country formerly used to be the regular companion of the orange, myrtle, and pomegranate, then our principal greenhouse plants. An idea used to prevail that the American Aloe only flowered once in a hundred years; but, independently of this unnatural application of time to the inflorescence, it has long been known to flower sooner or later, according to the culture bestowed on it. Many have flowered within these few years in this country; and if the plant had the same treatment as the pine-apple, it would probably flower nearly as often. There is a variety with striped foliage, and sometimes the stripes are of different shades of white, yellow, and red, as in the queen pine-apple. There are hedges of the plant in Spain, Portugal, Sicily, Calabria, and the West Indies. According to Long, (Jamaica, iii. 710.) the leaves are useful as a succedaneum for soap. For this purpose, after being cut, they are passed between the rollers of a mill with their point foremost; and the juice being conducted into wide shatlow receivers, through a coarse cloth or strainer, it is exposed to a hot sun, until the aqueous part being exhaled, it is reduced to a thick consistence. It may then be made up into balls, with the help of ley ashes. It will lather with salt water as well as fresh. This soap may also be prepared by pounding the leaves in a wooden mortar, and then expressing the juice, which may be brought to a consistence by the sun or by boiling. One gallon of juice thus prepared, will yield about one pound of a soft extract. The juice, in both these ways, must be carefully strained; and the extract must never be combined with tallow or other unctuous materials. The leaves are also used for scowering pewter, and other kitchen utensils, and foors. The inward spongy substance of the decayed stalk is used for tinder. The fibres of the leaves, separated by bruising and stegping in water, and afterwards beating them, make a strong thread for common uses. All the species greatly resemble each other, and it is doubted, whether, in the works of several travellers, different species of Agave Aloe, and even Bromelia, are not confounded in their descriptions of their uses. There is, for example, a variety of the Agave americana, called Karatas by Long, and there is a species of Bromelia of that designation; hedges of Karatas are frequently mentioned without noticing the generic name of the plant.

History, Use, Propagation, Culture,
725. Furcraa. Named in honor of M. Fourcroy, the famous French chemist. A noble genus resembling the last.
726. Bromelia. So named by Linnæus, in memory of Olaus Bromel, a Swede, author of Lupulogia, and other works, 1694, \&c. Ananns, Fr., Ger., and Ital. and Nanas among the Peruvians, where it was origin. ally found by Europeans. This fruit may, without hesitation, be pronounced the first in the world, though it has not been known in Europe above two centuries, and has only been cultivated about a century as a fruit plant in Britain. It passed from Brazil to the West, and thence to the East Indies, where it has long been successfully cultivated. About the middle of the seventeenth century it was brought to Holland, by Mr. La Court, a merchant, and cultivated at Driehoek, his seat, near Leyden; and from thence it was imported into this country, and first fruited by Sir Matthew Decker, at Richmond, about 1715, or earlier. La Court began by growing his pines without bottom heat, as dry stove plants; but afterwards had recourse to low pits and tanner's bark. Plans of his pits, and an account of his mode of culture, are published in his work, entitled, Aenmerkingen over Lusthoven, Plantagion, \&c. (See Ency. of Gard, p. 1129, Anno. 1737.) Sir M. Decker, Bradley informs us, adopted pits; and soon after pine stoves, or larger and more commodious pits, were, by the year 1730 , in most of the first English gardens, and some also in Scotland, where the pine-apple was first fruited by Justice, at Crichton, near Edinburgk, in 1732. The pine is now cultivated very generally in Britain, in several places in Ireland, and at most of the capital cities on the continent. In one or two of the southern provinces of Spain, it is grown in sheltered situations in the open air.
There are many varieties of the pine in the West Indies, procured by raising from seed: in this country there are upwards of thirty sorts, but the queen, New Providence, and one or two others, are most esteemed The plants are propagated by suckers, and by that singular production, proceeding from the summit of the fruit, called a crown : from large suckers fruit is sometimes obtained in eighteen months, but, in general, a period of two or three years is required, and for the New Providence sometimes longer. Loamy soil well enriched with rotten dung, and the pots sufficiently drained, with abundance of heat without sudden extremes, will ensure large and well flavored fruit. (See The various Modes of cultivating the Pine-Apple from its first Introduction to the Improvements of Mr. Knight, \&c. 8vo. 1822.)

Some of the other species of true Bromelia have crowns, and the fruit of most of them is eatable, though small. B. Pinguin has the fruit separately in clusters, and not in a cone or pine, as in the Ananas. It is very common in Jamaica, in most of the Savannahs, and on the rocky hills. It is used there for fencing pas-

4103 Leaves entire, Scape branched
4104 Root tuberous, Leaves very long spiny at edge
4105 Cor. hexapetalous, Leaves ciliate spiny
4106 Leaves linear lanceolate entire upwards, at the base serrate spiny
4107 An obscure plant described by Haworth only and supposed to be Doryanthes excelsa ! I
4108 Leaves fringed with spines mucronate, Spike comose
4109 Leaves at the end toothed spiny, Spike comose
4110 Leaves entire, Spike comose
4111 Leaves ciliated spiny mucronate, Raceme terminal
4112 Leaves ciliated spiny with a very long point, Raceme term. comp Flowers sessile shorter than bractea
4113 Leaves ciliated spiny with a very long point, Raceme rigid compound, Flow, in numerous lateral spikes
4114 Leaves erect, Flowers stemless sessile aggregate
4115 Radical leaves toothed spiny : cauline entire
4116 Panicle lax few-fl. spreading, Peduncles 1-flowered, Upper spathes fertile as long as flower spreading 4117 Leaves serrate spiny, Bractes lanceolate toothed, Raceme compound shorter than leaves
4118 Leaves serrated spiny obtuse, Spikes alternate
4119 Leaves serrate spiny, Bractes ovate lanceolate, Scape elongated, Raceme compound
4120 Panicle diffuse, Leaves ciliate spiny mucronate recurved
4121 Raceme compound, Flowers heaped shorter than the long red entire bracteæ, Calyx acute
4122 Nearly stemless, Leaves aggregate sessile, Axillæ stoloniferous
4123 Leaves ligulate oblong very blue, Spike oval woolly with small sessile flowers
4124 Scape upright, Spike imbricated, The lower bracteæ green; the upper scarlet
4125 Leaves ciliate spiny, Peduncles and germens quite smooth
4126 Leaves ciliate spiny, Peduncles and germens downy
4127 Leaves narrow glaucous entire, Calyx villous
4128 Leaves entire somewhat spiny at base
4129 Leaves entire a little spiny at base, Bractes as long as peduncle and calyx 4130 Leaves entire white beneath, Raceme imbricated dense
4131 Leaves toothed spiny recurved, above shining smooth, beneath mealy
4132 Spike compound contracted, Leaves ensiform aculeate, Cor. with a black spot at bottom 4133 Leaves linear lanc. entire, Petals revolute, Stamens longer than cor.

4134 Culm panicled
4135 Leaves upwards serrate spiny, Spike comose

and Miscellaneous Particulars.
ture lands, on account of its prickly leaves. These, stripped of their pulp, soaked in water, and beaten with a wooden mallet, yield a strong thread which is twisted into ropes and whips, and manufactured by the Spaniards into a good cloth. The juice of the fruit in water makes a cooling draught in fevers; it is extremely diuretic, destroys worms, and makes a good vinegar.
B. Karatas, so called from its Brazilian name, Karaguata-acanga, generally grows at the root of some shady tree, in hilly and woody places in America and the Caribbee islands. It is an elegant plant, producing nume. rous radical leaves, which are of a subulate-linear shape, sharp pointed, and edged with spines. The flowers are scentless, seated in the bosom or middle part of the plant, rose colored, with the calyx and germ downy. The length of the leaves is six or seven feet. The fruits are oval, two or three hundred in number, and grow sessile in a heap or central group, surrounded by paleaceous expanded leaves or bractes; they contain a succulent whitish or yellowish fiesh, under a coriaceous and yellowish bark. When ripe, they are far from unpleasant; but when unripe they set the teeth on edge, and excoriate the mouth. The economy of this plant in the preservation of its fruit to maturity is wonderful : being so protected by the spines of the surrounding leaves, as to be secure from all injuries.
B. humilis propagates itself by runners or shooting processes, which proceed from the axillæ of the lower leaves, and produce a young plant from their extremities.

Bromelia fastuosa is the most beautiful of the genus. It has never flowered more than once in this country, when the figure in Mr. Lindley's Collectanea Botanica was obtained. Bromelia sylvestris resembles this, but is less beautiful.
727. Guxmannia. Named after Anastatio Guzman, an industrious apothecary, and zealous collector of objects of natural history in South America. A beautiful evergreen herbaceous plant, with the foliage of Tillandsia, and a spike of bracteæ, the uppermost of which are richly colored with rose.
728. Pitcairnia. So named by Mons. L'Heritier, in honor of William Pitcairn, M. D. an eminent physician of London, and a collector of foreign plants, particularly from the Alps. The species are remarkable for their long, narrow, green, prickly leaves, and for their uniform panicles of bright red. Pitcairnia staminea is very handsome. They require the same treatment as Bromelia.
729. Tillandsia. So named by Linnæus, in memory of Elias Tillandsius, professor of physic at Abo, authox

History, Use, Propagation, Culture,
of Flora Aboensis, 1673. Several species of this genus are parasitical, and others require the same treatment as Pitcairnia or Bromelia.
T. utriculata is a valuable plant in the woods of the West Indies, as containing a supply of water in dry seasons. The seed being pappose, is carried about by the wind, and sticks readily on the bark of trees: there, especially on decaying ones, it sends out small brown fibres which take hold of the bark, and weave and mat themselves among one another: from this foundation rise several leaves on every side, like those of Aloes or Ananas; they are folded or inclosed one within another, each three feet and a half long, and three inches broad at the base, but ending in a point, having a very hollow or concave inward side, and a round or convex outward one, forming a bason or cistern, containing about a quart of water, which, in the rainy season falls upon the upper parts of the spreading leaves, and being conveyed down them by channels, lodges in the bottom as in a bottle; for the leaves, having swelled out at the base, bend inwards close to the stalk, thus hindering the evaporation of the water by the heat of the sun. From the midst of the leaves rises a round, smooth, straight, green stalk, three or four feet high, having many branches, and when wounded yielding a clear white mucilaginous gum. The flowers come out here and there on the branches. The corolla is of a yellowish-white or herbaceous color; and the calyx is made up of three green viscid leaves with purple edges.
Men, birds, and insects supply themselves with water from this plant. Dampier says, he has many times, to his great relief, stuck his knife into the leaves just above the roots, and let out the water into his hat.
'T. usneoides deserves, for its appearance and uses, to be shortly described. The stem is no bigger than a thread; the skin whitish, as if covered with hoar-frost, within tough and black like a horse hair. Many of these together stick on the branches of the ebony or other trees superficially by the middle, and send down on each side some of the same stems, very often a yard long, hanging on both sides, curled, or turning and winding one within another, and resembling an old man's beard, whence its common name in Jamaica. The stems are branched, and the branches, which are two or three inches long, are set with roundish, white, frosted leaves. The flowers come out at the end of the branches. This slender parasitical plant is found among the trees in many parts of Jamaica, but does not grow so commonly there, nor so luxuriantly, as it does in the more northern pravinces of the main continent, where it is said to overrun whole forests. It is frequently imported from Jamaica to North America, for the use of the

4136 Leaves lanceolate channelled slightly prickly, outer acute inner retuse
4137 Filiform branched twisted rough
4138 Leaves lanceolate ligulate entire ventricose at base
4139 Leaves linear subulate entire imbricate, Spike lax
4140 Leaves narrow channelled recurved, Spike imbricated simple oval two-edged
4141 Spikes subdivided nodding, Flowers distinct ovate, Leaves ovate lanceolate membranous
4142 Leaves radical stiff frosted, Flowers imbricated in an ovate spike of whitish bractes
4143 Leqves subulate rough reclinate, Stems 1 -fiowered, Glumes 2 -flowered
4144 Flower tubular trfiid, Segments of the tripetaloid limb reflexed twice as short as tube, Lvs. entire
4145 Leaves cordate, Flowers spiked
4146 Leaves long-triangular narrowed by degrees, at the base truncate cordate, Petals lin. lanc.
4147 Leaves sagittate obtuse, Flowers in crowded umbels
4148 Leaves lanceolate elliptical cordate, Spike oblong
4149 Leaves linguiform flat smooth pressed on the ground 2ranked, Umbel shorter than the spathe
4150 Leaves linguiform oblong flat smooth callous at end, Umbel contracted shorter than spathe, Limb erect
4151 Leaves rounded fringed with pink hairs, Umbel few-flowered, Leaves of spathe cordate blunt
4152 Leaves oblong elliptical acute retuse wavy, Umbel contracted, Limb and stamens erect
4153 Leaves ellipt, lanceol. acute concave erect, Umbel longer than spatha, Limb spreading, Stam. ascending
4154 Leaves linguiform flat smooth fringed at edge depressed, Umbel contracted, Limb and stamens erect
4155 Leaves lanceolate ciliated villous above smooth beneath, Spathe campanulate 4-valved
4156 Leaves oblong lanceolatc hairy all over, Umbel fastigiate rounded, Limb and stamens erect
4157 Leaves broad much spotted with brown
4158 Lvs. ellipt. atten. at base depressed flat smooth ciliated at edge, Pedunc. longer than spathe and flower 4159 Leaves linear carinated
4160 Leaves linear lanceolate erect smooth, Peduncles length of spathe and flowers, Limb spreading
4161 Leaves 2 round ovate acuminate and scape hairy backwards, Spathe reflexed withered, Stam. included 4162 Leaves oblong obtuse smooth erect not spotted, Umbel rounded, Limb erect

4163 Leaves smooth
4164 Leaves plaited
4165 Spathe 1-flowered, Style clavate
4166 Spathe many-flowered, Style clavate
4167 A slight variety of the last
4168 Spathe many-flowered, Style filiform
4169 Vernal, Sepals entire, Style filiform with a blunt stigma

and Miscellaneous Particulars.
sadlers and coachmakers, who commonly stuff their pannels, cushions, \&c. with it. In Louisiana and the neighbouring settlements, this plant being very carefully gathered and stripped of the bark, is made inte matirasses, cushions, pannels, \&c. It is manufactured by tying the stalks in bunches, and sinking them in water, or burying them under ground in a moist place, until the bark rots : they are then taken up, boiled in water, and washed, until the fibres are quite cleared of the pulp. These are not only used instead of horsehair, but are so very like it, that a man cannot distinguish them, without a strict examination, and that even with a glass, unless he observes the branchings of it.
The Bonana bird's nest is always made of the fibres of this plant, and is generally found hanging by a few threads from the tops of the most expanded branches of the most lofty trees, especially those that spread over ponds or rivers.

In cultivating Tillandsia in our stoves, the parasitical species may either be hung up in baskets of moes, or fastened in moss to some plant, or to the stump of a tree set up on purpose: if planted in pots, they require but little water, and a sandy loam, with bits of sticks and small pieces of potsherds mixed with it. (Sweet.) They are, however, extremely difficult to manage under any mode of treatment.
730. Pontederia. So named in memory of Julius Pontedera, professor of botany at Padua, author of Tabulæ Botanicæ, $1718, \& c$. This is a genus of aquatic, herbaceous, perennial plants, with fibrous roots sheathing stem-leaves, and blue flowers in spikes or umbels from the cloven sheath of the leaves. A loamy soil in a cistern of water grows them well, and they are not without beauty.
731. Hamanthus. From $\alpha \& \mu \infty$, blood, and $\alpha y$ 身 $\circ 5$, a flower, in allusion to the brilliant red colors of the flowers. An ornamental genus, which thrives best in sandy loam and a little peat, and placed in a dry stove or bulb-house near the glass. The species require no water when in a dormant state, as the bulbs then ripen, and afterwards flower freely. (Sweet.)
732. Galanthus. From roe入 $\alpha$, milk, and $\alpha y$, $\circ \rho$, a flower, on account of the milky whiteness of the blossoms. It is rather singular, and also to be regretted, that no variations or hybrids have been produced from this early and pretty little fower.
733. Leucojum. From $\lambda_{\text {eveos, }}$ white, and iov, a violet. A genus resembling the last in habit, but differing in technical characters. The little autumn species is very pretty, but difficult to cultivate.
734. STRUMA'RIA, Jac. Strumaria

History, Use, Propagation, Culture,
734. Strumaria. From struma, a tubercle; a name given by Jacquin, on account of the swelling of the middle of the style. Pretty little delicate plants; their culture as in Hæmanthus.
735. Crinum. Kervor is Greek for a lily. Its limits as a genus are defined by the hypocrateriform fower with linear reflexed segments. Some unwise attempts have been made to destroy this distinction, by admitting into this genus plants with the characters of Amaryllis. We, however, have adhered to the old, and, as we think, most intelligible, mode of understanding the genus. This is a fine stately genus of the Amaryllideæ : several beautiful species have lately been introduced. They grow best in rich loam, mixed with a little rotten cung, and potted in large pots they will fiower abundantly. They may be increased by suckers from the root, or by seed. If the plant be shy in producing suckers, it may be cut down near to the root, and it will send out plenty. (Bot. Cult. 46.)

4170 Leaves linear ensiform rounded obtuse flat, Scape compressed, Stamens longer than cor.
4171 Leaves linear obliquely bent, Petals flat
4172 Leaves linear flat, Germen with three glands
4173 Leaves linear ensiform rounded obtuse flat, Scape rounded, Stamens as ang as cor.
4174 Leaves filiform, Petals acute
4175 Leaves filiform spiral, Petals acute colored outside
4176 Leaf filiform straight, Umb. many-flowered, Petals wavy flat
4177 Sepals spreading alternately bearded beneath the ends
4178 Scape flexuose much longer than the lanceol. ciliated leaves, Pedunc. very long, Petals wavy channelled
4179 Leaves striated, Umbel sessile many-flowered, Tube furrowed about as long as limb
4180 Lvs, lanc. lor. with cartil. teeth, Umb. subs, many-fl. Tube longer than limb, Stam. little long. than style 4181 Ends of sepals hooked inwards, Leaves linear channelled, Scape 4-ft.
4182 Bulb with a very long tap-root, Leaves stiff erect with long points smooth at edge, Umb. sess. many-f.
4183 Bulb spherical, Leaves narrow with a nearly smooth edge, Umb. few-fl. se 6 . Sep. lin. lanc. as long as tube 4184 Bulb oval not with a neck, Lvs. broad lin. lanc. straight with a white cartil. toothed edge, Umb. of fl. sess. 4185 Bulb round, Leaves narrowed lax channelled hispid at edge, Umb. sess. many-fl. Seg. shorter than tube 4186 Bulb ovate with a neck, Leaves broad subulate roughish at edge, Spathe herbaceous
4187 Bulb cylind, above ground, Lvs, lanc, smooth at edge longer than scape, Umb. stalk. Sep. long lin. reflexed
4188 Bulb very large with long red neck, Lvs. broad glauc. smth. at edge, Umb. many-fl. Tube shorter than limb 4189 Bulb with long neck, Lvs. obl. lanc. with obt. point smooth wavy at edge, Umb. many-fl. with pale bractes 4190 Bulb cylindrical scarcely with a neck, Leaves lorate with a smooth edge, Umb. on a very long stalk 4191 Bulb cylindrical like a leek, Scape central broad compressed, Umb. many-f. lax stalked
4192 Bulb ovate, Leaves scattered straight of one form
4193 Bulb cylindrical ovate, Leaves lorate very long, Umb. many-fl. stalked
4194 Bulb colum, above ground, Lvs. many lanc. with smooth edge, Scape as long as lvs. Umb. stalk. 20-30-fl.
4195 Bulb columnar, Leaves many bluntly acuminate, Flowers sessile, Segments longer than tube
4196 Like C. asiaticum, but with leaves strong plaited backwards about their middle
4197 Bulb oblong, Leaves acute wavy smooth at edge, Flowers many stalked declinate
4198 Bulb oblong ovate red, Leaves rough at edge, Flowers spreading, Sepals lanceolate flat not revolute 4199 Bulb round, Lvs. wavy rough at edge, Sepals ohov. flat, Flowers very large with a tinge of pink at back 4200 Bulb ovate, Leaves narrow channelled acute, Flowers upright crowded
4201 Bulb ovate, Leaves very long narrow green twisted, Flowers campanulate, Stamens spreading 4202 Bulb ovate, Leaves a little rough at edge, Umbel 5 -flowered shortly stalked, Sepals lanc. flat
4203 Leaves long narrow weak, Scape shorter than leaves, Umbel 5-6-flowered
4204 Leaves long narrow recurved rough at edge, Scape 2 -edged, Umb. 5 -flowered, Sepals broad
4205 Leaves linear channelled, Flowers cernuous, Tube cylindrical
4206 Leaves 3 linear glaucous, Pedunc, somewhat shorter than flower, Stamens included
4207 Many-flowered, Leaves 3 ligulaie spiral obtuse glaucous
4208 Leaves lanceolate obtuse flat oblique, Cor. pendulous obversely conical
4809 Leaf solitary linear glaucous, Limb as long as throat
4210 Flowers about 4 straightish nodding, Anthers included, Leaves linear not glaucous
4211 Leaves linear lanc. keeled appearing after the flowers, Cor, nodding, Limb as long as tube
4212 Lvs, strap-shaped erect spreading glaucous, Scape twice as long as the rays of the many-flowered umbel
4213 Leaves linguiform lying on the ground smooth
4214 Leaves lingulate pressed on the ground with a cartilaginous edge
4215 Leaves elliptical pressed on the ground rough with little pustules
4216 Leaves elliptical ovate erect edged
4217 Leaves falcate with a muricated discolored cartilaginous edge
4218 Umbel hemispherical close, Leaves many erect oblique glaucous
4219 Leaves strongly fringed with white hairs

and Miscellaneous Particulars.
736. Cyrthcothus. From xugros, cursed, and avios, a flower. The tube of the flower is long and round This is an elegant genus, and the species grow well in sandy loam mixed with a little peat. They require plenty of water when in a growing state, but scarcely any when dormant; and they should be fresh potted just before they begin to grow, when they will flower freely. They may be increased by offisets from the bulbs, or from seeds. (Bot. Cult. 176.)
737. Brunsvigia. Named after the noble family of Brunswick. This is a splendid genus; some of the bulbs grow to a great size, and require large pots to have them thrive and flower in perfection. They require plenty of water when in a growing state; but must wher dormant be kept so by wholly withholding water.

History, Use, Propagation, Culture,
738. Nerine. A fanciful name. Nerine was the daughter of Nereus. The plant has become naturalized in Guernsey, having been part of the cargo of a Cape ship, which was cast away many years ago on the coast of the island. N. sarniensis is a popular autumnal bulb, imported annually from the islands of Jersey and Guernsey, where it is grown in the open air in a sandy soil. Here it requires the protection of a frame to perfect the bulbs, so as it may flower the following year. The reason is, that the leaves on which the perfection and future flowering of every bulb depends, are protruded in the beginning of winter, and our winters are too long, gloomy, and severe, to admit of these leaves performing their functions properly. Hence two or more winters in a very mild situation in the open air are required to do what in Jersey is done in one winter; or two winters (as W. Williamson experienced) in a cold frame, or one winter only (agreeably to Knight's experience) in a frame with artificial heat. (Hort. Trans. iii, 450. iv. 177, and Caled. Mem. ii. 62.)

4220 Leaves narrow sub-involute glaucous falcate, Petals lin.-lanc. wavy, Stamens erect sub-exserted 4221 A mere variety of the foregoing, from which it differs in having crimson flowers
4222 Many-fl, Leaves many narrow sub-involute not glaucous upright
4223 Like the last, but the flowers are scarlet and appear at the same time as leaves
4224 Lvs, very narrow obt. min. pustulate, Sepals recurved divaricating: the one bearing the stamens remote 4225 Leaves few ligulate channelled, Sepals turned upwards oblique, Stam, declinate shorter than cor.
4226 Laxly many-f. Lvs. few lin. Cor. recurved stel. irregular, Sepals curled; the lowest placed under the stam
4227 Fl. stalked erect, Cor. infundibulif. clavate, Sepals linear lanceolate, Stamens straight, Leaves quite blue
4228 Five sepals, or all rising in a semicircular ray wavy, Stam. deflexed twice as long as cor.
4229 Leaves broad nerved lying on the ground, Sepals equally revolute, Stamens very long
4230 Leaves linear lorate, Scape flat smooth, Peduncles upright hispid 3-cornered twice as long as flower 4231 Leaves glaucous, Cor, deformed pale streaked with red

4232 Flower sessile, Leaf one linear, Sepals longer than tube ovate obl, reflexed acute, Stamens inclined 4233 One-flowered, Cor. regular erect turbinate conniving, One sepal pushed aside by the stamens 4234 Tube fringed, Cor nodding with a very ringent limb, Stam. included in the involute lower segments 4235 Tube crowned by a short entire green membrane
4236 Two-flowered half ringent, Membrane of the tube very short two-colored toothletted, Stamens included 4237 Mem . of orifice entire, Limb half ringent nodding with outer seg. incurved at end, the inner recurved 4238 Tube fringed, 2-3-fl. Stalks shorter than the erect spatha, Tube horizontal, Limb curved upwards

4239 Tube fringed, 2-4-fl. Lvs. few lorate acum. with a keeled rib, Cor. cernu. deeply turbin. Tube short thick 4240 Many-f. Tube fringed, Leaves 1 or more linear ligulate involute glaucous, Stalks as long as nodding cor.

4241 Flowers about 2 with a very long tube and a nearly regular limb
4242 Leaves long strap-shaped with the scape very cosious, Flowers 4 ringent with taper pointed segments
4243 Cor, funnel-shaped campanulate drooping, Stamens straight exserted, Leaves green lorate obtuse 4244 Umbel 6-fl. Sepals rolled into a cylindrical tube, Flower-stalks the length of flowers, Stigma simple 4245 Flower solitary erect, Sepals conniving, Stamens ascending, Anthers innate, Leaves linear fleshy 4246 Flower nodding ringent, Outer sepals broadest, Throat naked, Tube the length of the ovary 4247 Leaves several lorate-oblong narrow. towards the base, Flower cernuous cucull. tubular obliquely ringent

4248 Leaves linear very long and weak, Limb nodding 2-lipped, Flower-stalks many times longer than ovary 4249 Lvs. numerous spreading flat with rough edge, Fl. about 10 with nodd. spreading obsoletely 2-lipped limb
4250 Bulb spherical, Spathe bifid erect obtuse, Flowers sessile, Leaves with a long point wavy downwards 4251 Spathe withered scarcely as long as stalks, Cor. cern. uneq. Tube as long as germen, Upper sepal remote 4252 About 2-fl. Spathe arid refl. Limb turbin. bilabiate: three upper sep. conniv. recurv. lower narr. remote 4253 Leaves obl. lanc. not glaucous, Flowers nodding with an oblique mouth, the upper one much reflexed 4254 Lvs. many obl obtuse, Pedunc. divaricating as long as fl. Tube short turbin. Limb recurved spreading 4255 With many fl. on stalks, Lvs. ligul. Cor. regular turbin. nodd. Sepals recurv. at end, Tube scarcely any
4256 Cor. cucul. campanulate, Outer sepals separate to the bottom; inner united half way by the interior ribs
4257 Lvs, altern, turn, both ways fal. Scape flat, Cor, regul. Tube twice as short as revol. limb. Stam. erect spread. 4258 Umb. many-f. shortly stalked, Leaves attenuated glaucous, Tube about twice as long as limb
4259 Many-fl. Leaves acuminate glaucous, Flowers erect recurved stalked cucullate, Limb spreading revolute 4260 Leaves many lorate lanceolate wavy thick in the middle, Limb cernuous as long as tube
4261 Lvs. many lorate atten. channelled rough at edge, Limb obsoletely 2-lipped shorter than tube nodding 4262 Leaves obl. lanceolate narrowed both ways wavy rough at edge, Limb nodding shorter than tube 4263 Spathe many-f. Flowers stalked tubular at base, Leaves obl. lanceolate
4264 Spathe 2-fi. Cor. campan. deeply 6-parted, Upper seg. very narr. ; lower ob. acum. Lvs. lin. longer than scape
4265 The only species, Amaryllis purpurea of Willd

and Miscellaneous Particulars.
739. Amaryllis. Name of a nymph celebrated by the poets, and especially by Virgil. Derived from auxgvo $\omega$, to be resplendent. This is a superb genus : the greenhouse sorts thrive best in a rich loamy soil, and should have but little water given them after they have done flowering, so that the bulbs may harden, to produce more flowers the following season. Most of them are increased freely by offsets, and ripen plenty of seed. A shell taken from the bulb, with a leaf on it, and planted in a pot of mould, will produce a bulb; as will almost any bulbous-rooted plant. (Bot. Cult. 131.)
The stove Amaryllises grow best in light loam and rich soil, and the strong growing kinds require large pots to flower in perfection; they are increased by offiets and by seeds, which they bear plentifully, if care be taken to shake some pollen on the stigma at the proper period.
740. Vallota. A name of unknown meaning. The only species of this genus is a beautiful Cape plant, with bright purple flowers, of which two varieties are known in gardens

History, Use, Propagation, Culture,
741. Griffinia. Named by Mr. Ker, after William Griffin, Esq. of South Lambeth, an amiable man, and most assiduous and successful collector of bulbous plants. His collection is even now one of the finest in Europe. These species resemble Amaryllis, but have broad-stalked leaves, and blue flowers.
742. Sternbergia. Named after Count Caspar Sternberg, a celebrated botanist and patron of botany. The species consist of the hardy plants formerly referred to Amaryllis; they are all hardy, and, with the exception of S. lutea, very rare.
743. Zephyranthes. A fanciful name employed by Mr. Herbert. It seems to mean wind-flower. These are pretty plants, with solitary white or pink flowers. The species are so nearly hardy, as to survive in a warm border all but our severest winters.
744. Habranthus. From $\dot{\alpha} \mathcal{R}_{\rho} 05$, delicate, and ayNos, a flower. Small Chilian plants resembling the last in habit, and principally distinguished by their very unequal declinate stamens.
745. Doryanthes. So called by Correa de Serra, from $\delta o g u$, spear, and $\alpha y$, os, a flower, on account of the long straight stem, surmounted by a head of crimson flowers. This is a fine plant from New South Waies. It grows freely in a mixture of sandy loam and peat, but does not flower till it gets large: a conservatory is the most proper place for it, as the flower-stem grows to a great height before the flowers expand. It may be increased by suckers from the roots, but these are sparingly produced. (Bot. Cutt. 181.)
746. Gethyllis. From $\gamma \geqslant \rightarrow \in \omega$, to rejoice. The flowers are much valued at the Cape of Good Hope for the delicious perfume of their flowers. The species are very curious : but few have been introduced. Their bulbs require the usual attention as to not watering them when in a dormant state; they are increased by offisets or seeds.

4266 Leaves with a flat stalk, The three lower sepals wavy, Scape with a prominent line along each side
4267 Leaves oval-lanceol. with a stalk two-edged crosswise, Umbel remarkably stalked, Sepals uniform

## 4268 Leaves linear obliquely twisted shining

4969 Leaves lorate flat very glaucous laxly spiral
4270 Leaves many-keeled, Flower sessile on a two-edged scape, Sepals oval-oblong obtuse
4271 About 2-flowered, Leaf linear, Tube very short, Sepals rounded at end
4272 Leaves few linear, Spathe 1-leaved sheathing erect bifid twice as short as stalk
4273 Leaves many ligulate, Spathe bifid longer than stalk, Sepals acuminate
4274 Leaves lying flat on the ground shorter than the one-flowered scape, Spathe bifid fleshy at end *
4275 Leaves linear
4276 Leaves cylindrical
4277 The only species
4278 Leaves linear spiral smooth, Sepals ovate oblong
4279 Leaves linear spiral ciliated, Sepals ovate oblong
4280 Leaves linear filiform spiral villous, Sepals ovate oblong
4281 Leaves lanceolate flat, Sepals lanceolate

## 4282 Leaves linear lanceolate, Sepals oblong

4283 Leaves linear, Scape racemose, Sepals linear
4284 Stem erect, Cor. spreading, Three outer sepals wedge-shaped 3-toothed, Leaves lin. lanc. sessile 4285 Stem erect, Leaves spatulate oblong, Pedunc. longer than involucr. Cor. 2-labiate
4886 Stem twining, Cor. cylindrical in branched umbels
4287 Stem erect, Leaves linear lanceolate, Flower-stalks twisted, Outer sepals obcordate mucronate
4288 Stem weak, Leaves spatulate ciliated, Umbel many-flowered, Peduncles 2-flowered

## 4289 Flower campanulate spreading

4290 Hairy, Scape 4-fl. shorter than lin. lanc. leaves, Pedunc. twice as short as leaves
4291 Like the last, but the leaves are shorter more villous and incurved, Petals more obtuse
4292 Villous, Scape 4-fl. shorter than lin. lanc. Ivs. Pedunc. shorter than flower, Fruit cylindrical
4293 Pilose, Scape 2-fl. decumbent shorter than lin. lanc. leaves
4294 Scape 3-f. pilose as long as leaver, Pedunc. thrice as long as fi. Leaves lanc. smooth obliquely bent 4295 Leaves linear, Scapes umbelliferous or 1-f. Height depending on depth of water
4296 Scape 1 -flowered shorter than filiform rounded smooth leaves
4297 Leaves at the edge and keel hairy, Scape hispid many-flowered racemose, Sepals obtuse 4298 Leaves ovate-lanceolate entire smooth, Scapes 1-flowered
4299 Scape 1-flowered shorter than the lin. lanc. loose keeled smooth leaves

## and Miscellaneous Particulars.

747. Polianthes. From tolus, many, and ayy This is a very popular bulb, on account of its highly odoriferous flowers. It is imported annually from Italy and America, and flowers freely in pots of sandy loam and some rotten dung or leaf mould. R. A. Salisbury is of opinion that we might grow our own bulbs, by planting the offsets in such a situation as would obtain for them a "sufficient degree of heat in summer to bring their leaves out to their full magnitude, that of the roots following of course." "The theory," he adds, " ${ }^{6}$ which I would recommend any intelligent gardener to adopt in its general management is, to keep the roots growing as vigorously as possible from May to October, but in a state of complete rest and drought for the rest of the year." (Hort. Trans. i. 53.)
748. Alstromeria. So named from Baron Claudius Alstromer, of Sweden, who in his travels through Europe sent many plants to Linnzus. The species are beautiful, and A. Ligtu is as fragrant as mignionette. A. Salsilla is cultivated in Peru and the West Indies for its roots, which are used like the tubers of the potatoe.
A. Ligtu, Sweet observes, " is generally considered difficult to flower; but it will blossom well by letting the pots be dry for a considerable time till the shoots are all dried up; then give it a good watering, and put it in a moist heat, and it will flower abundantly. It may be increased by parting the roots or by seed." (Bot. Cuit. 15.) The finest kinds have not yet been introduced to this country.
749. Conanthera. From rovos, a cone, and \&y9nec, an anther; their anthers being, which is singular among these plants, united into a cone. A pretty little Peruvian genus, of which two species are now known.
750. Hypoxis. From Uxo, beneath, and ozus, pointed, in allusion to the sharp points of the inferior sepals. The species are plants with yellow flowers of little beauty, if we except H. stellata, which has a dark spot at the claws of its white petals. They increase fast by seeds or offsets.

History，Use，Propagation，Culture，
751．Curculigo．From Curculio，the weevil，one of the Coleopterous insects；the seed having a process resembling the rostrum or beak of that animal．The species are of the easiest culture and increase，but of little beauty．They in most respects resemble Hypoxis．
752．Bambusa．Latinized from the Indian name Bambos．B．arundinacea has a woody，hollow，round，straight culm，forty feet high and upwards，simple and shining；the internodes a foot in length and circumference； sheaths thick，hairy，rough，convolute，deciduous；branches alternate，slender，solid，spiny，reclining，springing out from the base to the very top；the lower ones being usually cut off．Panicle of flowers diffused in spikes
It grows naturally almost every where within the tropical regions．Over a great part of Asia it is very common；in China，Cochin－China，Tonquin，Cambodia，Japan，Ceylon，the peninsula of India，and the islands．It has been long introduced into the West Indies，and is said to flourish likewise in South Carolina．

There is，perhaps，scarcely any plant that serves for such a variety of domestic purposes．In the East Indies great use is made of it in building，and the houses of the meaner people are almost entirely composed of it．Dr． Patrick Brown mentions，that it was yet strong and perfect in some of the houses which had been built by the Spaniards in Jamaica above a hundred years before．Bridges also are made of it，masts for their boats，boxes， cups，baskets，mats，and a great variety of other utensils and furniture，both domestic and rural．Paper also if made from it，by bruising and steeping it in water，and thus forming it into a paste．It is the common fence for gardens and fields；and is frequently used as pipes for conveying water．The leaves are generally put round the chests of tea which are sent to Europe from China，as package，fastened together so as to form a kind of mat．The tops of the tender shoots are frequently pickled in the West Indies．

In the cavities or tubular parts of the bamboo is found at certain seasons a concrete white substance，called Tabasheer or Tabachir，an article which the Arabian physicians hold in high estimation．It is commonly found in what are called the female or large bamboos．The bamboos which contain this concrete are found on shaking to contain a fluid，which，after some time，gradually lessens，and then they are opened in order to extract the Tabasheer．The nature of this substance is very different from what might have been expected in the product of a vegetable．Its indestructibility by fire，its total resistance to acid，its uniting by fusion with alkalies in certain proportions into a white opaque mass，into a transparent permanent glass，and it being again separable from these compounds entirely unchanged by acids，8c．seem to afford the strongest reasons for considering it as very neariy identical with common siliceous earth．As to its medical virtues，though the drug be，as before observed，in much esteem with the orientalists，yet they are not such as to cause it to have any regard paid it in the modern practice of physic in Europe．
The bamboos grow rapidly to a great height in our stoves in moist loamy soil，and they are readily increased by suckers．
753．Calamus．From zaiceres，a reed，in Greek；qalem，in Arabic；calam，in Sclavonic ；calamus，and culmus，in Latin．This genus seems to form the connecting link between the palms and the gramineous plants，having the inflorescence of the former，and the habit of the latter．It furnishes the rattan canes，of which

## ana Miscellaneous Particulars.

there are several species or varieties, all distinguished by a stem which is perennial, unbranched, long, round, solid, jointed, scandent when near trees, but without prickles or tendrils, extremely tough and pliable. The diflerent sorts grow on the banks of rivers in the East, like our reeds, and furmish valuable props for plants, cables, ropes, withs, wicker and wattled work, baskets, hoops for petticoats, walking-sticks, \&c.
C. Zalacca, the Salxck, is cultivated for the fruit, which is about the size of a walnut, and covered with scales like those of a lizard; within the scales are two or three sweet yellow kernels. This tree is supposed to yield the dragon's blood.
754. Elerharta. So named by Linnæus, in honor of Frederick Ehrhart, a native of Switzerland, a very diligent and acute observer. These are very curious grasses, of which an account has been published in the Transactions of the Linnean Society.
755. Acorus. From $\alpha$, privative, and zogn, the pupil of the eye, maladies in which are supposed to be cured by the virtues of this plant. Acorus Calamus, Linnæus observes, is the only native aromatic plant of northern climates; the root powdered might supply the place of foreign spices. It has a strong aromatic smell, and a warm, pungent, bitterish taste. The flavor is greatly improved by drying. The roots are commonly imported from the Levant; but those of our own growth are full as good. The Turks candy them, and regard them as a preservative against contagion. In many counties of England, in which the plant abounds, it was formerly used to strew the floors of houses instead of rushes; a purpose for which its fragrant leaves made it very suitable.

The aromatic principle is an essential oil, which can be obtained by distillation. The root has been employed in medicine since the time of Hippocrates. By the moderns it is successfully used in intermittent fever even after bark has failed, and is certainly a very useful addition to Cinchona. It is also a useful adjunct to bitters, and stomachic infusions. Thomson says, (Mat. Med. 134.) it is too seldom prescribed. Though the plant is abundant in the fenny districts of England, yet what is used by the druggists is imported from the Levant. No cattle whatever eat the plant.
756. Urontium. The Greek name of a plant now unknown to us as such. It is thought to have been so called from growing on the edge of the Orontes, a river of Asia Minor. O. japonicum has broad leaves like those of the lily of the valley, green on the upper side, and covered with very minute hairs, so that they look like a fine velvet. Cattle, hogs, and stags, are very fond of these leaves in the spring, and they come out among the earliest. Kalm states, that the Indians gather the seeds and eat them when dried like peas, boiling them repeatedly in water before they are fit for use; they also boil them in milk or butter, and use them instead of bread. They call the plant Tawkee. It grows in marshes, near moist and low grounds, very plentifully in Virginia, Canada, and other provinces of North America.
757. Tupistra. A diminutive of тuzas, a mallet, on account of the peculiar form of the flower. An obscure plant, supposed to belong to the order Aroidea. It has long lanceolate broad leaves, and radical spikes of dingy purple flowers. It requires the heat of a bark-bed.
758. Tacca. The Malay name of the plant. T. pinnatifida has a red root, the size of a man's fist, roundish.

History, Use, Propagation, Cultare,
In its natural state it is one of the most bitter and acrid, but loses something of these qualities by culture. The raw root is rasped, and washed frequently in water, when a white meal falls to the bottom like starch; this is again washed twice or thrice, till no more acrimony can be perceived in the water. The meal is then dried in the sun. The first infusions are thrown away carefully, being looked upon as noxious and even deadly. In Otaheite and the other Society isles, they make of this meal a tasteful, nourishing, gelatinous cake-like salep. In Banda, where sago bread is not common, they use this as a succedaneum, and it is even preferable to the other. They also apply it as a plaster to deep wounds. The petioles and stalk boiled a long time lose their acrimony, and are rendered fit for food, as well as the roots, in China and Cochin-China.
759. Aspidistra. From $\alpha \sigma \pi / 5$, a little round shield, on account of the form of the flower. A plant with the same habit as Tupistra, but with solitary radical flowers half buried in the earth.
760. Juncus. From the Latin, jungo, to join : the first ropes were made of rushes. The Junceæ and Cyperacee form intermediate links between the Gramineer and the Liliaceæ; some of the latter, as Anthericum, bearing considerable resemblance to the Juncex.
J. acutus and maritimus are planted on the sea-embankments of Holland, and also in some parts of our own coasts, and in America. The roots run deep into the sand, and form a matted hody which holds it together. In Holland, when the plants are fully grown and in flower, they are cut down down, dried, and bound up like corn. The J. acutus, being very rough, is used for scouring copper and other vessels, and is one of the phants imported into this country for that purpose, under the name of the Dutch rush. The other species, and often both, are plaited into mats, baskets, chair-bottoms, ropes, \&c.
J. conglomeratus and effusus are used when green for making little baskets and children's orniments; and the pith of this and other species is used as wicks for watch-lights, and children's toys.
J. glaucus and conglomeratus are bad weeds in wet-bottomed clavey pastures. The best way of removing them is to dig them out, and to prevent their growth, to lay the land dry by surface and under-drainage. These species, and some others, are gathered green by the Dutch gardeners, and used when dry as tyes for fruit-trees. Sir J. F. Smith says, "they both, probably, served for strewing floors in England, as mentioned by Shakspeare and Sir Thomas More, about the time of Edward IV., and later; till more refined manners wrought

them into mats, and foreign commerce at length introduced carpets. For the former purpose, indeed, as well as for chair-bottoms and hassocks, Scirpus lacustris has superseded their use. (English Flora, p. 162.)
761. Luzula. These plants were called by the ancient botanists Gramen Luzula; ; whence this name has been contrived by Decandolle to distinguish the rushes with flat leaves, from those which have leaves resembling the stem.
762. Corypha. From zogupn, the summit of any thing; a name applied by Linnæus to this noble genus of palms, the topmost leaves of which form immense fans twenty feet long and fifteen wide. In Ceylon this palm is called Tallipot, and, according to Knox (Hist. of Ceylon.), it grows as big and tall as a ship's mast, and very straight. The leaves are of great use, one being so broad and large, that it will cover fifteen or twenty men. Being dried it is very strong and limber; and though it be very broad when open, yet it will fold close like a fan, and then is no bigger than a man's arm. The whole leaf spread is round, but is cut into triangular pieces for use : these they lay upon their heads as they travel, with the narrow end foremost, to make their way through thickets. Soldiers all carry them, not only to shade them from the sun, and to keep them dry in case of rain on their march, but to make their tents for them to lie under. These leaves all grow on the top of the tree. It bears no fruit until the last year of its life, and then yellow blossoms, most lovely to behold, but smelling very strongly, come out on the top, and spread abroad in great branches; these come to a fruit, round and very hard, as big as our largest cherries; in such abundance, that one tree will yield seed enough for a country; but not good to eat. The flowers smell so strong, that they ciat down the trees when they are near houses. The trunk within is a pith only, which they beat in a mortar to flour, and bake cakes of it, which taste much like white bread. The leaves also sєrve for covering their houses, and for writing on with an iron style. Most of the books which are shown in Europe for the Egyptian papyrus, are made from the leaves of this palm. In Malabar it is called Codda-pana. Rumphius, Loureiro, and Adanson mention several other species of this palm.
The C. taliera is a fine tree of prodigious use in the northern provinces of India for covering houses and for other useful purposes.

History, Use, Propagation, Culture,
763. Licuala. The Macassar name of this plant in the Moluccas. The fruit of this palm is a fleshy oval drupe, about the size of sweet-bay berries; it continues long green, but finally becomes brown or blackish: the nut is oblong, hard, and striated. In the Isle of Celebes, and in Macassar, they make much use of the narrow leaves for tobacco pipes, and of the middle broad one for wrapping up fruit, \&c. The wood, if the pith and hard rind may be so called, like that of most palms, is of little use.
764. Thrinax. From $\theta$ givec, a fan. The leaves of this little palm form a sort of fan. Brown (Hist. of Jamaica.) says, that this tree covers whole fields in many parts of Jamaica; that it grows both in the rocky hills and low moist plains near the sea, but seems to thrive best in the former. It shoots by a simple stalk, and rises generally from four or five, to ten or fourteen feet in height. It is aundance of small berries, which form of a fan, sustained by slender compressed foot-stalks, and bears a great abunda trunk seldom exceeds four serve to feed both the birds and beasts of the wood, when they are in seather buikings made in the sea; for it or five inches in diameter: it is much used for piles in wharf, and stalks of the leaves split and pared, serve stands the water well, and is never touched by the worms. The fores are required. The leaves are called to make baskets, bow-strings, ropos, \&c. where strength and toughness are required. Fears; but such coverings thatch, and are used as such, especiarmin
765. Tradescantia. So named by Ruppius, in memory of John Tradescant, gardener to Charles I. He in765. Tradescantia, So named by Ruppius, in memory of Jonn Tradescant, gated as one of the earliest ever
iroduced the first species to Europe. The museum of the Tradescants is celebrated

## 4359 Frond palmate, Segments linear toothed truncate at end, Stem spiny

4560 Fronds tlabelliform palmate plaited with stiff lanceolate segments, Stem compressed not prickly
4361 Erect, Leaves lanceolate smooth, Flowers umbelled clustered terminal
4362 Erect, Leaves grassy very long, Peduncles few-flowered, Cal. smooth
4363 Erect smooth branched, Leaves long recurved ciliated, Pedunc, lat, and term
4364 Leaves ovate at the edge and under woolly, Flowers umbelled clustered terminal
4365 Erect, Leaves ovate narrow at base smooth, Peduncle terminal naked bifid racemose
4366 Stemless smooth, Bractes equitant compressed, Leaves lanceolate colored beneath
4357 Erect smooth, Peduncles solitary very long
4.368 Stemless with rusty hairs, Leaves elliptical acuminate radical

4369 Creeping, Leaves ovate oblong: under the flowers cordate, Pedunc, umbelled axillary 4370 Procumbent hairy
4371 Creeping smooth, Spathes 2-leaved imbricated
4372 Erect, Leaves broad lanceolate, Pedunc. lateral solitary many-flowered, Bractes double
4373 Leaves oval lanceolate whole-colored, Racemes thyrsoid many-flowered
4374 Peduncles length of corolla, Leaves linear
4375 Peduncles twice as long as corolla, Leaves linear
4376 Bractes twice as short as flower-stalks, Leaves very narrow
4377 Bractes as long as flower-stalks : the inner much the shortest
4378 Leaves linear keeled, Three inter. petals wavy, Nerves of the petals undivided
4379 Leaves linear keeled, Petals flat acute, Nerves of the petals undivided
4380 Leaves linear keeled distichous, Sepals wavy acute spreading reffexed, Nerves branched 4381 Leaves linear keeled, Three inner petals obtuse wavy, Nerves of outer petals branched 4382 Leaves linear flat, Scape simple, Nerves of petals undivided

4383 Leaves cordate acuminate, Cor. funnel-shaped
4384 Leaves ovate acuminate, Limb of cor. campanulate
of 1 Flowers small. Cor. bilabiate. (ApIcra. И:)
4385 Leaves spreading ovate 3 cornered, Edge and keel with short subulate teeth
4386 Leaves spirally trifarious spreading blackish, on the outside smooth, Stem much twisted
4387 Nearly stemless, Leaves multifarious green not spotted : the upper horizontal rugose
4588 Leaves trifarious orbicular ovate acuminate green beneath very rough, Stem erect
4389 Leaves trifarious ovate acute very green not warted, Stems upright simple
4390 Leaves polished mucronate whitish, Edges and keel cartilaginous
4391 Leaves cymbiform obtuse glaucous very hollow above, Suckers numerous
4392 Leaves equilaterally triquetrous obtuse glaucous netted above concave
4393 Leaves subulate thick erect recurved concave above warted beneath, Edges obscurcly pearly
4394 Leaves 6 -farious at the end retuse deltoid pale-green lined above
4395 Leaves ciliate spiny 5 -farious deltoid cuspidate at the edge and keel ciliate spiny, Obsoletely netted below 4396 Proliferous, Leaves multifarious lanceolate rounded elegantly ciliated; at end with obl. pellucid spots

and Miscellaneous Particulars.
formed in this country : it was left to Ashmole, from whom it came to the university of Oxford, bearing his name. All the species are of the easiest culture, but few of them can be called beautiful. T. virginica is usually admitted as a border-flower.
766. Dichorizandra. A name contrived by Mikan, from $\delta 15$, two, xwet5, separately, and cevne, in botanical composition, a stamen ; to express the separation of two anthers, unon which the character of the genus depends. Beautiful herbaceous stove plants, with the foliage of Commelina or Tradescantia.
767. Agapanthus. From araisow, to love, and avito5, a flower; lovely-flower. The blossoms are of a bright agreeable blue color, and the plant itself much prized. It is nearly hardy, and cultivated without any trouble, in large pots of common earth.
768. Blandfordia. In compliment to George, Marquis of Blandford, son of the second Duke of Marlborough, a lover of plants, but not of honor. Beautiful New Holland liliaceous plants, very rarely seen in collections. Their flowers resemble those of Cyrtanthus.
769. Hemerocallis. From ÿpecc, the day, and zodos, beautiful : beautiful day-lily. This is an ornamental genus of the easiest culture. The species are remarkable among border flowers for their fine orange, yellow, or blue flowers. The Hemerocallis cærulea has been considered a distinct genus by Mr. Salisbury, and called Saussurea.
770. Aloe. A word for which several derivations have been offered. That it has been obtained from the Arabic álloèh, seems most probable. The genus has been divided by Mr. A. H. Haworth and others into

many genera, but their opinion has not been adopted by men of science. The species consist of odd looking succulents; some of them may be classed as trees, others as shrubs, but the greater number have more the babit and appearance of evergreen herbaceous plants. One or two species are used in medicine or the arts.
A. vulgaris purpurascens, soccotrina, and arborescens, which some consider as not specincally different

4397 Leaves very green, Spines marginal herbaceous, Tubercles numerous
4398 Leaves exparded lanceolate flat above, with the edges cartilaginous thick ciliated
4399 Leaves erect recurved subulate all over rough, Tubercles very minute numerous and pearly
4400 Leaves erect recurved subulate, Tubercles above large pearly below very minute
4401 Leaves spreading ovate acuminate with very numerous small warts
4402 Leaves long oblong acuminate with middle-sized pearly warts in rows
4403 Dichotomous, Leaves long ovate acuminate with great pearly warts, Capsules wrinkled across
4404 Stemless, Lvs, ovate acum. cuspidate upw. 3-cor. keeled, Edges and keeled cren. with coarse pearly warts
4405 Leaves rigid spirally 5 -farious ovate acuminate sparingly warted with dark-green tubercles
4406 Leaves spirally trifarious recurved at end covered all over with minute dark-green warts
4407 Lvs. multifarious cordate very hard deep-green twice keeled, with dark-green raised warts on under side
2. Flowers small. Cor, regular.

4408 Leaves very spiral 5 -farious ovate acum. smooth dark-green with some obscure spots beneath
4409 Leaves very spiral 5 -farious lanc. acumin. smooth pale-green with some obscure spots beneath
4410 Leaves 5 -farious and spiral smooth green obsoletely spotted beneath
4411 Erect rounded, Cor, rugose, Leaves multifarious erect polished not spotted
4412 Leaves multifarious very short and close together orbic, ovate horizontal polished bright-green
4413 Stemless dichotomous, Leaves dark-green erect ovate obl. acum, mucronate
4414 Leaves upright straight the old ones incurved ovate-obl, abruptly acuminate with small warts
4415 Soboliferous, Leaves spreading ovate acute with large warts
4416 Leaves erect lanc, acuminate above flat and smooth barred with large warts beneath
4417 Leaves semi-cylindrical 3-cornered thickened upwards very rough except at base
4418 Leaves attenuated erect with large white warts depressed in the centre
4419 Stem twisted, Leaves trifarious spiral imbricated spreading ovate acute smooth
4420 Leaves nearly trifarious densely imbricated spreading with an obtuse recurved point
4421 Leaves very rigid cordate stem-clasping thick dark-green ahove keeled and rough, Edge rough
4422 Leaves rigid rounded cordate closely inflexed dark-green edged a little rough above
4423 Leaves spirally trifarious blackish-green equilaterally triangular very rough
4424 Leaves close spirally trifarious blackish quite smooth outside, Stem much branched

> 8. Flowers curved. (Gasteria. How.)

4425 Differs from A. acinacifolia only in having blunter points to the leaves
4426 Leaves lorate lanceolate with a long bristly point keelea above at the edge fringed with memb. bristles
4427 Leaves spirally multifarious mottled narrow linguiform obtuse with a point
4428 Leaves tongue-shaped smooth pointed, Flowers racemose cernuous curved
4429 Differs from A. lingua only in having broader and shorter leaves
4430 Smooth, Lvs. multifarious acuminate spotted deeply keeled beneath with a cartilaginous edge and keel
4431 Stemless, Leaves acinaciform papillose
4432 Leaves distichous tongue-shaped acute spotted serrated with tubercles at edge
4433 Leaves distichous tongue-shaped retuse with a point obscurely spotted curved to one side
4444 Stemless, Leaves distichous acinaciform with cartilaginous prickly edges
4435 Leaves exactly distichous parabolically tongue-shaped short obtuse with edges smooth upwards
4436 Leaves bifarious ensiform bright-green
4437 Leaves ensiform acute papillose distichous
4438 Leaves spiral multifarious shining deeply keeled at the sides obscurely spotted, Edges cartilaginous
4439 Lvs. bright-green multifarious spreading with white warts obtuse with a point, Edges densely cartilaginous 4440 Leaves oblong acute entire above towards the end swollen pellucid with darker markings

## § 4. Flowers large. (Aloe.) <br> * Stemless.

4441 Leaves acuminate glaucous above flat smooth sparingly prickly beneath very rough
4442 Leaves acuminate above a little hollow very prickly all over
4443 Stemless, Leaves spiny ascending 3-cornered subulate
4444 Leaves distichous ensate lean smooth beneath white with warts running together
4445 Leaves oblong Janceolate green sparingly spotted, Edges with a few distant green spines
4446 Stem dichotomous, Leaves ensiform serrated, Stamens longer than cor.
4447 Stem shrubby simple, Lvs. revol. recurved narrow ensiform glauc. Warts prickly scatt. over both sides
4448 Leaves very green erect recurved, marginal and dorsal spines at the end red
4449 Leaves oblong lanceolate spiny toothed beneath white with warts, Petals unequal ** With a stem.
4450 Leaves spreading ascending spiny at edge, Pedunc. branched, Branches with a double bract
4451 Leaves ensiform glaucous recurved at end, Marginal serratures white
4452 Leaves oblong ensiform somewhat spotted, Edges cernuous white with straight spines
4453 Leaves stem-clasping reflexed spiny at edge
4454 Leaves ovate ensiform glaucous deffexed covered over especially beneath with scattered spines
4455 Leaves oblong ensiform glaucous incurved ahove smooth beneath covered with scattered prickly warts

and Miscellancous Particulars.
are cultivated in Barbadoes and other West India islands, to obtain the hepatic aloes, which are brought to England and used chiefly for horses. The aloes known by the name of Succotrine, is made chiefly from the species of that name, and A. spicata; being originally manufactured in the island of Zocotra or Socotora, in the straits of Babclmandel it retains the name. this drug is lighter colored, and not so coarse as the horse or

History, Use, Propagation, Culture,
hepatic aloes. A. spicata is cultivated extensively at the Cape of Good Hope, and a considerable part of what is sold as coming from Socotora is from that quarter. All the medicinal aloes are grown on the poorest soil. In preparing the drug, the leaves are cut off close to the stem, then cut in pieces, and the juice expressed; this is allowed to remain at rest for forty-eight hours, during which time a feculent matter is deposited; after which the supernatant liquor is poured off into flat dishes and evaporated in the sun. At the Cape, in the month of July, the leaves are pulled, then cut into pieces, the juice expressed, and inspissated by means of heat.

The month of March is the period for cutting the aloes in the island of Barbadoes. The leaves are cut off close to the stem, and disposed in tubs, in such a manner that the juice runs out. After a sufficient quantity of it is collected, it is exposed to heat in copper boilers; and as it becomes more inspissated by a constant and regular fire, it is ladled from one boiler to another, and fresh juice added, until that in the last, which is called the teache, acquires the consistence of honey; when it is poured into calabashes, and hardens by age. It is

4456 Suckers from the roct, Lvs. obl. acum. glauc. spread. cover. at side and back with very broad brown spines 44.7) Caulescent, Leaves ensiform toothed mottled spreading

4458 Leaves ovate lanc. pale-green with obl. obsolete whitish barred spots, Spines rufous
4459 Leaves obl, lanc, dull green rather glaucous with obl. large transverse spots and rufous spines
4160 Leaves spotted, Edges and keel serrulate at end
4461 Leaves thick spiny at edge below spinulose appressed not dotted, Racemes in umbels
4462 Leaves erect broadly ovate acute, Spines marginal numerous white
4463 Leaves erect spreading remote ovate acute, Spines marg. few large yellow
4464 Leaves ovate acum, green, Edge and keel very spiny, Spines long very white
4465 Leaves cæspitose very short glaucous 3-cornered at end, Angles with numerous white spines
4466 Distinguished from A. serra by the spines not being united at base
4467 Leaves acuminate above flat smooth beneath warted
4468 Leaves glaucous streaked, Edges obsoletely toothletted
4469 Leaves green lined, Spines red
4470 Leaves very glaucous, Spines red
4471 Leaves lorate ensiform downward spotted with white, Marginal spines middle-sized red
4472 Leaves broad ensiform recurved smooth hard, Spines marginal and dorsal red at end
4473 Leaves tongue-shaped smooth distichous, Flowers racemose pendulous cylindrical
4474 Leaves trifarious painted channelled, Angles cartilaginous
4475 Leaves ovate oblong attenuate spreading glaucous, The edge and keel upwards with white spines
4476 Caudex leafy, Leaves lorate ensiform channelled spreading green serrulate
4477 Glaucous polished, Leaves oblong acuminate with a deep white entire cartilaginous edge
4478 Leaves tufted with the spines of the edge united at base, Scape toothed
4479 Leaves smooth pale-green straight erect-spreading soft
4480 Leaves lorate lanceolate acuminate green, Edge red with many white teeth
4481 Stem shrubby, Leaves long-lanceolate recurved at end glaucous smooth spotted with red spines
4482 Lvs. narrow sword-shaped beneath spotted with white, Spots warty scatt. Edge with minute white spines
1483 Caulescent, Lvs. ovate acum. glaucous spreading at the edge and back spiny, Spines very broad yellow
4484 Leaves lanc. scattered narrowed at base, Cor, camp. smooth inside
4485 Leaves scattered lanc. Cor. cernuous campanulate
4486 Leaves scattered lanceolate, Cor, tubular campan. Stem smooth
4487 Leaves nerveless whorled cuneate-lanceolate, Flowers solitary with revolute spotted sepals
4488 Leaves scattered, Cor. campan. upright rough inside
4489 Leaves scattered lanc. : the upper whorled, Stem 1 -flowered winged
4490 Leaves scatt. lanc. obl. Cor. erect revol. camp. within papillose withont smooth
4491 Leaves scatt. lin. lanc. Stem 1-flowered, Cor. erect, Pet, with long claws wavy at edge reflexed at end
4492 Leaves whorled, Flowers erect, Cor. campan. Petals clawed
4493 Leaves whorled linear, Flowers reflexed, Cor. revolute campanulate
4494 Lower Ieaves whorled; upper scatt. Flowers racemose reflexed, Cor. revolute
4495 Leaves whorled ovate lanceolate, Flowers reflexed, Cor. revolute
4496 Leaves ternate or scattered lin. falc. 3-nerved ciliated, Pedunc. pubes. Cor, erect rough inside
4497 Leaves ternate or seattered linear 3-nerved ciliated, Pedunc. tomentose, Flowers erect rough inside
4498 Leaves lin. lanc. scattered, Flowers reflexed, Cor. revolute dotted inside
4499 Leaves scattered linear, Pedunc. long, Flowers reflexed, Cor. revolute papillose inside
4500 Leaves scattered lin. subulate, Flowers reflexed, Cor. revolute toothed and warted inside
4501 Like a Martagon, but the stamens are united in a tube
4502 Leaves scattered sessile 5-nerved, The upper cord, ovate, Cor, revolute papillose inside
4503 Leaves linear subulate scattered smooth, Flowers reflexed, Sepals revolute smooth inside

and Miscellaneous Particulars.
brought home in these calabashes, or large gourd-shells, which contain from sixty to seventy pounds weight each. (Thomson's Mat. Med. 14.1.)
In the West Indies, the Cape, and most countries where the woody prickly species abound naturally, they are planted as hedges, and the fibres of the leaves, after being macerated for juice, manufactured into cordage or coarse cloth
A. picta, latifolia, and saponaria are so named from the spots of the leaves, which are of the color of soft soap.
The curious species of aloes, inhabitants of the greenhouse, require but little water: sandy loam, mixed with a iittle lime rubbish or gravel, suits them best; and they flower more abundantly by being exposed to the open air in summer. They are increased by suckers; or leaves, stripped off the plants and laid on a pot of mould, or plarted shallow in it, will produce young plants. (Bot. Cult. 130.)

771 Lilium. From the Celtic word $L i$, which signifies whiteness. The lily has always been considered the

History, Use, Propagatior, Culture,
emblem of whiteness. This is a splendid genus, all the species of which are considered border flowers of great beauty. The more common sorts, species, and varieties, will thrive in any soil and situation, even under the shade of trees. The Canadian, Pomponian, and Philadelphian martagons are somewhat tender, and require the protection of ashes or rotten bark in winter. They are generally planted in borders, and need not be taken up oftener than every three or four years in September, and replanted six inches deep in the October following. None of the species can be safely transplanted after they have pushed leaves, without weakening them so as to prevent their fowering for several years. This remark, indeed, will apply to most bulbous rooted plants. Mr. Griffin, of South Lambeth, whose superior skill in the cultivation of bulbous plants is well known (Hort. Trans. iv. 544.), has been in the practice of keeping the lilium japonicum in pots, protected by a greenbouse or garden frame; but he thinks they thrive best in the former. He places the bulb in twenty-four sized pots, not lower than an inch from the surface of the mould, which is composed of about two-thirds peat and one-third loam, the bottom of the pot being covered to the depth of two inches, with broken pieces of tile and the rough siftings of peat. The plants are kept entirely from frost, and are watered very little when in a dormant state, for they are then very impatient of wet in excess. The pots kept in the greenhouse are placed at a distance from the flue to prevent the mould drying quickly. (Hort. Trans. iv. 554.) Mr, S. Brooks grows in a brick-pit, which he can cover with mats or glasses at pleasure; but he says, it "sppears to be sufficiently hardy to endure our winters, as I have had a bed of them two years in the open ground without protection." (Hoit. Trans. iv. 552.)
772. Tulina. Linnæus classed this among barbarous names. In Persian it is called thoùlybân (De Souxa), whence undoubtedly its origin. In old French it is called tulipan. T. Gesneriana (Gesner, a Zurich botanist), may be called the king of forists' fowers, having been a prime object of attention with this class of cultivators for nearly three centuries. It appears to have been brought to Europe from Persia by way of Constantinople in 1559, and in a century afterwards to have become an object of considerable trade in the Netherlands, and a sort of mania among the growers, who bought and sold bulbs at prices amounting to 5002 . sterling and upwards; in those days an immense sum. The taste for tulips in England was at its greatest height about the end of the seventeenth and the beginning of the eighteenth century. It afterwards declined, and gave way to a taste for rare plants from foreign countries. The tulip, however, is still extensively cultivated in Holland, from which all Europe is supplied with bulbs, and also to a considerable extent in England, both in tradesmen's gardens and in those of the opuient. It is, however, like the auricula, pink, \&c. more the poor man's flower than that of the botanists or country gentleman.

The varieties of the tulip are endless, and their names arbitrary, like those of all florists' flowers. One of the latest London catalogues (Mason's) enumerates six sorts of early blowing tulips; four perroquets or middle blowers; twenty-two double sorts ; and upwards of 600 single late sorts; the last being the only sorts valued by florists as competition flowers. These late sorts are classed by the Dutch as under:-

Prime baguets (baguette, Fr., a rod or wand); very tall; fine cups with white bottoms, well broken with fine brown, and all from the same breeder.
Baguets Rigaut's (supposed from Rigaud, some eminent florist's name, or rougeaude, red face); not quite so tall, but with strong stems, and very large well-formed cups, with white bottoms, well broken with fine brown, and all from the same breeder.

4504 Stem 1-fl, smooth, Flower nodding, Petals acute bearded at end, Leaves lanceolate
4505 Flower erect, Petals lanceol, acuminate, Leaves lanceolate linear
4506 Coat of bulb woolly inside, Leaves ciliated glaucous, Stem and flower smooth
4507 Stem 1-ft. smooth, Flower erect, Petals obtuse smooth, Leaves ovate lanceolate
45.8 Stem 1-f. pubescent, Flower erect, Petals obtuse smooth, Leaves ovate lanceolate 4509 Flower erect stellate with a dark eye, Leaves linear lanceolate
4510 Leaves lin. lanc. convolute, Petals lanceolate greenish outside
4511 One-flowered, Flower from fusiform spreading, Sepals very long caudate
4512 Flowers erect flat, Stem 2-leaved 2-3-flowered, Leaves linear subulate
4513 Raceme comose naked below, Leaves entire

4514 Raceme naked, Leaves oblique
4515 Leaves glaucous numerous oblique, Cor, turbinate
4516 Leaves lanc. alternate remote, Stem 1-flowered naked upwards, Angles of caps. obtuse
4517 Leaves linear whorled opp. and alternate when old cirrhose, Stem many flowered, Capsule winged 4518 Lower leaves opp. Inner flowers among the leaves
4519 Leaves scattered flat coriaceous glaucous, Cor. campanulate revolute at end 4520 Leaves alternate linear nerved flat, Stem 1-flowered
4521 Leaves lin. lanc. alternate; the upper approximated shorter than the terminal solitary flower
4522 Leaves lanc. approximated, the upper opp. as long as the terminal solitary flower, Capsule obtuse angled 4523 Leaves alternate linear channelled, Stem one-flowered
4524 Leaves whorled, Flower erect, Cor. campanulate, Petals sessile

4525 Leaves fleshy spiny at end
4526 Herbaceous caulescent, Leaves ensiform

Incomparable Verports; very perfect cups, cherry and rose, and white bottoms, well broken with shining rown.
Byblomens, or mixt flowers, the flamands of the French florists, with bottoms white, or nearly so, from lifferent breeders, and broken with variety of colors.
Bizarres (bizarre, Fr. odd, irregular); ground yellow, from different breeders, and broken with variety of olors.
What are called breeders are procured from seed, and consist of one plain color on a white or yellow bottom. These being cultivated on a dry and rather poor soil, becoine broken or variegated, and produce new varieties. The time that elapses before they break, varies from one to twenty years or more, and sometimes this change ever takes place, so that whoever thinks of raising new vaxieties of tulips from seed, must be possessed of in mple fund of patience and perseverance. The early dwarf tulip, known among florists as the Van Tholl, is distinct species, T. suaveolens.
In raising tulips from seed, the florists pursue a mode in some respects the reverse of that practised with ther plants. Instead of saving the seed to be sown from the finest variegated tulips, they prefer unbroken lowers or breeders, selecting such of these as have tall strong stems, with large well-formed cups, clear in the ottom. Plants raised from seed saved from the finer variegated sorts, form poor weak breeders of no value. The seed is sown on fine light soil, thinly covered, and protected and shaded by a frame. At the end of the econd year the bulbs are taken up and replanted three inches apart; and again at the end of the fourth year. ;ome will bloom the fourth year, most the fifth, and all of them the seventh year. Being now furnished with set of breeders, all that the floist can do is to take up and replant till they break or shew variegation, which, is already observed, some will do in a year or two, and some not for a long period, or never. Some vary the oil to promote breaking, but in doing this there is often danger of weakening the strength of the flower,
In cultivating choice tulips, an open airy situation, dry at bottom, is made choice of; there excavations are nade commonly in the form of beds four feet broad, of any convenient length, and two and a half or three eet deep. In the bottom a layer of well rotten hot-bed dung is laid and well trod in, and on this two or wo and a half feet of rich fresh sandy loam. On this the roots are planted six inches apart, and covered four nches. The best season is the beginning of November. Ir. very severe winters, protection by mats or by layer of decayed tanner's bark, may be requisite ; but the tulip is very hardy, and almost the only protection $t$ requires is shading and shielding from rain and winds during full bloom. The bulbs should be taken up) nnually, as soon as the flowers are decayed, and kept in a dry airy situation till wanted for planting. (See Madocks, Hogg, Emerton, \&c.)
T. clusiana and T. celsiana are both elegant little border bulbs, inferior indeed to their prototypes in splendour f coloring, but more elegant in their simplicity.
773. Fritillaria. Fritillus signifies a dice-box, and is said to have been the origin of this name. This is a enus with flowers shewy and singular in appearance. They require a deep loamy soil, and are readily inreased by offeets or seeds. They will grow in the shade of trees and shrubs, and do not require to be taken ip above once in three years.
774. Dracena. From $\Delta$ ¢ $\alpha z a y$, , the female of $\delta \rho c e x \omega y$, a dragon, because the inspissated juice becomes a ed powder very like the eastern dragon's blood, D. draco has the habit of a palm. The trunk is nearly

History，Use，Propagation，Culture，
equal in size，which is rarely more than eight or ten inches the whole length；the inner part very pithy，next to this a circle of strong fibres，and the outside soft；the same diameter the whole length；circular marks or rings are left the whole length where the leaves have faller off．The top sustains a large head of these， coming out singly all round it．
775．Phylloma．From фi $\lambda \lambda \frac{}{}$ ，a leaf，and $\lambda \omega \mu \alpha$ ，an edge，in reference to the broad red edge of the leaves．The plant resembles an aloe in foliage and flowers，and requires the same culture．
776．Aletris．From $\alpha \lambda: \alpha \rho$ ，meal，in allusion to the powdery dust with which the whole plant appears to be covered，Small North American plants，which may be cultivated with a little attention in rich leaf mould．
777．Tritoma．From reks，three，and repya，to cut，in allusion to the three sharp edges of the ends of the leaves．（v．Ker，in Bot．Mag．fol，744．）The species of this genus thrive best in peat soil，but will do very well in any other light earth．They are hardy enough to endure our mildest winters in the open air，and only require the protection of a frame in severe frosts．There being also a genus of insects called Tritoma， Professor Link calls this genus Tritomanthe．
778．Veltheimia．Frederick Augustus de Veltheim was a German botanical amateur，of whom nothing more is known．This genus resembles the last，and is of easy culture in any light loamy soil；and readily increased

4527 Leaves lanceolate narrowed each way, Corymb very short terminal many-flowered
4528 Leaves lanc. obliquely bent, Panicle hanging down divaricating
4529 Leaves lanceolate acute discolored
4530 Leaves lanceolate lax, Flowers very fragrant
4531 Head of flowers sessile in the centre of the ovate leaves

4532 Leaves tooth-spiny, Racemes axillary

4533 Flowers stalked oblong tubular, Cor. in fruit smooth mealy, Leaves broad lanceolate mucronate
4534 Flowers sub-sessile campanulate, Cor, in fruit rugose very rough, Leaves lanc. ensiform acute
4535 Leaves with the keel and edge rough, Cor. clavate cylindrical
4536 Leaves with keel and edge smooth, Cor. clavate cylindrical
4537 Leaves with keel and edge rough, Cor. globose at end

4538 Leaves lanc. plaited wavy obtuse, Teeth of the limb rounded straight
4539 Leaves lanc. glaucous curled at edge mucronate at end, Limb spreading
4540 Leaves about 11 spreading flaccid broadly lanceol. ensiform glaucous obscurely barred
4541 Leaves beneath convex lined channelled not barred
4542 Leaves about 19 sub-erect rigid brittle broad lanceolate ensiform glaucous obscurely barred
4543 Leaves lanc. uniform, Style twice as long as stamens, Bractes thrice as short as tube of cor. Flow. sessile
4544 Leaves about three flaccid lanc. ensiform pale-green with scarcely any bars
4545 Leaves lanc. revolute recurved dull green slightly edged with fulvous
4546 Leaves about eleven nearly erect rigid brittle lanc, ensif, with very obscure bars
4547 Leaves smooth oblong acute flat and lin. lanceolate channelled, Style the length of stamens
4548 Leaves with woolly nerves: lower oblong ; rest lin. Pedunc. without bracteæ
4549 Leaves about 12 sub-erect lanc, ensif. much barred with a small bristle at end
4550 Leaves about 20 spreading lanc. ensif. much barred, with 4 - 6 strong lines beneath
4551 Leaves distichous lanceolate ensiform keeled, Flowers solitary sessile

4552 Nectary 1-leaved 6-toothed
4553 Nectary 3-leaved
4554 Leaves quite entire
4555 Leaves crenulate straight
4556 Leaves linear very narrow stiff closely curved back into a semicircle serrulate at edge
4557 Leaves crenate nodding
4558 Leaves erect incurved rough on both sides dull glaucous with strong white marginal threads
4559 Leaves lorate linear lanc. obliquely bent glaucous, Suckers tuberous
4560 Leaves all very flaccid weakly recurved with very strong brownish threads
4561 Leaves in a close head very stiff green rough at edge
4562 Leaves recurved deflexed with a few threads
4563 Leaves a little plaited mucronate, Flowers very close together camp. not opening curved outwards at end
4564 Leaves linear lanc. narrow glaucous with fine white marginal threads
4565 Leaves erect recurved broadly channelled with very strong twisted brown marginal threads

by offsets from the bulbs; or by pulling off the leaves close to the bulb, and then planting them in puts of mould, when, like most other bulbous rooted plants, they will produce bulbs at their base. The species are quite hardy, although usually treated as greenhouse plants.
779. Sanseviera. This is a succulent genus, of the easiest culture and propagation in sandy loam with little water. It is probable that nearly all the numerous kinds adopted here from the works of Mr. A. H.
Haworth, are varieties of one common stock, which in the woods of Guinea sports into an infinite number of forms.
780. Tulbaghia. This was named in honor of _Tulbagh, a Dutch governor of the Cape of Good Hope, who patronized travelling naturalists Very pretty plants, less fragrant than beautiful; they are rarely seen in collections, but may be cultivated in very light sandy peat in a good greenhouse.
781. Yucca, The inhabitants of St. Domingo call this plant Yuca, The species are considered highly desirable from their palm, or oriental pine-apple, or aloe character, and as being evergreens. For this reason they make a striking contrast in gardens and shrubberies, with European shrubs. They grow slowly, and do not flower freely. They are well adapted for a conservatory, as even the reputed hardy species do not thrive generally in the open air.

History, Use, Propagation, Culture,
782. Erythronium. From eguigos, red, in allusion to the color of the flower and leaves. Beautiful little vernal bulbs, the favorites of gardeners, from the cottager's border to the nobleman's flower garden. The E. ainericanum runs very much at the root, and will not flower unless confined and prevented wasting its vigour in long subterraneous surculi.
78. Gloriosa. So named on account of the glorious colors of its flowers, and the elegance of their form, This is a splendid and curious genus, which requires considerable care in its treatment so as to make it flower frecly. The late John Sweet, of Bristol, has given the following directions; "When the stalks and foliage have decayed in the autumn, and left the root, like a well-ripened potatoe, in a dormant state, the pot in which it is, must be removed from the bark-bed (to a dry part of the house) at some distance from the fire : all the warmth at this time necessary being merely what is sufficient to keep the earth in the pot free from diamp: and to prevent the waterings of the house, or other moisture, falling on the earth in the pot, it should be covered, by inverting upon it another pot of the same size; or if larger, it will hang over its edges, and more effectually exclude the wet. If the roots are small, two or three may be placed together in the same pot, whilst in their dormant state; but if they are thus shifted, the mould must be well shaken down in the pot, in order to prevent the access of air to them : the old mould in which they grew must also be used; for fresh earth or sand would stimulate them to inove too early. About the second week in March, the roots must be replanted, putting one or two, according to their size, into pots measuring six inches over. The best compost for them is fresh loam, mixed with an equal quantity of peat-mould, of good quality; the loam should be good, not over rich with dung, nor too heavy. The roots are to be covered about two inches deep; and care must be taken not to break them, unless nature has shown where it is practicable to divide them easily. The pots, when filled, must be plunged into the bark-bed, where the heat should be equal to ninetyfive degrees of Fahrenheit's scale. Water is to be given very sparingly at first; and though, as they grow;

4566 Leaves erect lin. lanc. flaccid glaucous green quite smooth with a slight red elge
4507 Stemless, Leaves linear very straight, scape branched at base, Cor. round campanulate 4568 Leaves few loosely headed long lanceolate, their edges rough
4569 Leaves erect rigid narrow ensiform glaucous with a broad white edge and a few threads
4570 Leaves a little recurved glaucous lin. lanc. at the edge and keel rough, beneath glaucous 4571 Leaves lin. lanceolate recurved almost into a circle deep green $7-8$ lines broad roundish at edge
4.)72 Style filiform

4573 Style clavate 3-cornered
4574 Leaves cirrhiferous
4575 Leaves acuminate
4576 A small plant like a Crocus
4577 Leaves perfoliate ovate
4578 Leaves perfoliate elliptic oblong obtuse, Cor. narrowed at base scabrous within, Anthers cuspidate 4779 Leaves perfoliate ovate lanccolate acute
4580 Leaves perfoliate oblong acute, Petals smooth on both sides, Nect. roundish
4581 Leaves sessile
4582 Leaves stalked
4583 Leaves stem-clasping and stem smooth
4584 Smooth shining, Leaves stem-clasping serrulate ciliated, Anthers short 2-horned
4585 Downy hoary, Leaves sessile cordate acuminate, Pedicels in pairs on a very short stalk
4586 Scape naked smooth, Leaves ovate

4587 Leaves ovate oblong obtuse ciliated, Scape leafless, Umbel capitate
4588 Leaves radical elliptical, Umbel terminal
4589 Leaves cordate, Flowers tetrandrous
4590 Leaves stem-clasping in threes, Raceme terminal simple
4591 Leaves alternate stem-clasping elliptical acute, Raceme terminal simple
4592 Leaves alternate sessile ovate acuminate, Panicle terminal naked
4593 Leaves whorled
4594 Stem furrowed, Leaves alternate amplexicaul. oblong pubescent at edge, Pedunc. axillary 2.fl.
4595 Stem rounded furrowed, Leaves amplexicaul. ovate downy beneath, Pedunc. axill. about 2 - H .
4596 Leaves alternate stem-clasping, Pedunc. axillary 1-f.
4597 Ieaves alternate stem-clasping, Stem round, Pedunc. axillary many-fl.
4598 Leaves alternate stem-clasping acuminate, Stem angular, Pedunc. axillary many-f.
4599 Stem round, Leaves opposite oblong acuminate shining, Pedunc. unnbell. 3-5-flowered

and Miscellaneous Particulars.
they will require a more liberal supply, yet it is necessary at all times to be very moderate in giving it. The heat must be well kept up; and as the roots extend, they must be supported. Under such treatment as I have described, I have known one plant grow ten feet in the course of a season, and to have numerous blossom-stems upon it." It is readily increased by dividing the roots. (Hort. Trans. iii. 2, 3.) The flowers are at first green, they afterwards assume those beautiful markings of yellow for which they are so much esicemed.
784. Bulbocodium. From ßu入ßas, a bulb, and ж $\quad \omega \delta s o v$, wool; its bulb is enveloped in a rough and velvetty covering. A beautiful little vernal flower resembting a small species of Colchicum.
785. Urularia. A diminutive of $u v a$, a bunch of grapes, A genus of little beauty and of easy culture,
786. Streptopus. From $5 \rho \in \phi \omega$, , to turn, and $\pi 85$, a foot, or, in botanical language, stalk. Its flower-stalks are constantly twisted. A plant like an Uvularia in habit.
787. Convullaria. From convallis, a valley, in allusion to the places where it grows. (Muguet, Fr.) C. majalis is an elegant and delicate scented plant, which has long been a favorite of the florist; though, as it is not a native of hot countries, it is not likely to be the Lily of the Valley of Solomon. Notwithstanding the fragrance of the flowers when green, yet when dried they have a narcotic odour, and if reduced to powder excite sneezing. An extract prepared from the flowers or from the roots partakes of the bitterness, as well as of the purgative properties, of aloes. A beautiful and durable green colour may be prepared from the leaves with lime.

The plant is very common in the woods about Woburn in Bedfordshire, and from thence the London markets are supplied with the flowers. It forces freely, and few plants are more eligible for that operation.
788. Smilacina. A diminution of Smilax, another genus of plants, which sce in its place. These are very pretty little hardy American flowers, requiring some delicacy in their management.
789. Polygonatum. From roivs, many, and yove, a knee; on accomnt of the numerous articulations of its

History, Use, Propagation, Culture,
stem. The English name arises from the roots, which in P. vulgare are full of knots, and a transverse section of them shews characters which dreamers have discovered to represent the impress of the famous seal of Solomon.
790. Ophiopogon. From opıs, a snake, and $\pi \omega \gamma o y$, a beard: snake's-beard. This plant is best grown in pots, as it requires the protection of a frame during severe frosts.
791. Eucomis. From $\varepsilon$, well, and xopen, hair; on account of the fine tuft of leaves, in botanical language called coma, by which the stem is surmounted. Handsome herbaceous plants which are nearly hardy.
792. Brodiaa, Named by Sir James Smith, after James Brodie, Esq. of Brodie House, a gentleman to whom the botany of Scotland is indebted. Highly curious little plants with blue flowers.
793. Peliosanthes. From $\pi \varepsilon \lambda 605$, livid, and cey. 905 , a flower, in allusion to the color of the flowers. Tcta is the namse of the plant in India; and having been adopted by Dr. Roxburgh, ought not to have been neglected in this country.

4600 Scape naked, Leaves linear thrice as long as scape
4601 Scape naked, Raceme spiked, Flowers aggregate
4602 Scape clavate, Leaves broad lanceolate acute
4603 Scape clavate, Leaves multifarious expanded
4604 Scape clavate, Leaves elliptical acute twin lying on the ground
4005 Scape cylindrical, Leaves tongue-shaped obtuse lying on the ground
4606 Scape cylindrical, Leaves ovate oblong wavy spreading, Crowin as long as raceme
4607 Scape cylindrical, Leaves oblong lanceolate channelled spreading, Crown short, Racemes long 4608 Scape cylindrical, Leaves lanceolate spreading striped, Crown short, Raceme long

4609 Flowers large lax, Leaves of corona lanceolate undıvided
4610 Leaves of the corona subulate
4611 Flowers clustered, Leaves of corona bifid
4612 Scape shorter than ovate-lanceolate leaves
4613 Scape branched longer than leaves

## 4614 The only species

4615 The only species

> A. Stem leafy. Leaves not fistular.

Umbel not bulbiferous. Leaves flat.
4616 Umb. globose, Stam. 3 cusp. Sepals with a rough keel
4617 Stam. tricuspidate, Root tunicated
4618 Umb. globose, Stam. tricuspidate twice as long as flower
4619 Umb. capitate, Stam. subulate twice as long as flower
4620 Umb. capitate, Stam. lanceolate longer than flower, Leaves elliptical
4621 Umb. fastigiate, Stam. subulate, Leaves linear ciliated
4622 Stam. filiform thrice as long as flower, Leaves oblique
4623 Cauline leaves lanceolate, Umbel dense depressed, Stamens subulate shorter than flower
4624 Umb. fastigiate, Sepals emarginate, Stamens very short simple
4625 Stam. 3-pointed as long as flower, Leaves very narrow, Scape declinate
4626 Very upright, Leaves channelled
4627 Umb. loose few-flowered, Leaves smooth
4628 Very like Allium subhirsutum differing only in the smallness of the flowers, Sepals 3 lines long
Umbel not bulbiferous. Leoves not flat.
4629 Stamens simple, Umbel fiat, Leaves half-rounded
4630 Outer peduncles shorter than the rest, Stamens 3-pointed
4631 Flowers pendulous, Sepals ovate, Stam. longer than flower
4632 Flowers pendulous truncated, Stam. simple as long as flower
4633 Pedunc. capillary effuse, Stam. simple, Spathe very long
4634 Stam simple twice as long as flower, Spathe as long as flower-stalks: one valve shorter
4635 Umbel globose, Stam. 3-pointed, Flowers lateral nodding, Leaves half-round
4636 Stamens simple twice as long as flower, Umbel globose, Spathe subulate very long
4637 Umbel fastigiate about 6-flowered, Sepals acute, Stamens simple, Leaves setaceous
4638 Umbel globose very dense, Spathes lanc. as long as flow.-stalks, Stam. 3-pointed longer than fl. Lvs, $\frac{1}{2}$ round 4639 Flower-stalks neariy equal, Sepals ovate conniving as long as simple stamens, Style longer than stamens 4640 Spathe ovate shorter than umbel, Stamens simple shorter than fiower
4641 Leaves half-round, Stamens 3-pointed longer than flower
4642 Umbel globose, Stamens simple longer than flower, Spathe subulate
4643 Umbel sub-globose, Stamens 3-pointed shorter than fower
Umbel bulbiferous. Leaves flat.
4644 Sheaths of leaves rounded, Spatheblunt, Stamens 3-pointed
4645 Umbel spreading, Feduncles nodding, Stamens subulate, Spathes with very long points 4646 Flowers all male, Stamens 3 -pointed, Spathe with a very long point

and Miscellaneous Partzculars.
794. Aphyllanthes. From $\alpha$, privative, $¢ \cup \lambda \lambda o v$, leaf, and $\alpha y(0)$, a flower; leafless flower. Its stems are naked, like a rush, and bear on their summit a little tuft of blue flowers.
795. Sowerbca. So named in honor of the late James Sowerby, an excellent draughtsman and ingenious naturalist. The power he possessed of representing the general features of plants within the compass of a few inches, as in his English Botany, has never been possessed in the same degree by any other individual than the late Sydenham Edwards. His execution as an artist is fully attested by the superb plates of the Flora Londinensis, of his own Fungi, and indeed of almost every botanical work of merit which appeared during his life. His talents and his reputation are inherited by his sons. This plant requires plenty of water, and is easily increased by dividing the roots.
796. Allium. From the Celtic all, which signifies hot or burning. This is a genus of strongly scented bulbous plants, all of them edible, and some of them of the greatest antiquity as potherbs.

History, Use, Propagation, Culture,
A. Porrum. (From pori, in Celtic, to eat.) Leek, Engl, Poireau, Fr., Lauch, Ger., and Poro, Ital., ha a cylindrical scaly imperfect bulb, which is blanched in gardens, and much used in soups and stews. It is sown in March, transplanted in May in shallow drills, and being slightly earthed up as it advances, is fit for use in October, and remains in that state till April or May following.
A. sativum, Ail, Fr., Knoblauch, Ger., and Aglio, Ital., has soboliferous bulbs, which are used in seasoning, and sometimes in medicine. It is cultivated by dividing the bulb, and planting the soboles in February or March. They are fit to take up in the September following, and laid up in a dry situation till wanted for use.
A. scorodoprasum. (From oxogodov, onion, and reowoy, leek, as if both leek and onion.) Ail d'Espagne, $\mathrm{Fr}_{\text {r }}$, Rockenbolben, Ger., and Scorodopraso, Ital,' has bulbs like garlic, but the soboles or cloves are smaller. It is cultivated for the same purposes as that species, and is considered as having a more delicate flavor.
A. ascalonicum (growing near Ascalon). Eschalôte, Fr., Schalotte, Ger., and Scalogni, Ital., is the mildest of cultivated Alliums. It has a soboliferous bulb, small fistular leaves, and seldom fiowers. It is propagated by the clove, planted in autumn or spring, and taken up for use in August or September. It is very subject to insects, which autumn and shallow planting are found to counteract. (Caled. Mem. i. 109, and Hort. Trans, ii. 98. Encyc. of Gard. 3847.)

4647 Bulbs compound, Stamens 3-pointed
4648 Leaves crenulate, Sheaths 2-edged, Stamens 3-pointei
4649 Like Allium carinatum, but the stamens are three-pointed
4650 Stamens subulate twice as long as flower, Spathe longer than umbel
Umbel bulbiferous. Leaves not flat.
4651 Leaves half round, Spathes much longer than umbel, Sepals obtuse, Stamens simple exserted
4652 Stamens 3-pointed
4653 Leaves' rough half-round furrowed beneath, Stamens simple

## B. Leaves radical, not fistular.

4654 Scape rounded, Umb. many-fl. fastigiate, Leaves linear channelled angulár beneath, Stam. subulate
4655 Scape rounded, Leaves lin. lanceol. Umb. fastigiate, Sepals very narrow, Stamens simple
4656 Scape Younded, Leavès lanceolate, Umb. hemispherical, Sepals spreading, Stamens simple
4607 Scape rounded, Lvs. lin. lanc. wavy, Úmb, hemispherical, Roots very long, Stam. simple twice as' long as ft.
4658 Scape oblique 4 cornered, Leaves linear, Umb. fastigiate, Stamens simple as long as fi.
4659 Scape rounded, Leaves half-round, Spathe acum, longer than umbel, Stam. simple longer than flower 4660 Scape $\frac{1}{2}$ rounded, Leaves lanceolate acuminate flaccid ciliated sheathing, Umbel fastigiate, Sepals obtuse 4661 Scape 2-edged angular, Umbel clustered, Stamens simple as long as flower, Leaves linear oblique
4669 Scape nearly-2-edged, Umbel capitate, Stamens longer than fower, Leaves linear spiral
4663 Scape 2-edged, Umb. drooping before flowering, afterw. erect, Lvs. lin. flat, Stam. 3-pointed longer than ff.
4664 Scape rounded, Leaves subulate, Umbel globose, Stamens 3 -pointed
4655 Scape 2 edged, Leaves linear convex and smonth beneath, Umbel roundish, Stamens subulate
4666 Scape rounded very long, Leaves linear channelled, Stamens subulate connate at base
4667 Scape 2-edged, Leaves linear channelled angular beneath, Umbel fastigiate
$46 \pi 8$ Scape 3-cornered shorter than the lin. furrowed leaves, Umb. fastigiate, Stamens simple, Sepals obtuse 4669 Scape rounded longer than the linear subulate leaves, Umb, fastig. Stamens simple, Sepals mucronate 4670 Scape rounded, Leaves linear
4671 Scape 3-cornered, Leaves lanceolate stalked, Umbels fastigiate
4612 Scape and leaves 3-cornéred, Stamens simple
4673 Scape rounded, Leaves linear flat ciliated, Umb. few-flowered, Sepals obovate concave
4674 Scape, hearly cylindrical, Leaves lanceolate sessile, Umbel fastigiate
4675 Scape half-round, Leaves lanceolate oblong flat smooth, Umbel globose, Seeds solitary
4676 Scape 4-cornered, Umb. fastigiate cernuous, Leaves linear flat, Stamens subulate longer than flower
4677 Leaves twisted linear, Umbel loose, Filam, subulate as long as flower
4078 Scape rounded longer than leaves, Umb. compact,. Stam. subul. as long as flower
4679 Scape rounded at end, Umbel half globose, Leaves linear flat chann. at base, Stam. subul. longer than'f.
4680 Scape rounded, Umb, fastigiate, Leaves half-round compressed, Stam, lanceolate shorter than fl.
4681 Scape' rounded, Umb. few-flowered fastigiate, Leaves lin. channelled, Stam. lanceolate shorter than fl.

## C. Leaves fistular.

4682 Scape leafy, Umb. fastigiate, Spathes nearly equal, Sepals mucronate
4683 Scape' leafy at base
4584 Scape fistular twisted, Umb. bulbiferous proliferous, Stamens 3-pointed
4685 Scape rounded with an angle, Leaves linear obtuse, Umb, rounded, Stamens setaceous twice as long as' f .
4686 Scape ventricose beneath longer than the round leaves
4687 Scape as long as the round ventricose leaves
4688 Scape as long as the round subulate leaves
4689 Scape not quite naked round, Leaves half-rouind, Stamens subulate, Sepals lanceolate acute
4690 Scape round, Leaves setaceous subulate ciliated, Sepals ovate lanceolate emarginate at ends $\$ 691$ Scape scarcely any, Capśules cernuous, Leaves flat ciliated
\& 1. Three stamens fcrtile.
4692 Inner sepals glandular at end infiexed, Leaves subulate channelled recurved
4693 Inher sepals'glandular at end inflexed, Peduncles spreading, Leaves linear lanc. flat reflexed

A. cepa. (Cep signifies head in Celtic.) Oignon, Fr., Zuiebel, Ger, and Cipolld, Ital., is universally cultivated for the kitchen, and is used as a pot-herb, salad, and pickle. It is commonly raised from seed, which is sown on rich, loamy, and rather moist soil, in March; and being thinned, weeded, and the soil stirred, the bulbs will be fit to take up in September, when they may be kept through the winter like potatoes or apples, It is also grown from small bulbs, which are planted on the surface of the soil in March, and swell to a large size (if not earthed up) in the courrse of the season. Sometimes onion-seeds are sown in autumn in a very dry situation, and the young plant's are taken up and transplanted in spring: or a sowing is made very early in spring on a warm border or on a hot-bed, and the crop transplanted from that.

There is a variety cafted the underground-onion, which multiplies its bulbs by offets, below the surface.
The specres called the tree onion, like several others, produces its bulbs instead of or among the umbel of flowers. It is occasionally cultivated, but chiefly as matter of curiosity.
A. fistulosum is grown chiefy as a scallion, or spring satad onion. It has almost no bulb, but large succulent fistular leaves, strong, in fiator. It is sown in autumn, and fit to be used in spring.
797. Albuca. Derived from "dolous, white, in allusion to the color of the flowers of this genus. Not a very happy allusion though, becalise the flowers are mostly green. The stem of the Asphodel was called albuca iry

History, Use, Propagation, Culture,
the Latins. A genus of little beauty, but of easy management in sandy loam and decayed vegetable soil, and propagation is effected by suckers from the old bulbs; or by taking off leaves with a scale, and planting them round the edge of a pot of sandy loam.

799. Thysanotus. From Fuocevos, a fringe, on account of the fringe of the sepals. Elegant little New Holland plants, with bright purple blossoms and slender grassy leaves.
800. Eriospermum. From setoy, wool, and $\sigma \pi \in e \mu n$, sced, on account of the envelope of the seed. Very curious little Cape plants, with deformed or unusually shapen leaves.
801. Gagea. Named by R. A. Salisbury, Esq., after his friend Sir Thomas Gage, a great amateur of botany. A genus of curious little bulbous plants, none of which exceed the height of more than three or four inches, and principally distinguished from Ornithogalum by the yellow color of their flowers.

4694 Inner sepals glandular' at end infexed, Scape erect, Fl. nodding, Lvs. linear subulate channelled smoth 4695 Inner sepals glandular at end inflexed, Peduncles spreading at right angles, Lvs, lanc. lin. obliquely bent 4696 Inner sepals glandular at end infl. Scape erect wavy, Fl. cernuous, Lvs. lin. subul chann. outside hairy 4697 Inner sepals vaulted at end, Leaves smooth, Peduncles the length of bractes

## § 2. Six stamens fertile.

4698 Inner sepals vaulted at end, Leaves lin. flattish, Scape shorter than leaves, Pedunc. very long spreading 4699 Inner sepals glandular at end inflexed, Leaves lin. lanc. convol. upright shorter than scape
4700 Inner sepals glandular at end reflexed, Leaves lin. lanc. flattish, Pedunc. at right angles, Flowers erect 4701 Scape shorter than leaves few-flowered, Flowers nodding, Filam. 2-toothed
4702 Leaves lanceolate, Raceme pyramidal before the leaves, Filam. glandular at base
4703 Leaves lin. subulate channelled, Scape simple shorter than leaves, Scales of root wrinkled across
4704 Inner sepals glandular at end inflexed, Lvs. lin. lanc. flat, Pedunc, very long erect spreading, Fl. upright 4705 Inner sepals vaulted at end, Leaves lin. lanceol. channelled upright, Pedunc. shorter than nodding flow. 4706 Inner sepals vaulted at end, Leaves lin. lanc. channelled, Pedunc, spreading the length of nodding flow. 4707 Inner sepals vaulted at end, Lvs. lin. subul, chann. hairy clammy, Ped. spread. twice as long as nodd. fl. 4708 Inner sepals vaulted at end, Leaves lin. subulate convolute at the end spirally twisted villous

4709 Stem very short, Leaves 2-edged lengthwise, Scape very long higher than the spike
4710 Stemless, Leaves 3 cornered flat in front beyond the middle hollowed, Scape very long higher than spike 4711 Stemless, Leaves 3 comered below the middle in front little raised above middle concave, Bracts very long

4712 Roots fibrous, Stems branched diffuse rounded striated, Branches somewhat angular, Anthers unequal 4713 Bulbs fascicled, Leaves radical channelled nearly as long as the rounded simple stem

## 4714 Leaves roundish acuminate cucullate at base <br> 4715 Leaf sub-cordate acute cucullate pubescent

4716 Leaves ovate lanceolate at the edge wavy involute
4717 Leaves elliptical obtuse fat
4718 Leaf proliferous, Ieaflets filiform undivided sessile
4719 Radical leaf linear flat, Peduncles simple umbellate, Sepals obtuse smooth, Bulbs clustered
4720 Radical leaf linear lanc. flat, Pedunc. simple somewhat umbellate, Sepals obtuse smooth, Bulb solitary 4721 Leaves linear filiform upright, Pedunc, about 3 with a three-leaved involucrum
4722 Scape angular naked, Pedunc. umbellate branched pubescent, Sepals lanc. acute
4723 Scape naked, Pedunc. 3 umbell. pubescent, Leaves filiform, 'I'hree outer sepals longer than the others
4724 Leaves half cylindrical, Cauline dilated at base

4725 Scape 2-leaved, Leaves opp. Pedunc. 1-f1. Outer sepals lanc. retuse : inner ellipt. twice as broad
4726 Scape naked, Flowers umbelled, Filam. all 2-forked bearing the anther in the middle
4727 Raceme few-flowered, Sepals lanceolate, Leaves filiform channelled, Filam, subulate
4728 Corymb few-flowered, Pedunc. longer than bractes, Filam, subulate
4729 Raceme spiked many-f. Lvs. lin. lanc. weak, Every other stamen with two teeth, Bractes longer than f. 4730 Raceme oblong, Filam. lanceolate membranous, Pedunc. and fi. spreading
4731 Corymb few-flowered shorter than lanceolate strongly fringed leaves
4732 Raceme very long, Sepals linear obtuse, Filam. lanceol. equal, Style the length of stamens
4733 Raceme very long, Sepals lanc. oblong, Filam. broad lanceol. alternately shorter
4734 Raceme long, Filam. subulate alternate lanceolate, Bractes membranous ovate twice as long as pedunc.
4735 Raceme few-fowered, Sepals linear oblong obliquely bent emarginate, Filam. lanc, subul. Leaves linear 4736 Leaves short oblong erect, Scape very long, Flowers campanulate the length of stamens
4737 Raceme very long, Filam. subulate, Pedunc. much longer than flower, Leaves lanceolate
4738 Raceme very long, Filam. subul. Pedunc. length of fl. Bractes the length of pedunc. Lvs. lin. lanc. loose
4739 Lvs. glaucous twisted upwards, Raceme divaricating on a long scape, Filaments with an ovate base 4740 Raceme very short, Bractes lanc. the length of flowers, Sepals obtuse, Filam. subulate
4741 Raceme conical, Fl. numerous ascending, Sepals oblong flat, Stam. lanc. equal, Style very short

and Miscellaneous Particulars.
802. Ornithogalum. From osys 905 , a bird, and roic, milk. No good explanation has been offered of the application of this word; that of Tournefort is not worth quoting. O. squilla is the officinal squill. It lias a bulb almost as big as the human head, pear-shaped, and tunicate like the onion. From the middle of the root arise several shining leaves a foot long, and two inches broad at their base, lessening all the way to the top, where they end in points. They continue green all the winter, and decay in the spring; then the fowerstalk comes out, rising two feet high, naked about half way, and terminated by a pyramidal thyrse of white flowers.

The squill is one of the few medicines known in the early ages of Greece, which is still held in great estimation. It is very nauseous, intensely bitter and acrimonious, without any perceptible smell. It is poisonous to several animals: if much handled it exulcerates the skin; and in large doses frequently repeated, it not only excites nausea, but strangury, bloody urine, and hæmorrhoids, with fatal inflammation and gangrene of the stomach and bowels. Under proper management, however, it is a medicine of great practical utility. In

4742 Raceme long, Filam;' subul. Sepals lanc, at the end callous inflexed, Leaves linear depressed flat 4743 Raceme few-fl. Filam. subulate, Sepals lin. obtuse : 3 outer bearded at end; inn. mucron. Leaves filiform 4744 Raceme long many-fi, Filam. subulate, Sepals lanc, acute, Leaves filiform subulate
4745 Leaves filiform fleshy, Scape few-flowered
4746 Corymb many-flowered, Filam, subulate, Cor, broadly campan. Outer sepals obsoletely 3-toothed
4747 Corymbs many.ff. racemose, Filam. alternately forked, Leaves lanceolate
4748 Raceme contracted corymbose, Filam, alternately emarg. Leaves lanc. with cartilaginous teeth
4749 Like the last, but the flowers very yellow, and the bractes very narrow the length of the flower-stalk
4750 Raceme many-f. contracted, Altern. filam, emarginate, Leaves linear channelled
4751 Raceme very long, Leaves lanc. linear, Flowers spreading, Stam. dilated alternately wedge-shaped 4752 Leaf solitary longer than scape, Flowers few spiked sessile
4753 Flowers without the leaves, Bractes reflexed

4754 Raceme conical oblong
4755 Corymb clustered conical
4756 Raceme oblong conical, Sepals lined
4757 Raceme few-flowered, Peduncles without bracter, Leaves lanceol. lying on the ground
4758 Scape angular, Peduncles alternate shorter than flower, Bractes obtuse very short
4759 Four-leaved, Scapes many half-rounded striated 2-flowered decurmbent after flowering
4760 Scape angular, Raceme corymbose, Peduncles twice as long as A. Bráctes obsolete
4761 Raceme few-flowered with bractes, Flowers campanulate, Leaves linear channelled : radical many
4762 Leaf roundish somewhat spiked on one side
4763 Raceme cylindrical many-fowered, Sepals half as long again as the ovaries, Peduncles colored
4764 Leaves filiform linear; Flowers corymbose, Peduncles raked ascending the length of the flower
4765 Flowers rácemose, Ledves lancelate linear'about two elevated on a scape
4766 Scape rounded, Corymb few-flowered umbelled, Bractes filiform the length of peduncles
4767 Flowers campanulate 6-parted, Raceme cernuous
4768 A species which has not yet been seen in flower, nor described
4769 Raceme many-f obl. conical, Flowers campan. erect, Bractes 2-parted longer than pedunc. Lvs. lanceol.
4770 Flowers campanulate 6-parted revolute at end

471 Flowers 6-parted, Raceme cernuous, Leaves shorter than scape
4772 Flowers funnel-shaped corymbose erect, Scape shorter than the leaves
4773 Scape longer than keeled linear leaves, Spike racemose, Five sepals ascending; the lower deflexed
4774 Flowers campanulate half six-cleft racemose, Stamens membranous
4775 The only species, like a pale-flowered variety of Scilla sibirica
4776 Leaves roundish smooth
4777 Leaves lanceolate oblong acuminated
4778 Leaves roundish smooth towards the end muricated
4779 Leaves roundish veiny warted rough
4780 Leaves ovate and lanceolate with hairy tubercles, Sepals filiform
4781 Leaves lanceolate and elliptical veinless warted, Warts naked, Sepals ovate
4782 Leaves oblong lanceolate flat smooth
4783 Leaves lanceolate wavy smooth
4784 Leaves lanceolate, Sepals much shorter than the tube, Filam. capillary alternately longer
4785 Scape naked simple, Stamens twice as long as flower, Leaves linear channelled

and Miscellaneous Particulars.
applied to this plant by Dodonæus, because it has not the marks of $\mathbf{A i}, \mathbf{A i}$, on the petals, as other hyacinth are supposed to have, and therefore is not the Hyacinthus poeticus. This idea has its origin in the Roman mythology, in which Apollo, being much grieved for the death of the youth Hyacinthus, changed his blood into a flower which bore his name, \&c. It is a native of almost every part of Europe and of Persia.
804. Puschkinia. Named after Count Mussin Pouschkin, a Russian botanist and patron of botany. A very remarkable little plant, resembling a Scilla in appearance, but well defined by the very curious union of its stamens into a cup
805. Massonia. So named by Thunberg, after Mr. Francis Masson, author of Stapeliæ Novæ; a successful botanical collector at the Cape of Good Hope, Madeira, the West Indies, and finally North America, into whose wildernesses he went to die. Very singular plants, with broad leaves lying flat on the ground, and compact umbels of flowers.
806. Eremurus. From छंgnuos, desert, and śge, a tail: tail of the desert. Its long spikes of yellow flowers may be easily imagined to merit such an appellation in their native abodes.

4786 Leaves fleshy rounded, Stem shrubly erect branched
4787 Leaves fleshy rounded glaucous, Stem shrubby short rooting
4788 Leaves fleshy tongue-shaped lanceolate flat on both sides
4789 Leaves fleshy linear acuminate channelled, Scape twice as long as leaves
4790 Leaves fleshy subulate half rounded flexuose glaucous 3 times as short as scape
4791 Leaves fleshy subulate rounded, Scape racemose
4792 Leaves ensiform fleshy 3 cornered fringed, Scape simple, Raceme very long

4793 Stem leafy, Leaves 3 cornered striated
4794 Stem leafy, Lvs. subul. 3 cornered striated, Bractes membranous lanceol. : the upper longer than flowers
4795 Stem naked branched, Pedunc. altern. longer than bract, Leaves ensiform carinate smooth
4796 Stem naked simple, Pedunc. clustered the length of bractes, Leaves linear keeled smooth
4797 Stem naked, Leaves upright striated subulate fistular
4798 Leaves linear weak, Scape erect branched, Flowers small
4799 Stem leafy naked above branched, Leaves filiform striated toothed ciliated
4800 Stem nearly naked, Leaves upright cylindrical fistular
4801 Leaves fleshy lanceolate flat concave at base reflexed at end, Raceme nodding at end
4802 Leaves fleshy oblong lanceolate acuminate nerved straight 4 times as short as scape
4803 Leaves flattish, Scape 1-flowered
4804 Leaves Alat, Scape branched, Flowers flat, Pistils straight
4805 Leaves linear keeled shorter than the branched scape, Flowers clustered in threes pendulous
4806 Leaves linear channelled smooth cartilaginous at edge, Scape simple
4807 Leaves lanc. linear channelled with an obtuse concave end, Scape and raceme simple, Flowers spreading
4808 Raceme simple long many-flowered, Pedunc. spreading in flower, appressed in fruit
4809 Roots fibrous, Filaments declinate: the outer not bearded
4810 Leaves filiform flexuose reflexed longer than scape, scape simple filiform, Raceme few-flowered
4811 Leaves fiaccid glaucous with the edge and nerves rough, Stem panicled branched, Filam. not bearded
4812 Leaves oblong, Raceme corymbose, Stamens dilated in middle papillose
4813 Leaves fleshy linear-subulate half-rounded upright
4814 Leaves fleshy compressed hispid
4815 Leaves rounded filiform upright shorter than scape, Scape simple
4816 Leaves linear filiform flexuose reflexed at base ciliated the length of the branched scape
4517 Leaves filiform rounded roughish, Filaments smooth, Sepals lanceolate
4818 Leaves flat smooth linear lanceolate acute, Scape simple, Raceme many-flowered cylindrical compact
4819 Leaves 3-cornered rough, Scape branched, Flowers revolute
4820 Leaves linear ensiform keeled 3-cornered shorter than the branched scape
4821 Leaves linear flat depressed shorter than the branched scape, Alternate sepals wavy
4822 Leaves channelled sword-shaped, Scape simple, Bractes remote 3-flowered
4823 Leaves fleshy hairy sword-shaped 3-cornered channelled on the narrow side, Scape simple
4824 Leaves fiat, Scape simple, Flowers flat, Pistil declinate
4825 Leaves flat, Scape simple, Flowers campanulate, Stamens declinate
4826 Racemes divided, Pedicels clustered, Inner sepals crenulate, Capsules pendulous
4827 Raceme divided, Bractes leafy, The bearded half of filam. with 2 appendages at base, Lvs. lanc. ensiform
4828 Stemless, Leaves lanceolate radical little longer than simple scapes
4829 Leaves flat, Scape branched, Peduncles clustered, Flower flat
4930 Lvs. lanceol. acuminate upright spreading, Panicle branched upright many-flowered, Branches smooth
4831 Flowers nodding, Stamens propendent, Filaments striped, Leaves flat, Bulbs clustered
4832 Leaves ensiform, Filaments woolly
4833 Bractes unequal : the lower embracing the stalk; the upper setaceous

## and Miscellaneous Particulars.

810. Arthropodium. From deg gat, a joint, and $\pi \Delta 5$, a foot, on account of the jointed footstalks of the flowers. Distinguished by its bearded filaments.
811. Chlorophytum. From $\chi \lambda \omega g o s$, green, and $\phi u \tau \circ v$, a plant. Very inconspicuous flowers requiring a barkbed, but easily cultivated under such circumstances.
812. Casia. Named after Frederick Cæsius, who lived in 1703.
813. Narthecium. From yaging, a rod or wand, in allusion to the slender spike of flowers. This genus resembles a small Anthericum, from which genus it has been separated.

History, Use, Propagation, Culture,
814. Dianella. A diminution of Diana, the name which the genus originally received from Commerson. The species are found in the recesses of forests, where the goddess of hunting may be supposed to inhabit.
815. Eustraphus. From ev, well, and seєષw, to turn, in allusion to the twining habit of the species.
816. Asparagus. From $\sigma \pi \propto \rho \sigma \sigma \omega$, to tear, on account of the strong prickles with which some of the species are armed. Some are diocious, and others are prickly evergreen climbers. A. officinalis, Asperge, Fti., Spargel, Ger.; and Asparago, Ital, is one of the oldest and most delicate of culinary vegetables. It is found on the sea-shores in different parts of Britain and in many parts of Europe, and is abundant in the inland sandy plains in Russia, Turkey, and Greece. Asparagus was in much esteem both among the Greeks and Romans. It is much praised by Cato and Columella, and Pliny mentions a sort which grew near Ravenna, a deep sandy country, three shoots of which would weigh a pound. It is equally admired by the moderns, and assiduously cultivated in private gardens everywhere, and to a great extent round London, Paris, and Vienna: In no part of the wortd is it grown to such perfection as in the market gardens round London. That of the parish of Mortlake is particularly strong and succulent : the soil is a sandy loam, deeply trenched, and well manured; the seed is sown in drills and thinned out till the plants stand six inches apart in the row, and the rows are a foot asunder. Round Paris and Vienna more pains are taken in preparing the soil, by forming excavations and filling them with layers of turf, durable manure, as bones, wood-chips, \&c., sand, manure, loam, \&c. ; but though plantations on such beds last longer than on our's, they do not yield better shoots, and it may justly be questioned whether they are equally profitable to the cultivator.

The culinary preparations of asparagus are few, its very delicate flavor rather being deteriorated than improved by powerful tastes. It is best boiled and served alone, to be eaten with butter and salt; or with the points of the shoots cut in small pieces, and served up as green pease. It is esteemed diuretic, and in Paris

4834 Radical leaves sword-shaped flat shorter than the stem with the keel and edges smooth, Panicle simple 4835 Radical leaves ensiform long smooth at the edge and keel, Panicle upright 4836 Leaves bright-green smooth, Panicle lax decomp., Sepals of pendulous flower reflexed, Filam. strumous 4837 Leaves linear-lanceolate at the edge prickly, Keel smooth
4838 Stem leaves numerous long enşiform rough at the edge and keel, Branches of panicle short 4839 Leaves radical lin.-lanceolate at the keel and edges smooth, Panicle decompound straggling

4840 Leaves ovate or elliptical-lanceolate, Anthers after, flowering twisted 4811 Leaves linear or linear-lanceolate, Anthers after flowering straight

4842 Stem herbaceous round erect, Leaves setaceous
4843 Stem herbaceous erect rounded, Leaves setaceous -whorled and whorled, Stipules solitary unarmed
4844 Stem half-climbing, Branches straggling, Leaves setaceous curved, Flowers globose
49,45 Stem unarmed rounded, Branches deelinate, Leaves setaceous
4846 Stem much branched wavy, Leaves setaceous pungent, Flowers campanulate
4847 Stem herbaceous unarmed decumbent much branched, Branches wavy, Leaves setaceous
4848 Herbaceous unarmed twining, Leaves lanceolate falcate
4849 Stem herbaceous erect, Branches straight, Leaves bundled setaccous long, Pedunc. sol. nodding
4850 Prickly solitary recurved, Branches round, Leaves fascicled linear falcate, Pedunc. 1-fl. clustered

4872 Leaves bright green channelled striated, Sepals oval the length of stamens
4873 Leaves glancous, Raceme lax, Sepals linear much spreading longer than stam.

and Miscellaneous Particulars.
is much resorted to by the sedentary operative classes, as taylors, weavers, \&c. when they are troubled with, symptoms of gravel or stone.
There are some varieties and subvarieties of asparagus, but excepting the red-topped and green-topped, the: others are merely local, varieties, and can hardly be said to be obtainable by seed.
In the kitchen garden asparagus is generally grown in beds fnur feet broad, and in rows a foot or eighteen inches apart by nine inches in the row. The plants are either raised from seed where they are to remain, or $r$ raised on a seed bed the preceding year and transplanted. The value of the crop depends on the soil being dry, sandy, trenched two and a half or three feet deep, and powerfully manured. During winter the beds are covered with dung or litter to protect them from the frost. In spring this is raked off into the alleys and dug in, white the beds are stirred with a fork, to admit the air, heat, rain, \&c, to stimulate the rising shoots. Asparagus from seed,will be fit to cut the third year, in perfection the fifth, and will continue good for ten or twelve years. The season for cutting is from the middle of April to the middle of June.
Asparagus is extensively forced, generally by taking up the roots and placing them on dung or tan beds; but sometimes a more gentle forcing is given by covering the beds with dung in the manner of forcing sea-cale. By the former mode earlier crops are obtained, but the roots are lost; by the latter, the crop is only forwarded
817. Drimia. So called from the Greek word the following year.
817. Drimia. So called from the Greek word $\delta$ gou $\omega$, caustic, because the juice of the roots is so very acrid, as, when applied to the skin, to cause inflammation and even blisters.
818. Uropetalon. From \&' $\rho \propto$, a tail, and $\pi \varepsilon \tau \propto \lambda o v$, a petal, in allusion to the manner in which the divisions of the flower are lengthened out. Curious and rare bulbous plants, very nearly related to Zuccagnia; perhaps not.generically distinct.

History, Use, Propagation, Culture,

819. Hyacinthus. Every one knows the fable of Hyacinthus, who was killed by Apollo and changed to this flower. Bochart, however, remarking that the ancients applied the name to a red flower, concludes that the Arabic yâgout, which signifies red, has something to do with the name. A conjecture certainly sufficiently learned, but less plausible.
H. orientalis is the origin of one of our finest florist's flowers, and, like the tulip and narcissus, of a considerable commerce to the Dutch. It is a native of the East, and abundant about Aleppo and Bagdat, where it flowersin February. It seems to have been first cultivated as a flower by the Dutch; but when is unknown. Most probably in the beginning of the sixteenth century, soon after the revival of commerce in the west of Europe, when the merchants of Holland traded to the eastern shores of the Mediterranean and the Archipelago. About the end of the sixteenth century there were seven or eight varieties known in England. In 1520 , Swertius, in his Florilegium, figured forty varieties; Miller says the Haarlem florists in his time (say 1720) had above 2000 varieties, and though the passion for this flower has greatly declined, they have still upwards of half that number. In England three or four hundred sorts are annually imported from the Dutch fiorists by the secdsmen.

A fine double hyacinth is cnaracterized by strength and enlargement of all the parts, and by bright distinct colors. The fundamental varieties are double, semidouble, single, red, white, purple, blue, and yellow, in mary different shades and variegations. A variety degenerates in a few years; but some have existed undeteriorated upwards of a century. Varieties are raised from seed, and flower the fourth or fifth year: their names are after the growers or their patrons, favorite friends, public characters, or the celebrated names of history and antiquity.
The seeds of the hyacinth are sown in October, after they have ripened, or in the following March. They remain three years with no other culture than covering with a little earth in autumn, but the fourth season they are transplanted into beds, where they remain two or three years longer till all the bulbs have fowered.

The soil is essentially a very sandy loam and vegetable mould; and if in forming the beds this soil can be made to the depth of two feet, and at the bottom of the bed a layer of six or nine inches of cow-dung

4874 Flowers campanulate half 6-cleft cylindrical at base
4875 Flowers funnel-shaped half 6-cleft ventricose at base
4876 Leaves linear channelled longer than scape

4877 Flowers cylindrical ovate uniform horizuntal subsessile
4878 Flowers camp. cylindrical half 6-cleft, Pedunc. in fruit very long and horizontal 4879 Flowers cylindrical angular on long stalks, the upper sterile on very long stalks

4880 Flowers campan, cylindrical, Limb erect shorter than tube, Leaves lin. lanc, erect
4881 Flowers globose uniform : the lower remote, Leaves linear upright channelled
4882 Flowers ovate uniform clustered: the upper sessile, Leaves lax dependent linear

4883 Flowers campanulate sessile, Inner sepals longer spreading obtuse, Leaves lin. Ianc. smooth
4884 Flowers campanulate sessile, Inner sepals longer spreading obtuse, Lvs. obl. lanc. with cartila. cren. edge 4885 Flowers campanulate sessile, Inner sepals longer spreading obt. Scape ang. at end short. than lin. obl. Ivs. 4886 Fl. campanulate sessile, Inner sepals longer spreading emarg. Lvs. lin. chann. lax twice as long as scape 4887 Fl. campan. sessile, Inner sepals longer spreading obov. obt. Lvs. lin. channelled lax longer than scape
4888 Fl. camp. cylind. on short stalks erect, Inner sep. long lanc. obt. erect, Lvs. lin. chann. lax long. than scape 4889 Flowers camp. stalked, Inner sepals longer obovate spreading, Lvs. lanc. channelled shorter than scape 4890 Fl. camp. stalked horizontal, Inner sep. longer obt. Stam. longer than f. Lvs. lanc. twice as short as scape 4891 Leaves two, Scape not longer than leaves, Fl. short horizontal, Stamens long declinate
4892 Leaves two oblong, Raceme compact, Flowers short campanulate nearly as long as stamens
4893 Leaves three lanceolate blistered shorter than scape, Flowers campanulate erect
4894 Flowers camp. on short stalks, Inner sep. Iong. obtuse, Scape 3 cornered reclinate, Leaves blistered
4895 Fl camp. stalked, Inner sep, long obt. revol. Stam. longer than fl. Scape angular at end, Leaves blistered 4896 Leaves two oval-edged, Flower erect conical shorter than spreading stamens
4897 Fl . camp. flat at base length of stalk, Inner sep. long. obt. Stam. longer than fl. Scape ang. at end, Lvs. obl. 4898 Leaves Janceolate erect unequal : the larger cucullate at base, Scape few-flowered shorter than leaves 4899 Lvs. lin. lanc. two-spreading, Flowers whole-colored with the outer sepals nearly as long as the inner 4900 Flowers cylindrical length of stalks, Inner sepals longer obtuse unequal, Leaf one lin, lanceol.
4901 Lvs, two lin. lanc. spreading, Fl. erect sessile clust. ovate with inner sep. much the narrowest and longest 4902 Flowers cylind. stalked, Sepals linear obtuse equal, Scape angular at end, Leaves lanc. deflexed 4903 Flowers cylind, stalked pendulous, Inner sepals longer emarginate, Leaves lanceolate
4904 Flowers cylind. stalked pendulous, Inner sepals longer emarginate spreading, Leaves obl. spreading 4905 Leaves twin obl, not spotted, Scape erect not spotted, Flowers cylindrical pendulous 4906 Flowers cylind, on short stalks pendulous, Inner sepals longest, Leaves oblong
4907 Leaves twin lin. lanc. spotted, Scape erect, Flowers pendulous with the inner limb of sepals spreading 4908 Flowers camp, stalked, Outer sepals long spreading : inner connate, Leaves long channelled

4961

and Miscellancous Particulars.
deposited, the plants will thrive the better. The season of planting is from the middle of Octover to the middle of November. The bed should be protected from heavy rains and severe frosts by the usual means; and about the beginning of April, whers the flowers begin to open, an awning of canvass should be fixed over them, to exclude all extremes of weather, and the more brilliant moments of sunshine. In three weeks or a month after blooming the bulbs should be taken up, unless they are intended to remain for seed. They should be dried in the shade, or under a few inches of dry earth, kept dry, and afterwards cleaned and wrapped up in separate papers, or laid on open airy shelves till wanted for replanting.
The hyacinth forces well, especially some of the blue sorts; it also does better than most bulbs when planted on water.
820. Zuccagnic. This plant was named in honor of Attili Zuccagni, superintendant of the garden at Florence. It is scarcely a different genus from Uropetalon.
821. Muscari. Something which smells of musk, called $\mu$ oowos in Greek, muscus in Latin, misk in Arabic. (Forskahl.) M. comosum,' $\beta$ monstrosum, is a most ornamental border flower. The bulb is large, ovate, and solid: the leaves narrow, a foot long, with obtuse points: the flower-stalks rise near a foot and a half high; they are naked at the bottom for about seven or eight inches, above which the panicles of fiowers begin, and terminate the stalks. The flowers stand upon peduncles which are more than an inch long, each sustaining three, four, or five flowers, whose petals are cut into slender filaments like hairs; they are of a purplish blue color, and, having neither stamina nor germ, never produce seeds. The other species are very pretty hardy flowers.
M. racemosum was named starch hyacinth by William Curtis, from the smell of the flower.
822. Lachenalia. So named in honor of Wernerus de la Chenal, of Switzerland, author of some medical and botanical tracts printed at Basle. The numerous species of this genus were chiefy introduced from the Cape by Masson : they bear a strong general resemblance, and are yet individually different; they may be styled diminutive, but pretty; they grow readily in sand and peat, and may be forced or retarded so as to Hower at almost any season. They must be very sparingly watered when not in a growing state.

4954 Cor. 6-cleft, Segments lanceolate revolute, Leaves ovate acute
4935 Cor. 4-cleft, Segments ovate, Leaves obovate

und Miscellancous Parlzculars.
with the bark of the root. The inner bark of the stems also will dye linen of a fine yellow, with the assist ance of alum. Kine, sheep, and goats are said to eat it; horses and swine to refuse it. This species varies with red, purple, pale yellow, and stoneless fruit.
Insects of various kinds are remarkably fond of the flowers of the barberry ; and the Feidium Berberidis, its particular inhabitant, is supposed to generate the dust which, carried from the bush by winds, and lighting on wheat and other growing corns, gives rise to the Puccinia, a minute fungus, which closes up the pores of the leaves, and appears like rust or mildew. (Sir J. Banks on Blight, \&c.) Many highly respectable authorities in Britain, on the continent, and in America, are in favor of and against this opinion. Willdenow, Withering, and Dwight have stated various remarkable cases on good authority. Sir J. Banks and his draughtsman Bauer proved the fact of the mildew being a fungus.

Linnæus observed, that when bees in search of honey touch the filaments, the anthers approximate to the stigma and explode the pollen. Sir J. Smith ascertained that the same effect is produced by touching the inside of the filaments with a small bit of stick. (Phil. Trans, vol. Ixxviii. 1. 158.)

All the other species are much esteemed as ornamental plants. B. aristata is a fine hardy evergreen shrub. B. ilicifolia and emarginata are also hardy, but less ornamental. B. fascicularis is a beautiful ornamental nearly hardy shrub, remarkable for its pinnated leaves.
830. Nandina. Nandin is the name of this shrub in Japan, where it is a garden shrub: the flowers are in panicles, and succeeded by berries of the size of a pea. In the greenhouse it grows freely in loam and peat, and ripened cuttings, with their leaves on, root in sand under a hand-glass.
831. Cossignia. Named by Commerson, after M. de Cossigny, a French naturalist, then living at Pondicherry Fine plants with handsome pinnated leaves.
832. Hillia. So named by Jacquin, in honor of Sir John Hill, author of many large works on botany and other parts of natural history, as well as general literature. Owing to some differences with his contemporaries, and writing against the Royal Society, after being rejected as a fellow, his memory in England has not met with much respect ; in truth it was but little that it deserved. The species are of easy'culture, and cuttings root readily in sand.

History, Use, Propagation, Culture,
833. Richardia. So named by Houston, after Richard Richardson, an English botanist. Cuttinge root in sand under a glass.
834. Canarina. That is to say, a plant native of the Canaries. This plant, Sweet observes, " is very desirable, as it flowers in autumn and winter, when few other plants are in bloom. After flowering, the stem lies down, and the roots continue dormant all the summer, when they need but little water. When they begin to grow they had better be placed in the stove, as they will not flower so abundantly in the greenhouse. A light loamy soil suits them best, or a mixture of loam and peat; and they are readily increased by dividing the roots, or from cuttings planted in the same kind of soil under a hand-glass " (Bot. Cult. p. 162.)
835. Frankenia. In honor of John Frankenius, professor of botany at Upsal, who first enumerated the plants of Sweden in Speculum Botanicum, 1638, and Speculum Botanicum Kenovatum in 1659.
836. Peplis. One of the Greek names of the Purslane. The plant now so called resembles the Purslane in some points.
837. Oryza. From the Arabic word êruz, the Greeks coined their word ogu $\zeta \alpha$, and the various modem nations of Europe their rice, rix, reis, \&c. O. sativa, the common rice, has the culm from one to six feet in length, annual, erect, simple, round, jointed. Leaves subulate-linear, refex, embracing, not fleshy. Flowers in a terminating panicle. Calycine leaflets lanceolate. Valves of the corolla equal in length; the inner valve even, awnless; the outer twice as wide, four-grooved, hispid, awned. Style single, two-parted.
O. mutica, the dry or mountain rice, cultivated in Ceylon, Java, and of late in Hungary, has the culm three feet high, and more slender. Fruit longish, with awns the longest of all. It is sown on mountains and in dry soils; rots with a long inundation, and perishes with sea water.

The varieties of rice, as of other cultivated grain, are as numerous as the different soils, climates, and other physical circumstances, in which it is cultivated : besides the dry rice, the chief sorts, by some considered species, are the $O$. præcox, or early rice, and the $O$. glutinosa, or clammy rice, both cultivated in irrigated lands.
The native place of rice, like that of the other sorts of grain in common use, is unknown; it is cultivated in great abundance all over India, where the country will admit of being flooded; in the southern provinces of China, in Cochinchina, Cambodia, Siam, Japan, \&c. In Japan it is very white, and of the best quality. It has also been introduced into cultivation in the southern kingdoms of Europe, Italy, Spain, the south of France, and within a few years into Hungary and Westphalia. In Carolina it has long been a staple commodity. Houghton's account of its introduction there is, that Ashby was encouraged to send a hundred pound bagfull of rice to that province, from which, in 1698, sixty tons were imported into England. Dalrymple says, that rice in Carolina is the result of a small bag of paddy, given as a present from Dubois, treasurer of the East India Company, to a Carolina trader. A Dutch vessel also, from Madagascar, brought rice into the same province; and to this is attributed their having two kinds. (Oriental Repertory, 1.)
In the hilly parts of Java, and in many of the Eastern islands, the mountain rice is planted upon the sides of hills, where no water but rain can come ; it is, however, planted in the beginning of the rainy season, and reaped in the beginning of the dry season. The natives call it Paddy Gunung, which signifies mountain rice. It is entirely unknown in the western parts of India, but it is well known in Cochinchina, where it thrives in dry light soils, mostly on the sides of hills, not requiring more moisture than the usual rains and dews supply, neither of which are frequent at the season of its vegetation.
There is a kind of hill rice which is hardy enough to grow on the edge of the Himalayan snows. It is almost to be expecter, that this will, at some future time, prove an acquisition of value to the European cultivator.

Rice is extensively cultivated in the East Indies and China, and chiefly on low grounds near large rivers,

4037 The only species, Leaves stalked hastate toothed

4938 Flowers solitary, Petals repand obtuse, Leaves linear ciliated at base
4939 Flowers fascicled, Petals acute, Leaves linear ciliated at base
4940 Flowers fascicled, Petals repand obtuse, Leaves linear oblong hairy at base
4941 Flowers solitary, Petals subrepand, Leaves roundish ovate powdery beneath
4942 Flowers hexandrous axillary solitary, Flowers stalked rounded ovate

DIGYNIA.

4943 The only species

and Miscellaneous Particulars.
which are liable to be annually inundated, and enriched by the deposition of mud. According to Sir George Staunton's account, the Chinese obtain two crops of rice in a year from the same ground, and cultivate it in this way from generation to generation on the same soil, and without any other manure than the mud deposited by the water of the river used in overflowing it. After the waters of the inundation have withdrawn, a few days are allowed for the mud to get partially dry; then a small spot is enclosed by a bank of clay slightly ploughed and harrowed, and the grain, previously steeped in dung, diluted with animal water, is then sown very thickly on it. A thin sheet of water is immediately brought over it, either by a led stream, or the chainpump. Thus a seed-bed or nursery is prepared, and, in the meantime, the remainder of the tract is preparing for being planted. When the plants are six or seven inches high, they are transplanted in furrows made by the plough, so as to stand about a foot apart every way; water is then brought over them, and kept on till the a sickle, threshed with a flail or the treading of cattle, and the husk taken field is quite dry. It is reaped with a sickle, threshed with a flail or the treading of cattle, and the husk taken off by beating it in a stone mortar, or passing it between two flat stones, as in a common meal mill. The first crop being cut in May, a second is immediately prepared for by burning the stubble, and this second crop ripens in October or November. After removal, the stubble is ploughed in, which is the only vegetable manure such lands can be said to receive from man. In Japan, Ceylon, and Java, according to Thunberg, Davis, and Raffles, aquatic rice is cultivated nearly in the same manner. Mountain-rice is grown much in the same way as our barley.
In Lombardy and Savoy rice is sown on rich lands, the sower often wading to the knees in water : one crop a year only is obtained; but four crops are often taken in succession. In America a similar practice obtains.
In Westphalia, and some other parts of the south of Germany, rice has long been cultivated; there it is sown on lands that admit of irrigation; but the water is not admitted till the seed has germinated, and it is the German rice taly, when the crop comes into fower. From long culture in a comparatively cold country, which has frequently been alluded to which has frequently been alluded to as an encouragement to the acclimating of exotics. It is found, Dr. Walker remarks (Essays on Nat. Hist.), that rice seeds direct from India will not ripen in Germany at all, and even that Italian or Spanish seeds are much less early and hardy than those ripened on the spot.
manner of our barley or summer-wheat. In
In England a crop of rice has been obtained near Windsor, on the banks of the Thames.
In the stove, or in a hot-bed, rice may be grown in pots of rich soil placed in pans of water, and in August grains.
By far the best imported rice is that from Carolina: it is larger and better tasted than that of India, which is small, meagre, and the grains frequently broken. As an article of diet, rice has been extolled as superior aimost to any other vegetable: but, whatever it may be in warmer climates, where it is a common, and to many persons almost their only food, it does not appear so well calculated for European constitutions as the potatoe; for we find that the poor constantly reject the use of rice when potatoes are to be had; and whilst these can be obtained, we may venture to predict, that rice will always be considered in this country, rather as a dainty, to be eaten with sweet condiments, spices, fruit, \&c. than as ordinary food. (Willich's Family
Cyclop.) 838. Atrap
838. Atraphaxis. A name given by the Greeks to the Atriplex of the Latins; derived from a privative, and glass; but the plants are of neither beauty nor curiosity.

History, Use, Propagation, Culture,
839. Flagellaria. From flagellum, a thong, in allusion to the length, toughness, and slenderness of its shoots.
840. Scheuchzeria. So named by Linnæus, in memory of the two brothers, John James Scheuchzer, professor of mathematics at Zurich, author of Itinera Alpina; and John, professor of physic at Zurich, author of a famous Treatise on Grasses. A curious little marsh plant.
841. Triglochin. From retis, three, and $\gamma \lambda \omega \alpha 15$, a point, in allusion to the three angles of the capsule AU domestic cattle are fond of the hardy species, which afford an early bite on the sides of Highland mountains, and are greedily eaten where they occur in salt marshes.
842. Lichtenstcinia. Named after M. Von Lichtenstein, a Prussian traveller at the Cape of Good Hope.
 leaves of the species and those of myrtle.
844. Tofieldia, Named by Hudson, after a Mr. Tofield, a country gentieman living near Doncaster.

## TRIGYNTA.

4946 A shrub with distichous branches, Leaves cirrhous at end
4947 A rushy aquatic plant

4948 Capsules 3-celled linear
4949 Capsules 3-celled smooth linear narrowed at end
4950 Capsules 6-celled ovate
4951 The only species, Sepals very narrow
4952 Leaves ovate cordate at base oblique
4053 Leaves alternate ovate-lanceolate
4954 Smooth, Flowers clustered in spikes, Sepals obtuse, Capsules oblong 4955 Scape rachis and leat-stalks downy all over

4956 Leaves lanceolate bearded at base, Stem 3-flowered, Sepals sessile
4957 Stemless, Leaves imbricated grassy, Flowers sessile
4958 Leaves linear subulate, the upper dilated at base, Spike wavy, Sepals with claws
4959 Leaves linear, Spike one-sided, Sepals with claws
4960 Leaves lin. lanc. longer than one-flowered stem, Sepals lanc. with claws
4961 Peduncles one-flowered cernuous
4962 Leaves whorled in the middle of stem, in threes at the summit
4963 Leaves of the stem setaceous
4964 Spike many-flowered longer than leaves, Tube twice as long as limb 4965 Leaves lanceolate channelled upright, Tube shorter than stellate limb 4966 Leaves lanceolate hooded

4967 Leaves oblong lanceolate cucullate
4968 Flower sessile erect, Potals lanceolate erect twice as long as calyx
4969 Flower sessile erect, Petals linear lanceolate erect a little longer than calyx
1970 Stalk of fower nearly erect, Petals oval-lanceolate acute recurved aloout twice as long as narrow calyx
4971 Stalk of flower erect, Petals oblong acute spreading a little longer than calyx
4972 Stalk of flower erect, Petals scarcely longer than calyx, Leaves oval oblong obtuse sessile
4973 Stalk of flower recurved, Petals lanceolate acuminate flat reflexed the length and breadth of calyx 4974 Stalk of flower inclining, Flower nodding, Petals scarcely longer but much broader than caly $x$

4975 Flower pendulous, Petals ovate with a short point, Leaves rounded rhomboid acuminate subsessite
1976 Flower cernuous, Petals spatulate-lanceolate erect at base much longer than calyx

845. Melanthium. A nanne applied by the Greeks to the Nigella of the Latins. What resemblance the modern plant bears to the ancient has not been stated.
846. Medeola. A name in remembrance of Medea, the famous sorceress, given to this plant on account of supposed powerful effects in medicine, but which it is now thought not to possess.
847. Xerophyllum. From $\xi \varepsilon \rho o s$, dry, and $\varphi u \lambda \lambda o v$, a leaf: its leaves appear as if withered. An American plant with a long spike of white flowers, resembling Helonias.
848. Wurmbea. So called by Thunberg, in gratitude for services rendered him at Batavia by one Wurmb, a Dutch agent there. Jussieu considers this not generically distinct from Melanthium.
849. Androcymbium. From aume avogos, a man, or, in botanical language, a stamen, and zu弓bos, a little boat, in allusion to the peculiar conformation of the stamens and their appendages.
850. Trillium. From trilix, triple; the calyx has three sepals, the corolla 3 petals, the pistil 3 styles, and the stem 3 leaves. These are curious little plants, somewhat difficult to keep. Sweet says they do best on a bed of peat, and may be increased, though slowly, by the division of the root or by seeds.

History, Use, Propagation, Culture,
851. Colchicum. From Colchıs, saith Dioscorides, where this plant grows in abundance; but it is probable that the term Colchicum was applied to all poisonous plants, among which this certainly held no inconsiderable place. The economy of this plant in regard to its bulbs, flowers, and seeds, is singular, and may be classed with other anomalies found in Crocus, \&c. The bulb, which in C, autumnale is about the shape and size of that of a tulip, is formed in the following manner : -

From the permanent, striated, dilated tuber of the old root, sinuated on one side, and clothed with the coats of the preceding root-leaves, a new plant springs, which is tuberous at the base, throws out fibres at bottom like other bulbs, and is received into the bosom of the former tuber, which embraces it half round. This has an outer radical spathe, which is cylindric and tubulas, cloven at top on one side, and half under ground. From two to six flowers half emerge from this spathe without leaves. In the mean time the fruits, much later than the flowers, sit on the stem rising out of the spathe. As the plant advances the new tuber increases, the old one, deprived of its nutriment, perishes, and at the same time the former pushes forth from its base the germ of a succeeding plant. There are commonly two lateral germs from the same tuber; one lower, just described, bearing the flower and seed; the other superior, caulescent like the former, but more slender, and scarcely floriferous.

The flowers, which arise with long slender tubes from the root, die off in the end of October, without leaving any external appearance of seeds. These lie buried all the winter within the bulb; in spring they grow up on a fruit-stalk, and are ripe about the time of hay-harvest. May not the very great length of the styles account in some measure for the delay in the ripening of the seeds? As this plant blossoms late in the year, and probably would not have time to ripen its seeds before winter, Providence has contrived its structure such, that it may be performed at a depth within the earth, out of the reach of the usual effects of frost; and as seeds buried at such a depth are known not to vegetate, a no less admirable provision is made to raise them above the surface when they are perfected, and to sow them at a proper season.

## 4977 Leaves flat lanceolate erect

4978 Leaves linear channelled erect, Styles shorter than flower
4980 Leaves wavy spreading
4981 Two or many-flowered, Sepals linear oblong obtuse, Leaves small oval grassy-green
4082 Leaves 4 glaucous spiral, Flowers small very dwarf, Style one
4983 Leaves appearing with flower linear much spreading
4984 Scape leafy, Leaves oblong lanceolate, Flowers diœcious
4985 Leaves lanceolate ensiform nerved, Bractes linear-lanceolate
4986 Scape leafy, Raceme oblong, Bractes short oblong, Leaves smooth lanceolate linear
4987 Leaves channelled nerved, Segments of flower broad ovate with a transverse nectary at base
4988 Root horizontal, Leaves lanc. erect, Bractes longer than flower, Nectaries distinct
4989 Scape leafy, Raceme showy lax, Bractes membranous, Leaves subulate setaceous very long
4990 Raceme oblong lax, Leaves very long and narrow, Caps, oblong
4991 Leaves grassy, Panicle loose, Segments of flower ovate acute
4992 Leaves very long narfow dry, Flowers racemose
4993 Leaves oval, Spike one cylindrical
4994 Spike bifid, Leaves linear oblong floating, Bractes entire
4995 Spike bifid, Leaves linear lanc. erect, Bractes bipartite
4996 The only species
8 1. Hermaphrodite. Valves marked with a grain.
4997 Valves cordate entire : one grained, Leaves ovate lanceolate
4998 Valves entire : one grained, Leaves cordate lanceolate
4999 Valves entire all grained, Leaves lanceolate wavy acute
5000 Valves ovate entire veinless all grained, Fruit-stalks pendulous, Leaves lanceolate
5001 Valves toothed all grained, Leaves lanceolate
5002 Valves trifid setaccous : one grained
5003 Valves toothed all grained, Leaves lanceolate
5004 Valves toothed grained, Leaves linear
5005 Valves lanceolate grained toothed at base, Leaves linear lanc. Whorls distant
5006 Valves toothed all grained, Leaves cordate-oblong obtuse pubescent
5007 Valves toothed all grained, Leaves cordate-oblong acuminate
5008 Valves toothed all grained, Leaves cordate oblong obtuse crenate
5009 Valves toothed: one grained, Radical leaves panduriform
5010 Valves rounded cordate repand : one grained, Leaves cordate oblong wavy at edge
5011 Valves oblong obtuse entire : one grained, Leaves lanceolate
5012 Valves entire lanceol. one grained, Leaves cordate lanceolate
5013 Valves entire lanceolate acute grained, Upper leaves linear-lanceolate

and Miscellaneous Particulars.
There are a few varieties of common Colchicum cultivated by florists; viz. the white, striped-flowered, striped-leaved, broad-leaved, many-flowered, and double-flowered. No cattle are said to eat it; though it is remarkably abundant in the meadows of the Italian Alps, and the leaves must certainly be frequently made into hay.

C, autumnale, as a medicine, has been known since the days of Hippocrates. It possesses diuretic, purgative, and narcotic properties : and on the continent, where it was recommended to notice by Baron Stoerck, it is a favorite remedy in dropsy, particularly hydrothorax, and in humoral asthma. But as it does not differ in its mode of action from squill, and is more uncertain in its operation, it has not been much used in that complaint in this country. In gout and rheumatism, however, its efficacy has been fully ascertained: and in allaying the pain it may be almost said to possess a specific property. It operates on the bowels chiefly, and the nerves, diminishing the action of the arterial system. (Thomson's Mav. Med. 257.)

All the species are ornamental as border-flowers, and may be blown in water-glasses.
852. Helonias. Derived from énos, a marsh. Some of the species grow in bogs in N. America. These plants delight in a moist situation and peat soil : they increase slowly by dividing at the root or by seeds.
853. Nolina. Named after an American botanist of French extraction, called P. C. Nolin. This plant is best grown in pots, as it requires protection during winter.
854. Aponogeton. A name of the same meaning as Potamogeton (see that genus), of which it is probably an incomplete anagram. These plants are bulbous aquatics, and grow freely in loam and peat plunged in a cistern of water. They are very pretty ornaments of the aquatium.
855. Sabal. A name employed by Adanson. It is supposed to have no meaning.
856. Rumex. A name given by the Latins to a root of thorn.
R. patientia (so called from the slowness of its operation as a medicine) and sanguineus, were formerly

History, Use, Propagation, Culture,
used as spinage plants. The former is still used on the continent, and mashed with a small proportion of $R$. acetosa or scutata, makes a very good spinage.
R. crispus has a fusiform yellow root, which, taken in a recent state, and bruised and made into an ointment or decoction, is said to cure the itch.
R. obtusifolius is a domestic weed of the worst description: it is found in every country of Europe, but almost confined to cultivated grounds or rubbish, rick-yards, neglected gardens, and places used as retiring grounds by men or cattle. It is never found on poor or wet-bottomed land. It is refused by cattle; but the leaves were formerly used for wrapping round butter and cream-cheese; and the roots, along with those of $R$ acutus, by the dyers. In powder, the roots of most docks are said to be one of the best articles for cleaning the teeth. The leaves of all of them are considered laxative rather than otberwise.
$\mathbf{R}$. acetosa has been long cultivated in gardens for its leaves as spinage and salad; but $\mathbf{R}$. scutatus is much more delicate. The Laplanders use the leaves of the $R$. acetosa to turn their milk sour: in Ireland they are eaten with fish and other alkalescent food. The root is powerfully astringent, and considered antiscorbutic: dried and boiled it gives out a beautiful red color. All domestic cattle eat this and most other species of the genus.
R. acetosella, where it abounds naturally, is a certain indication of dry, poor, gravelly, irony soil.
R. alpinus, monk's or bastard rhubarb, was formerly used as true rhubarb, but in larger doses.

The different species of Rumex attract the cultivator's attention as weeds more powerfully than as culinary, medicinal, or dying plants. The sorts vulgarly known as docks produce a large quantity of seeds, and ripen them rapidly and perfectly. Fortunately they are heavy, and are not carried to a great distance from the parent; but almost every one grows, and once a year old they are tedious and expensive to eradicate. The first season they may be destroyed by hoeing; but when the tap-root is established, unless it be wholly eradicated by the weeding, or dock-hook, or spade, the ground cannot be considered as cleared. Any part of the

root left will generate buds and send them to the surface, and if the plough or spade cut a root into pieces an inch long, each piece will grow, whether near the surface or buried to some depth. The less careful agriculturist often receives dock-seeds with his grass-seeds, brought from the stable-keepers and not properly cleaned : these come up the first year, and establish themselves along with the clover unobserved. The second year they flower, and if the crop is not early cut the seed ripens, and in using the hay is either mixed with the litter of the stable or with the hay-seeds, to be again carried to the field. Such as purchase town-manure cannot avoid receiving dock-seeds; but they may destroy them by fermenting the manure well before using it: others, who desire to get rid and keep clear of this weed, should be most particular in their choice of seeds of every kind, especially of grass-seeds; should weed them out as soon as they can be discovered; and, for such as remain till the second year, they may be pulled by hand when in the flower-stalk, and during or after a day's rain. (See Encyc. Agr. art. Peren. Weeds.)
857. Oxyria. From ogus, acid, in allusion to the qualities of its leaves. The plant is one of those singular individuals which has the character of two distinct genera, and yet is referable to neither. Wahlenberg made it a Rheum, Linnæus a Rumex, Mr. Brown what it now is, It was formerly used as a salad.
858. Wendlandia. Named in honor of J. C. Wendland, a German botanist. He has published various works upon plants, many of them illustrated with numerous colored figures. This is a climbing plant, referred by Decandolle to Cocculus.
859. Damasonium. From סoeroc, to take away or diminish. This plant had the reputation of removing the effects of the venom of the sea-dog. Handsome floating aquatics.
860. Actinocarpus. From azriy, a ray, and zugжos, fruit, in allusion to the radiate disposition of the little carpella round a common axis. Pretty floating aquatics.
861. Alisma. Derived from alis, water, in Celtic. Alisma Plantago grows in watery places, and is called water-plantain, from the resemblance between its leaf and that of the common plantain.

Class ViI.-HEptandria, 7 Stamens.

A small class, of which the Parinarium, which is a good tropical fruit, and the valuable Horse-chesnut, Fsculus, are the only remarkable genera. The Astranthus is a curious genus of the natural order of Homalineæ.

## Order 1. MONOGYNIA. 7 Stamens. 1 Style.

862 Trientalis. Cal. 7-leaved. Cor. 7-parted, equal, flat. Berry without juice.
863. Disandra. Cal. about 7-parted. Cor. rotate, 7-parted. Caps. 2celled, many-seeded.
864. Pisonia. Cal. campanulate, 5-cleft. Cor. O. Berry 1-celled, 1-seeded.
865. Petiveria. Cal. 4-leaved. Cor. O. Style lateral. Stigma pencil-shaped. Seed 1, with four retlexed awns at the end.
866. Esculus. Cal. 1-leaved, inflated. Cor. 4-5-petaled, unequal, pubescent, inserted in the calyx. Caps. 3-celled. Seeds large, chesnut-like.
867. Jonesia. Cal. 2-leaved. Cor, funnel-shaped, with a closed fleshy tube and 4-cleft limb. Nectary, a ring inserted in the throat of the tube. A Legumen.

## MONOGYNIA.

History, Use, Propagation, Culture,
862. Trientalis. From triens, the third of a thing; why so named we do not understand. Sir J. E. Smith says, "Few persons have seen the fruit of this plant, and it was most unaccountably mistaken, even by Linnæus and Gærtner. The valves of the ripe capsule become concave externally, convex and polished within, and have been taken for a permanent corolla. But they are opposite to the calyx leaves, which the segments of the corolla are not. The beautiful tunics of the seeds were supposed to be the skin of a dried berry, and are not faithfully represented by Gærtner. (English Flora, vol. ii. 208.)
863. Distudva. From $\delta u 5$, difficult, and avn¢ $\alpha \gamma \delta \rho 5$, a male, or, in botanical composition, a stamen; that is to say, a plant of which the stamens are subject to vary, and therefore difficult for botanists. A trailing plant with bright yellow flowers.
864. Pisonia. So named by Plumier, in honor of William Piso, a physician at Amsterdam, author of the Nutural History of Brazil, 1648 , fol. P. aculeata is an inclegant tree with round rechning spiny branches, wanting support. It is common in the savannahs and other low places in the island of Jamaica, and in

Order 3. TETRAGYN1A.
4 Stamens. 4 Styles.
872. Saururus. Cal. a spike of 1-flowered scales. Cor, O. Ovaries 4. Berries 4, 1-seeded.
873. Astranthus. Cal. O. Cor. hypocrateriform, with a 14 -cleft limb. Seed 1, small, superior.

Order 4. HEPTAGYNIA $\qquad$ 7 Stamens. 7 Styles.
874. Septas. Cal. 7-parted. Petals 7. Ovaries 7. Caps. 7, many seeded.

## MONOGYNIA.

5044 Leaves lanceolate entire
5045 Leaves narrow lanceolate acuminate oblique
5046 Leaves reniform crenate, Flower-stalks in pairs
5047 Spines axillary horizontal, Leaves ovate narrowed at each end, Corymbs axillary
5018 Unarmed, Leaves opposite acuminate narrowed into a short stalk very smooth fleshy
5049 Unarmed, Leaves opposite a little narrowed towards the base entire smooth, Lateral nerves parallel
5050 Unarmed, Leaves ovate acuminate, Flowers cymose erect, Fruit berried
5051 Unarmed, Leaves opposite acute scarcely narrowed at the base entire smooth with parallel nerves
5052 Leaves ovate entire villous, Flowers in umbels
5053 Leaves shining pointed (Lilac de Madagascar.)
5054 Leaves oblong acuminate smooth, Cymes compound, Flowers polygamous, Fruit spiny
5055 Flowers hexandrous
5056 Flowers octandrous
5057 Leaves digitate 7, Petals 5 spreading
5058 Leaves quinate smooth unequally toothed, Petals 4 with connivent claws the length of the calyx
5059 Leaves quinate pointed at each end downy beneath unequally toothed, Petals 4
5060 Leaves quinate beneath at the rib pubescent, Petals 4 with connivent claws longer than the calyx
5061 Leaves quinate quite smooth, Petals 4 spreading with claws the length of the calyx, Fruit spiny

and Miscellaneous Particulars.
several other islands in the West Indies, where it is very troublesome to whoever passes, fastening itself by its strong crooked thorns to the clothes; and the seeds being glutinous and burry, also fasten themselves to whatever touches them: so that the wings of the ground-doves and other birds, are often so loaded with the seeds, as to prevent their flying, by which means they become an easy prey.
865. Petiveria. So named by Plumier, in honor of James Petiver, apothecary of London, and fellow of the Royal Society, author of Museum, 1695; Gazophylacium, 1702, collected into one volume folio, with many plates. P. alliacea, is common in savannahs and woods in the West Indies, where it is a troublesome weed, and tastes the milk of cows that feed on it. It is so acrid, that on chewing a little, it burns the mouth and leaves the tongue black, dry, and rough, as it appears in a malignant fever. It is thought, however, to be coveted by Guinea-hens, and hence its vulgar name of Guinea-hen weed.
866. Esculus, or Fsculus, as Pliny writes it. A name which the Latins gave to a tree which furnished
them with an esculent nut: that plant was the Quereus Esculus of Lipnæus. Marronier, Fr., Marronien-

History，Use，Propagation，Cuiture，
banm，Ger．，and Marrone，Ital．丟．hippocastanum（intos，horse，horse－chesnut；because it was formerly a veterinary medicine）is a magnificent tree，at once grand from its magnitude and massy form，and beautiful when in blossom，from being covered with spikes of delicate white and pink flowers，protruding from among elegant digitate leaves．It is a rapid growing tree，and speedily produces a considerable bulk of timber，which，how－ ever，is of little value as such．The plant is best adapted for an ornamental tree in the outskirts of plantations， in avenues，or singly on lawns．It is much prized by the French as an ornamental avenue tree，and when the geometric style of gardening was in vogue in this country was a good deal planted，as at Bushy park，Canons， Castle Howard，\＆c．During the rage for the picturesque，it fell into disrepute from its＂compact lumpish parabolic form ；＂but the public are now convinced that there are other beauties besides those peculiarly adapted for representation by painters，and the taste for trees beautiful or interesting from their flowers， foliage，or other details，is now reviving．The nuts or capsules are large and mahogany colored，and have often occasioned regret that they are not edible，like those of the Spanish chesnut．Deer eat them greedily， and may be seen watching about the trees for their fall during windy weather．In Turkey they are grourd and mixed with horse provender．According to some，swine and sheep may be fattened on them，and poultry when they are boiled．They are of a saponaceous nature，and broken and steeped in hot water might save soap，where that article is excessively dear．This tree migrated from the northern parts of Asia into England by Constantinople，Vienna，Italy，and France．Parkinson in 1629 places it in his orchard as a fruit tree，and describes the nuts as superior to the ordinary sort．

E．Pavia was so named by Boerhaave，in honor of Peter Paw，a Dutchman，and professor of botany at Leyden，in 1601.

The other species have beautiful flowers，but are not free growing irees．

5062 Leaves 6-7-nate obov. acuminate 2-serrate, Petals 4 connivent with claws shorter than cal. Anth, smooth 5063 Leaves quinate, Petals spreading with claws shorter than calyx, Stam, twice as long as cor. Fruit spiny 5064 Leaves quinate, Petals 4, Stamens twice as long as corolla

5065 The only species
5066 Leaves supradecompound, pedate, Segments pinnatifid, Scape much shorter tnan leaf-stalks
5067 Leaves sagittate, Peduncles and petioles prickly
5068 Stem climbing, Leaves cordate ovate bored through
5069 Leaves sagittate cordate, Spathe cucullate, Spadix male upwards
5070 Leaves cordate, Spathe flat, Spadix hermaphrodite all over
5071 Leaves cordate acuminate, Spathe boat-shaped hiding the spadix
5072 Leaves ovate-oblong green above white beneath
5073 Leaves long oblong-lanceolate very white all over

DIGYNIA.
5074 Leaves oblong stalked

## TETRAGYNLA

5075 Leaves cordate stalked
5076 Leaves deeply cordate ovate-lanceolate shining
5077 Leaves cordate ovate acuminate shining nerved
5078 Leaves ovate lanceolate serrated

## HEPTAGYNIA.

5079 Leaves connate crenate roundish, Stem nearly leafless
5080 Floral-leaves 4 spatulate doubly crenate, Umbel compound
5081 Stem-leaves about two hooded and connate into a skreen, Flowers many minute

and Miscellaneous Particulars.
867. Jonesia. Named in honor of the famous Sir W. Jones, who to his other accomplishments added the knowledge of botany. The most fragrant tree of India. Large cuttings root well in sand under a handglass.
868. Dracontium. From $\delta \rho \alpha \% \omega y$, a dragon. The stems of some species are mottled like the skin of a snake. 869. Calla. A name of one of Pliny's plants, which probably was applied to something of the same natural order as that now called Calla.
870. Parinarium. The Guiana name of the genus is Parinari. Very fine trees with fine bunches of terminal flowers, which are succeeded by plum-like fruits, that in hot climates are esteemed and served up at table. It has been called Petrocarya by Schreber and other Linnæan botanists, who fancy science to depend upon names.
871. Limenm. An ancient name of a poisonous plant. It is derived from dos $\mu o s$, pest, poison. It was used, says Pliny, to poison arrows with. The plant to which modern botany has applied this name is a dangerous poison.
872. Saururus. From ravৎผ, a lizard, and век, a tail ; on account of its long and pyramidal tail, which may be compared to the tail of a lizard. Aquatic plants with neat foliage, but with no beauty in their flowers.
873. Astranthus. From $\alpha$ seoy, a star, and $\alpha y$, os, a flower, on account of the star-like disposition of the segments of the flower. A small Chinese bush with serrated leaves, and spikes of pale whitish green flowers.
874. Septas. From septem, seven. All the parts of the fower are in seven. Very neat little Cape plants, with umbels of white flowers.

## Ceass VIII. - OCTANDRIA. 8 Stamens.

This is a class, which, with reference to the plants which compose it, is of much consequence to the botanist and gardener. To the former it is recommended by the singular Melastomaceous plants which it contains, the curious Michauxia, and the Jeffersonia, remarkable for its capsule, which opens like a snuff-box. To the gardener it possesses irresistible attraction, not only in the delightful Tetrathecas, Boronias, and Correas of New Holland, in the Dimocarpus of China, celebrated for its truly excellent fruit, and in the Fuchsias, OEnotheras, Combretums, and Vacciniums, some of which form the pride of our hardy gardens; but also in the magnificent tribe of Heaths, which are certainly the most beautiful of plants under cultivation. This is abundantly attested by the splendid collections of Lee of Hammersmith, Rollison of Tooting, and last, but not least, of Loddiges of Hackney, where the precision of science is combined with the allurements of form and coloring.

Order 1. MONOGYNIA.

8 Stamens. 1 Style.

## 1 1. Ovary superior

875. Tropaolum. Cal. 1-leaved, 5-cleft, spurred. Petals 5, unequal. Nuts coriaceous, furrowed. Seed 1, roundish.
876. Roxburghia. Cal. 4-leaved. Petals 4. Nectary 4 lanceolate leaves inserted in the middle of the petals. Anthers 2, hanging down from the base of each nectarial leaf. Caps. 1-celled, 2 -valved, many seeded. Seeds on a spongy placenta.
877. Grislea. Cal. 4-cleft. Pet. 4, from the recesses of the calyx. Filaments very long, ascending. Capsule globose, f-celled, many-sceded,
878. Boronia. Cal. 4-cleft, persistent. Petals 4, ovate. Nect. coronate. Filam, ciliated, incurved. Stigma capitate. Caps. 4, 2valved. Seeds solitary, with an arillus.
879. Tetratheca. Cal, 4-cleft. Petals 4. Anthers 4-celled. Caps. 2celled, 5-valved: with valves bearing the septa in their middle. Seeds about 2.
880. Corraa. Cal, campanulate. Petals 4. Caps, 4-celled, opening with 4 valves. Cells $1-2$-seeded.
881. Mimusops. Cal. 4-leaved. Petals 4. Nectary 16-leaved. Drupe pointed.
882. Ornitrophe. Cal. 4-parted. Petals 4, bearded in the middle. Ovary double. Berries 2, I-seeded.
883. Dimocarpus. Sepals 5. Petals 5, reflexed, villous inside. Berries 2, one of which is often abortive, barked, tubercled, 1 -celled, 1 -seeded,
884. Melicocca. Cal. 3-parted. Petals 4, reflexed below the calyx. Stigma peltate. Drupe with a oark.
885. Blighza. Cal. 5-parted. Petals 5. Style very short. Stigmas 3. Seed solitary with a very large arillus.
886. Metaiba. Cal. 5-parted, Petals 5, with two scales at their base. Caps. oblong, 1-celled, 2 -seeded.
887. Kolreuteria. Sepals 5. Petals 4, irregular. Nect. 4 bifid scales. Caps. inflated, 3-celled, with 2-seeded cells.
888. Guarea. Cal. 4-toothed. Petals 4. Nectary cylindrical, bearing the anthers on the orifice. Caps. 4-celled, 4-valved. Seeds solitary.
889. Amyris. Cal 4-toothed. Petals 4, oblong, spreading. Stigma capitate. Berry drupaceous, by abortion 1 -seeded.
890. Ximenia. Cal. 4-cleft. Petals 4, hairy, revolute. Drupe 1-seeded.
891. Baeckia. Cal. 5-cleft. Petals 5. Caps. 3-4-celled, many-seeded, covered with the calyx. Seeds few.
892. Erica. Sepals 4, persistent. Cor. 4-cleft, persistent. Filaments inserted in the receptacle. Anthers
bifid. Caps. membranous, 4-8-celled.
893. Menziesia. Cal. 1-leaved. Cor. 1-petalous, ovate. Filam. inserted in the receptacle. Caps. 4-celled, with the septa from the inflexed edges of the valves. Seeds many, numerous.
894. Chlora. Sepals 8 or 10. Cor. 1-petalous, 8 -cleft. Caps. 1-celled, 2-valved, many-seeded.
895. Michaxia. Cal. many-cleft. Cor. rotate, 8 -10-parted, revolute. Nect. 8-valved, staminiferous. Caps. 8-10-celled, many-seeded.
896. Jeffersonia. Sepals 5, colored, deciduous. Petals 8, incurved spreading. Stamens surrounding the ovary. Caps. obovate, stipitate, 1-celled, opening below the end.
897. Dodonaa. Sepals 4. Cor. O. Filaments very short. Anth. oblong. Caps. 3-celled, 3-winged. Seeds 2.
898. Lawsonia. Cal, 4-cleft. Petals 4. Stamens in 4 pdirs. Caps. 4-celled, many-seeded, Seeds angular.

## § 2. Ovary inferior. <br> A. Seeds many.

899. Osbeckia. Cal. 4-cleft: its lobes separated by a fringed scale. Cor. of 4 or 5 -petals. Anthers rostrate. Caps. 4-5-celled, surrounded by the truncated tube of the calyx. Recept. compressed, half ovate.
900. Rhexia. Cal. urceolate, 4-5-cleft. Petals 4, inserted in the calyx, oblique. Anthers declinate. Caps. setose, 4 -celled, inside the calyx. Recept. lunate. Seeds numerous cochleate.
901. Enothera. Cal. tubular, 4-cleft, with deciduous deflexed segments. Petals 4, inserted in calyx. Stigma 4-cleft. Caps. 4-celled, 4-valved, inferior. Seeds naked, affixed to a 4-cornered central receptacle.
902. Gaura. Cal. 4-cleft, tubular. Petals 4, ascending towards the upper side. Nect. inferior, 1 -seeded.
903. Epilobium. Cal. 4-cleft, tubular. Petals 4. Caps, oblong, inferior. Seeds comose.
904. Fuchsia Cal. funnel-shaped, colored, deciduous. Petals 4, in the throat of calyx, alternate with its segments. Nectary an §-furrowed gland. Stigma capitate. Berry oblong, obtuse, 4-cornered, 4-celled,
905. Jambolifera. Cal. 4-toothed. Petals 4, funnel-shaped. Filaments flattish. Stigma simple, Fruit a 4-celled drupa.
906. Oxycoccus. Cal. 4-cleft. Cor, 4-parted, with linear revolute segments, Filaments conniving. Anthers tubular, 2parted. Berry many-seeded.
907. Vaccinium. Cor. urceolate or campanulate, 4-5-cleft, with retiexed segments. Filaments inserted on the ovary. Berry 4-5-celled, many-seeded.

## B. Seed one.

908. Memecylon. Cal, with a striated bottom, and an entire edge. Cor. 1-petalous. Anthers inserted on the side of the end of the filament. Berry crowned with the cylindrical calyx.
909. Lagetta. Cor. caducous, tubular, 4-toothed, with 4 petal-like glands. Drupe hairy, pisiform, 1 -seeded.
910. Daphne. Cor. 4-cleft, like a corolla, withering, including the stamens. Drupe 1 -seeded.
911. Dirca. Cor. tubular, with an obsolete limb. Stamens longer than tube. Berry l-seeded.
912. Gnidia. Cor. funnel-shaped, 4-cleft; with 4-8-petaloid scales at the orifice. Nut somewhat drupaceous.
913. Stellera. Cor. 4-cleft, inflated in middle. Stam. inserted in throat, very short. Nut 1, beaked.
914. Passerina. Cor. 4-cleft, naked. Style filiform, lateral, long. Stamens inserted on the tube. Nut 1, coated.
915. Lachncea. Flowers in heads. Cor. 4-cleft, with an unequal limb Filaments long, with an unequal insertion. Nut somewhat drupaceous.
916. Combretum. Cal. 4 toothed, campanulate, superior. Petals 4 , inserted in the calyx. Stamens very long. Caps. 4-angular, with membranous angles, 1-celled. Seed 1, oblong.

Order 2. DIGYNIA.

8 Stamens. 2 Styles.
917. Galenia. Cal. 4-cleft. Cor. O. Capsule roundish, 2seeded.
918. Aphananthe. Sepals 5. Two stamens opposite 2 sepals, 6 opposite and alternate with three other sepals.
919. Weinmannia. Sepals 4. Petals 4. Caps. 2-celled, 2beaked.
920. Möhringia. Sepals 4. Petals 4. Caps. 1-celled, 4-valved.

## Order 3. TRIGYNIA.

 8 Stamens. 3 Styles.

921, Polygonum. Cal. O. Cor. 5-parted, like a calyx. Seed 1, angular, covered. (Stamens and styles uncertain in number.)
922. Coccoloba. Cal. 5-parted, colored, finally becoming berried, Cor. O. Berry formed of the calyx, 1 -seeded.
923. Paullinia. Sepals 5. Petals 4. Nect. 4-leaved, unequal. Caps. turbinate, 3-cornered, 3-celled, with 1-seeded cells. Seeds with an arillus.
924. Serinna. Sepals 5. Petals 4. Nett. 4-leaved. Samaræ 3, longitudinally united, globose, connected downwards in a membranous wing.
925. Cardiospermum. Sepals 4. Petals 4. Nett. 4-leaved, unequal. Caps. 3, connate, inflated.
926. Sapindus. Sepals 4. Petals 4. Caps, fleshy, connate, ventricose.

## Order 4. TETRAGYN1A.

927. Verea. Sepals 4. Cor. hypocrateriform, 4-cleft, with acute segments, and a ventricose tube. Scales 4, at the base of the ovaries, linear. Capsules 4, 1-celled, many-seeded.
928. Bryophyllum. Sepals 4. Petals 4, connate into a cylinder. Seeds many.
929. Paris. Sepals 4 . Petals 4, narrower. Anth. attached to the middle of filament. Berry 4-celled.

930! Adowa. Cal. 2-3-cleft, inferior. Cor. 4-5-cleft, superior. Berry 1-celled, 4-5-seeded, united with the calyx.
931. Elative. Sepals 4. Petals 4. Caps. 4-celled, 4-valved, depressed, many seeded; the dissepiment opposite the sutures.
9:32. Haloragis. Sepals 4, superior. Petals 4, caducous, Drupe dry. Nut 4-celled.
933. Forshohlea. Cal, 4-leaved. Petals 8 spatulate. Seeds 4 enveloped in wool.

History，Use，Propagation，Culture，
875．Tropcolum．From tropaum，a trophy．The leaf resembles a buckler，and the fower an empty heimct， of which trophies were formed．T．majus is an ornamental annual，and also a culinary plant．The flowers are eaten in salads，and are very grateful：they are also used as a garnish．The seeds，which consist of three conjoined berries or nuts，with grooved wrinkled gibbous husks that become fungous when dry，are pickled in salt and vinegar，and used as a substitute for capers，to which some prefer them．In the evening the flowers emit spontaneously at certain intervals visible sparks like those of an electric machine．This was first observed by the daughter of Linnæus．
876．Roxburghia．In honor of William Roxburgh，M．D．born in Scotland，and settled in the East Indies； author of a splendid work on the plants of the coast of Coromandel．A singular plant，the natural affinities of which are yet obscure；it grows in loam and peat，and may be increased，though but slowly，by dividing at the root．

877．Grislea．So named after G．Grisley，a Portuguese surgeon，author of Viridarium Lusitanicum， 1661. A free flowering shrub of considerable beauty；it grows in loam and peat，and cuttings root in sand under a nand－glass in heat．
878．Boronia．So named after Francis Borone，an Italian servant of Dr．Sibthorp，who perished from an accident at Athens．Pretty little New Holland plants，generally with red flowers．These are valuable plants，as flowering neariy all the year．＂They thrive best in sandy peat，with the pots well drained with，broken potsherds． They may be propagated by layers or ripened cuttings，taken off at a joint and planted in sandy peat，and placed under a bell－glass，will strike root，if properly managed ：the glass must be taken off occasionally to dry them，as they are very liable to damp off：＂
879．Tetratheca．From $\tau \in \tau \rho \alpha$ ，four，and Anzm，a cell，in allusion to the four cells of the anthers，for which the plants are remarkable．Cuttings root in sand under a bell．glass．
880．Corraa．So named after Joseph Correa de Serra，a learned Portuguese，who，without publishing much， was one of the most profound theoretical botanists of this age．He died at Lisbon in 1823．＂Ripened cuttings

## MONOGYNIA.

5082 Leaves peltate repand mucronate, Petals acute
5083 Leaves peltate repand, Petals obtuse
5084 Leaves peltate 5-lobed palmate toothed, Petals jagged
5085 Leaves peltate, Lobes obtuse unequal, Flowers pinnate
5086 Leaves peltate 5 -lobed, Lobes obtuse repand, Petals cuneate toothed at end

5087 Leaves cordate many-nerved
5088 Leaves minute tomentose beneath, Corymbs axillary spreading

5089 Leaves linear lanceolate entire tomentose bencath
5090 Leaves pinnated with an odd one in 24-pairs very smooth, Leaflets linear acute, Pedunc. dichotomous 5091 Leaves simple trapeziform acute serrulate at end smooth

5092 Leaves alternate few lanceolate and branches smooth
5093 Leaves ovate downy beneath, Teeth of calyx small acute distant
5094 Leaves ovate obtuse beneath rusty with down, Flowers erect, Calyx truncate
5095 Leaves ovate-oblong cordate, Flowers pendulous, Calyx with 4 acute teeth
5096 Leaves alternate ovate acuminate
5097 Leaves alternate clustered at the ends of the branches oblong very obtuse
5098 Leaves alternate obovate emarginate, Flowers hexandrous

5099 Leaves ternate rough, Leaflets stalked ovate acuminate serrate, Racemes simple
5100 Leaves ternate, Leaflets stalked oblong narrowed at each end pubescent beneath, Racemes compound
5101 Leaves pinnated, Leaflets flat acute, Fruit scaly, Flowers apetalous
5102 Leaves pinnated, Leaflets rugose blunt, Fruit hispid, Flowers pentapetalous
5103 The only species
5104 The only species

> and Miscellaneous Particulars.
will root freely in sand under a bell or hand-glass. The cuttings must not be planted too thick, or they will be liable to damp. C. speciosa has generally been reckoned difficult to strike from cuttings, but it roots as freely as the others if properly managed, and requires the same treatment."
881. Mimusops. From $\mu \mu \rho 5$, an ape, and a $\% 15$, figure. The flowers are thought to resemble the countenance of a monkey. Ripened cuttings root readily in sand under a hand-glass.
882. Ornitrophe. From ogyss, a bird, and $\tau \rho \circ \phi n$, nourishment. Its fruit is much eaten by small birds. In the Isle de France it is called bois de merle, or thrush-wood. Cuttings root in sand under a hand-glass.
883. Dimocarpus. From $\delta, \delta \nu \mu \circ 5$, double, and zuৎло5, fruit; its fruit grows in pairs. These are fruit-bearing trees, cultivated in China. The fruit is a berry in bunches of a red color, and rather larger than the grape. The bunches are small; the skin of the berry is tough and leathery; the pulp is colorless, semitransparent, and of a slightly sweet subacid taste. The fruit of $D$. Litchi is frequently brought to England dried like raisins; that of D. Longan has been ripened by John Knight, Esq. of Lee Castle, in a lofty stove, erected for the purpose of growing tropical fruits. A bunch was presented to the Horticultural Society, in September 1816, "supposed to be the only one ever produced in Europe, and which persons well acquainted with the long-yen in its native places of growth, pronounced to be quite as good as those grown within or near the tropics." (Hort. Trans. ii. 408.)
884, Melicocca. From $\mu_{\varepsilon} \lambda_{1}$, honey, and zozzos, fruit; its fruit, which resembles the yolk of an egg, has a very sweet flavour mixed with a little acid. This tree is cultivated in some parts of South America and in Jamaica for its fruit, which grows to the size of a large plum, and is very mellow. The natives suck it for the sake of the salivation which it produces. In our stoves it thrives well in light loamy soil, and cuttings root in sand under a hand-glass in heat.
885. Blighia. Named in honor of the famous Captain Bligh, who first carried the bread-fruit to the West Indies. This is an esteemed African frutit tree with a reddish or yellow pome, about the size of a goose's egg,

History，Use，Propagation，Culture，
with the arillus of the seed of a grateful subacid flavor．In the West Indies it is esteemed very wholesome and nourishing．Here it grows well in loam and peat，and ripened cuttings with all their leaves on root best in sand under a hand－glass．
886．Metaiba．The vernacular narne of the plant in French Guiana．Large cuttings root best under a hand－glass in sand．
887．Kölreuteria．So named by Laxmann，in honor of Joseph Gottlieb Kblreuter，who published De plantis quibusdam Rarioribus，Tubing，1755，with a dissertation De Insectis Coleopteris．He also made many experi－ ments on the pollen of flowers，hybrid plants，\＆c．published in the Petersburgh Transactions．
This shrub should be planted in as sheltered a situation as possible，as it will not flower if too much ex－ posed；and if the wood is not well ripened，the tops of the shoots will be injured by the frost．
888．Guarea．The natives of Cuba call the plant Guara．This tree，though it has an inconspicuous flower， yet has fine large leaves．All parts of the plant，especially the bark，smell strong of musk，and may be used instead of that perfume for many purposes．The wood is full of a bitter resinous substance，which renders it unfit for rum－hogsheads，being observed to communicate both its smell and taste to all spirituous liquors： but it is often cut for staves and heading，when there is a scarcity of other timber．The powder of the bark is said to be a good emetic；and is sometimes used among the negroes for that purpose．Ripened cuttings root in sand under a hand－glass．
889．Amyris．Derived from $\mu v \rho \dot{p} \kappa$ ，myrrh．Its resinous gum has an excellent perfume．Almost every species of this genus produces some valuable gum or resin．A．gileadensis produces the celebrated balm of Gilead．It is a shrub with purplish branches，striated a little，with crowded ternate leaves，and protuberant buds loaded with balsamic resin．

5105 Leaves alternate abruptly pinnated in $2-3$ or 4 pairs

5106 The only species. Leaves pinnated toothed torn
5107 Stalks of the leaves short tumid inflated
5108 Leaves simple lanceolate entire, Racemes simple axillary numerous
5109 L.eaves ternate crenate acute

## 5110 Peduncles many-flowered, The lower usually changed into spines

## 5111 Leaves opposite beardless, Teeth of calyx membranous colored

5112 Leaves linear lanceolate, Peduncles axillary umbelled
5113 Leaves imbricated four ways obtuse with a little reflexed point, Teeth of calyx leafy

## A. Tubiflore. Corollas long and cylindrical.

5114 Stamens long connivent colored, Leaves in threes, Calyx imbricated, Bractes distant from calyx 5115 Stamens long connivent colored, Leaves in threes, Calyx imbricated, Flowers solitary, Cor. cylindrical 5116 Stamens long connivent colored, Leaves in threes, Calyx imbricated, Segments of cor. reflexed 5117 Stamens long connivent colored, Lvs. in 3s, Cal. imbricated, FL 3, Cor. globose scarcely longer than cal.

5118 Stamens long connivent colored, Leaves in threes, Calyx imbricated, Flowers solitary, Cor. conical
5119 Anth. bearded, Style incl. Cor. cylind. contracted above the base, Fl. pend. Leaves 4 whorled
5190 Stamens long connivent colored, Leaves in threes, Cal. imbricated, Flowers 3, Cor, cylindrical incurved
5121 Anthers bearded, Leaves in threes, Flowers terminal solitary
5122 Stamens exserted colored, Leaves in 3s, Cal. imbricated, Flowers 3, Cor. conical, Leaves recurved
$51 \varrho 3$ Anth, bearded incl. Style exsert. Cor. tubular clavate pubes. Fl. axill. Leaves 3 imbricated
5124 Anthers beardless exserted, Cor. incurved smooth, Style long, Flowers axillary stalked, Lvs. 6 smooth
5125 Anth. beardless included, Style exserted, Cor. tubular clavate, Cal, pubescent, Fl. capitate, Leaves 6
5126 Ant. beard. includ. Style exsert. Cor, tub. incurv. Cal, simple gland, tooth. Fl. axill. whorl. Lvs. 3 rough
5127 Anthers beardless, Lvs. 3, Flowers solitary or 3 term. Cal. imbric. Cor. villous
5128 Cor. cylind. Anthers bearded, Lvs. 3, FL term, 3, Cal. imbric. Style exserted rounded at end
5129 Anthers beardless, Lvs, 4, Fl. term. Bractes ovate distant from cal. Sepals ovate acumin.
5130 Anthers bearded included, Style exserted, Cor. tubul. clav. Cal. double, Fl. term, 3, Lvs. 3 smooth
5131 Anthers beardless, Leaves 3 smooth, FL 3 term. Cal. imbric. Corolla smooth
5132 Anth. bearded, Style incl. Cor. cylind, ventric. Flowers umbelled capitate, Lvs, 8 linear truncate

5133 Anth. beardless exserted, Cor. tub. clavate pubescent, Fl. term. racemose, Leaves 5 or more smooth 5134 Anth. bearded, Style includ. Cor, clav. cylind. Flow. umbell. Lvs. 6 linear reflexed
5135 Anth. beardless included, Style exserted, Cor. ventricose at base, Fi. term. Lvs. 4 pubescent erect 5136 Anth. bearded, Lvs. 4-6, F1. axill. Cal. imbr. Bract lanc. Sepals broad lanceol.
5137 Anth. beardless, Lvs. 4 ciliated, Fl. term. Two bractes next cal. one distant, Cor, smooth

and Miscellaneous Particulars.
A. Opobalsamum produces the balsam of Mecca. It has pinnate leaves, with sessile leaflets. It grows near Bederhunin, a village between Mecca and Medina, in a sandy rocky soil, confined to a small tract about a mile in length, and attains the height of fifteen feet. The balsam is obtained by incision. Neither of these species are yet introduced to Britain: those we possess grow in loam and peat, and cuttings root freely in a pot of sand under a hand-glass.
890. Ximenia. Francis Ximenes was a Spanish naturalist from whom we have, published in 1615, four works upon the plants and animals useful in medicine in New Spain. The flowers of this tree have an odor like frankincense : the fruit is yellow, shiny, the size of a pigeon's egg, with a thin rind and sweet subacid pulp; it is eaten by negroes and children in the West Indies. Cuttings ront in sand under a hand-glass.
891. Backia. From Abraham Back, who was physician in ordinary to the king of Sweden, and who communicated plants to Linnæus, by whom the genus was dedicated. These plants are of free growth in sandy loam and peat, and so hardy as to require little more than protection from frost during winter. Young cuttings root in sand under a bell-glass.
892. Erica. From eŋswa, to break, in allusion to the brittle branches of the plant. It was also reputed a specific for breaking the stone in the bladder. La bruyère, Fr., Heide, Ger., Erica, Ital, and Brexo, Span. Ling or common heath abounds in barren wastes in every part of Europe, and especially in the northern countries. Though little regarded in warm climates, the different species of native Erica are made subservient to a great variety of purposes in the bleak and barren highlands of Scotland, and other northorn countries. The poorer inhabitants cover their cabins with them instead of thatch, or else twist them into ropes, and bind down the thatch with them in a kind of lattice work. They also make the walls with alternate layprs of heath, and a sort of cement made of black earth and straw. The hardy Highlanders frequently

History，Use，Propagation，Culture，
make their beds with it．In most of the western isles they dye their yarn of a yellow color，by boiling it in water with the green tops and flowers of this plant；and woollen cloth boiled in alum water，and afterwards in a strong decoction of the tops，comes out a tine orange color．In some of these islands they tan their leather in a strong decoction of it．Formerly the young tops are said to have been used alone to brew a kind of ale； ale with one part malt，and two parts of the used by the Picts．In some of the isles it is said they still brew ale with one part malt，and two parts of the young tops of heath，sometimes adding hops．In many parts of Great Britain besoms are made of it．The turf，with the heath growing on it，is cut up and dried for the fuei of the cottager，for heating ovens，covering under－ground drains，\＆cc．Sheep and goats will sometimes eat the tender shoots，but they are not fond of them．Cattle not accustomed to browse on heath give bloody

## 5138 Anth. bearded, Lvs, 4-6, F1. axill. Cal. imbr. Scpals orbicular obovate

5139 Anthers hearded, Lvs. 4-6, Flow. axillary, Cal. imbric. Sepals rhomboid with long claws
5140 Anth. beardless, Leaves 4 3-cornered ciliated, Flowers terminal subsolitary
5141 Anthers included bearded, Cal. leafy, Leaves 4 hairy, Flowers terminal, Style exserted
5142 Anthers beardless included, Lvs. 3-4, Flowers terminal few, Cal. imbr. Cor, pubescent
5143 Anthers bearded, Lvs. 4-6, Fl axillary, Cal. imbric. Sepals subulate from a broad base
5144 Anth. beardless, Lvs. 4 linear glandular hairy, Cor. clavate, Cal. hispid
5145 Anthers bearded, Style incl. Cor. cylind. Sepals membran. Fl. axill. whorl. Lvs. 4 lin. smooth
5146 Anth. beardless, Lvs. 4, FL. term. 4 closely packed in a 4 -cornered head, Sep. lin.subul Ped. very short 5147 Anthers beardless, Flowers solitary or 3, Cal. imbric. Cor. villous
5148 Anthers beardless, Flowers 3, Cal. imbricated, Cor. smooth, Leaves pubescent
5149 Anth. beardless exserted, Ovary turbinate, Lvs. 4-6, Fl. axillary, Two bractes close to cal. one remote
5150 Anthers beardless exserted, Lvs. 4-6, Flowers axill. Bractes remote, Ovary with 8 furrows smooth
5151 Anthers beardless included, Bractes next calyx, Cor. hairy solitary, Leaves 4 hairy
5152 Anthers exserted gibbous at base, Bractes remote, Cal. leafy, Lvs, 4, Branches hairy, Fl. terminal
5153 Anthers beardless, Lvs. 4, Bractes a little distant from cal. Sepals oblong revolute at edge
5154 Anthers beardless exserted, Lvs 4, Bractes linear distant from cal. Sepals ovate acuminate
5155 Anth. beardless, Lvs, 4-6, F1. axill. Two bractes next cal. one remote, Ovary cylind. Cor. pubescent viscid
5156 Anthers beardless included, Lvs, 4, Fl. term few, Bractes lin. remote, Sepals ovate acuminate
5157 Anthers beardless, Lvs. 4-6, Fl. axill. Two bractes next cal. one remote, Ovary cylind. Cor, smooth viscid
5158 Anthers beardless included, Lvs, 4, Fl. term. few, Bractes remote, Sepals ovate obtuse
5159 Anth, beardless, Cor. curved clavate smooth, Fl. solitary term. Leaves 4 linear smocth
5160 Anth. beardless included, Cal. leafy imbricated, Leaves 3 smooth spreading, Style exserted
5161 Anth. beardless exserted, Cor. cylind. ovate, Sepal col, obl. obt. Leaves 3 appressed erect, F1, 3 terminal
5162 Anth. beardless included, Cor, cylindrical narrowed at base, Fl. term. umbell. Leaves 6 smooth
5163 Anth. beardiess, Lvs. 4, Fl. term. 4 closely packed in 4 -cornered head, Sepals lin. subul. Ped. length of $f$. 5164 Anth. beardless, Leaves 4, Fl. term. 4 closely packed in a 4 -cornered head, Sepals lanceolate
5155 A handsome species with tufted hairy leaves. It resembles E. linnæana
5166 Anth. beardless, Leaves 4, Fl. term. 4 closely packed in a 4-cornered head, Sepals ovate roundish
51 ti7 Anth. beardless, Leaves 4, Fl. axillary, Cor. ribbed, Bractes nearly as long as calyx
5168 Anth. beardless included, Leaves 6 ciliated, Flowers terminal, Cor. clavate at first white afterwards red
5169 Anth. beardless, Lvs. 4-6, Fl. axillary, Cor. ribbed cylind. with a spreading limb, Bractes $\frac{1}{2}$ length of cal.
5170 Anth. beardless, Lvs. 4-6, Fl. axill. Cor, ribbed widest in middle with a revol. limb, Bractes length of cal.
5171 Leaves spreading smooth, Flowers clavate incurved smooth
5172 Anth. beardless, Leaves 4-6, Fl. axillary, Cor. not ribbed, Sepals linear
5173 Anth, beardless, Leaves 4.6, Fl. axillary, Cor, not ribbed, Sepals from a broad base linear subulate
5174 Anth. beardless, Leaves 4-6, Fl. axillary, Cor, not ribbed, Sepals ovate acuminate
5175 Leaves upright smooth, Fl. term. 4 turbinate hairy
5176 Anth. includ. beardless, Bractes remote from flower, Leaves very short imbricated
5177 Leaves 3 smooth spreading distant, F1. axillary pendulous cylindrical smooth
5178 Anth. beardless included, Leaves 4-6, Fl. axill. '1wo bractes next cal. : one remote, Ovary turbinate
5179 Leaves 4 hairy clammy, Fl, cylindrical terminal curved smooth, Style exserted
5180 Anth. heardless, Leaves 4-6 hairy, Fl. axill. Two bractes next cal. : one remote, Ovary clavate 5181 Leaves short with long hairs, Fl. large axillary pendulous cylindrical with a green mouth
5182 Anth. bearded, Leaves 3 ovate rough, Fl. 3 cernuous smooth, Cal, villous colored
5183 Anth. beardless exserted, Leaves 4-6, Fl. axill. Bractes remote, Ovary with 4 furrows smooth
5184 Anth, beardless included, Lvs. 4-6, FI. axill. Bractes remote, Limb of cor, revolute, Ovary with 8 furrows
[silky upwards

5185 Anth. beardless included, Leaves 4-6, Fl. axill. Bractes remote, Limb of cor, erect spreading 5186 Anth. beardless exserted, Leaves 3, Fl. terminal numerous, Bractes remote
5187 Anth. beardless included, Leaves 3 hairy, Fl. capitate, Cal. imbr. Cor, very hairy
5188 Anth. beardless, Leaves 4 triangular smooth, Fl. term, cylindr. smooth

and Miscellaneous Particulars.
milk, but are soon cured by drinking plentifully of water. The branches of heath afford shelter, and the seeds a principal part of their food to many birds, especially those of the grouse kind: and for this purpose the seedvessel is formed and protected in such a manner, that the seeds are preserved a whole year, or even longer. Bees collect largely from the fowers, and honey made from them was anciently supposed to be of a bad quality, but in fact it is only of a darker color. The foliage affords nourisbment to the Phalæna quercus or great egger moth. Dodder frequently entwines itself about this plant, and gives it a singular appearance.
Till the latter end of the last century, this genus consisted of three or four humble British shrubs, and the heath of Spain (E. mediterranca), a slow growing tree. But when the Cape of Good Hope fell into the hands of the British, collectors were sent out, and soon brought to light some hundreds of species. It may serve as

History，Use，Propagation，Culture，
an easily recollected date，to say that all of them were sent home during the reign of George III．，and as a tribute to merit，that most of them were gathered by Mr．Francis Masson．Their beauty needs no encomium； many are pretty，some are graceful or elegant，a few splendid，and there are curious，grotesque，and odori－ ferous species．Their culture and propagation is one of the most delicate branches of the art of gardening： it may be said to have been invented in England，and in the Hammersmith nursery，and places Britain far before all countries in this art as in so many others．

The only soil in which heaths will grow is earth of peat：if any substitute can be found，it is in leaf－mould

## B. Ventricose. Corolla inflated.

5189 Anthers bearded, Bractes oblong next cal. Cor. twice as long as calyx
5190 Anthers bearded, Bractes ovate next cal. Cor. 4-cleft thrice as long as calyx
5191 Anthers bearded, Bractes ovate next cal. Cor. 4-parted scarcely twice as long as calyx
5192 Anthers bearded included, Cal. leafy, Bractes remote from fl, Leaves 4 spreading smooth
5193 Anthers beardless, Flowers terminal, Two bractes next fl. : one remote, Cor. viscid-hairy
5194 Cal. rhomboid-spatulate, Cor. woolly inside, Leaves narrow-ovate cuneate pectinate
5195 Anth. beardless, F1. term. Two bractes next f. : one remote, Cor, smooth, Sepals lin, lanceolate 5196 Anth. bearded, Two bractes next fl. ; one remote, Leaves 6, Beards of anth. very short 5197 Anth. bearded, Bractes remote, Leaves 4 smooth, Beards of anth. very long
5198 Anth. beardless, FI. term. 8, Bractes remote, Leaves 4, Sepals terminated.by 3 or more bristles 5199 Anth. beardless, Fl. term. Two bractes next cal. ; one remote, Cor. smooth, Sepals ovate acuminate 5200 Pubescent, Two subul. bractes next cal. Leaves decussate 4, Cor. villous many times longer than calyx 5201 Cal. minutely ciliated, Tube narrow-cylindrical urceolate, Anthers beardless
5202 Anth. beardless, Fl. term. 4, Cal. imbric. Sepals ovate oblong acute, Leaves recurved ciliated 5203 Anth. beardless, Fl. term. many, Cal. imbric. Leaves recurved terminated by a bristle
C. Limbate. Corolla elongated, narrowed upwards, with a flat limb.

5204 Anth. beardless, Leaves ciliated and fowers 4, Sepals subulate, Stigma exserted
5205 Anth. bearded, Bractes remote, Leaves 4 ciliated, Beards of anth. very short
5206 Anth. bearded included, Leaves 4 ciliated, Fl. capitate, Bractes remote
5207 Anth. bearded included, Cor. globose ovate, Leaves opposite and scattered fringed with glands ,inear
5208 Anth. beardless, Fl. terminal 3, Leaves 3, Bractes remote, Sepals subulate, Cor. 4-cornered 5209 Anth. included beardless, Fi. umbelled, Bractes remote
5210 Anth. beardless, Fl. term. S, Leaves 3, Bractes remote, Sepals ovate oblong
5211 Anth. beardless, Fl. term. 4, Leaves 4, Bractes remote
5212 Flowers long conical striped, with a flat limb, The whole surface of corolla shining
5213 Anth. beardless, Fi. term 8, Leaves 4, Bractes remote, Sepals terminated by a long bristle
5214 Anth. beardless, Fl. term. 4, Cal. imbricated, Sepals from a broad base, subulate, entire
5215 Anth. beardless, FI. term. Leaves 4 smooth, Cor. slender, Style included
5216 Anth. beardless, Fl. term. 4, Cal. imbricated, Sepals ovate acuminate serrulate
5217 Anth. beardless included, Flowers farcicled, Style included, Leaves 4
5218 Anth. included beardless, I,eaves 4 smooth erect, F1, term. Cal, imbricated leafy
5219 Anth. beardless, Leaves 3, Fl. term. F1. 3, Bractes remote, Cor, viscid
5220 Anth. bearded, Style included, Flowers terminal, Leaves lin. 2 smooth, Branches deflexed
5221 Anth. beardless included, Style included, Leaves 4, Flowers clustered

5222 Anth. beardless, Cor. somewhat 4-cornered, Sepals lanceolate entire, Fl. term. sessile, Leaves 4 smooth 5223 Cal. ovate cuspidate scarcely serrated, Cor. three lines long, Limb twice as short as tube recurved 5224 Leaves 4 spreading, Fl. 4 terminal
5225 Leaves 4 erect, Fl. simple on little axillary branches, Cor. ovate
5226 Leaves 3 smooth erect imbricated, Fl. 3 terminal, Cor. hypocrateriform, Tube slender
5227 Anth. beardless included, Sepals membranous ciliate toothed, Fl. term. sessile, Leaves 4 smooth
5228 Anth. beardless included, Leaves 4-6, Fl. axill. Bractes remote, Lirab of cor. revolute, Ovary smooth
5229 Anth. beardless, Fl. terminal, Cal. imbricated, Fl. 4. Sepals oblong obtuse, Leaves recurved setose
5230 Anth. beardless, Flowers terminal subsessile 5, Bractes next calyx, Leaves spreading 5
5231 Leaves short erect, imbricated, Flowers terminal solitary, Tube ovate, Limb recurved
5232 Leaves 3 filiform spreading, Fl. 3 term, rotate, Stamens and styles exserted
5233 Leaves dense acerose smooth erect, Fl, axillary, Tube cylindrical
5234 Leaves densely imbricated erect, Flowers large axillary, Petals sawed
5235 Leaves dense spreading, FI, 4 terminal, Tube ovate longer than limb
5236 Leaves 4 narrow erect smooth, Flowers terminal 4 very numerous, Tube ventricose
D. Calycins. Corolla inclosed in the inflated calyx.

5237 Anthers crested, Cor. ovate, Style included, Cal. turbinate, Leaves 3, Flowers umbelled
5238 Anthers crested, Bracteas remote, Leaves 3 much longer than the joints green
5239 Anth. crested, Leaves 3, Cal. imbricated, Style included, Flowers terminal, numerous 5240 Anth. crested, Leaves 3 , Cal. imbricated, Style included, Flowers terminal three

sifted very fine and mixed with fine sand. Earth of peat is obtained by collecting peats from bogs or turf from the surface of peaty wastes and moist places, and laying the peats or turves in a heap to rot and moulder into earth. This they will require several years to do; but in the meanwhile a portion of mould may be obtained whenever it is wanted, by turning the turves and sifting the fragments. Sometimes this peat is found without any mixture of sand; at other times, where streams have run into the bog or lake while the peat was forming, it is mixed with fine sand that had been held suspended in the water. This last is the best sort of peat for the Erica family; and therefore where peat is not sandy naturally, fine white sand

[^3]or sand of any color，provided it be free from irony impregnation，should be procured and mixed with it． This sand admits the water to penetrate into the soil and reach the roots of the plant，and also to drain away from the roots so as not to rot them．Pots filled with pure peat－earth are apt to be either hard，dry，and im－ penetrable to water，or otherwise as wet as a saturated sponge．The free growing kinds（according to Sweet） thrive best in good black peat，and like largish pots to grow in．The dwarf and hard－wooded kinds like a very sandy peat，and smaller pot，well drained with broken potsherds and rough bits of turfy peat；they also require less water than the free growing kinds，as they grow chiefly at the Cape on the tops and sides of moun－ tains，and in the crevices of rocks，\＆c．chiefly in very sandy soil，and but little of it．

#### Abstract

5241 Anth. crested, Leaves 3, Cal. imbricated, Sepals carinate, Flowers terminal three, Style included 5242 Anth. beardless, Leaves 3 lanceolate smooth, F1. umbelled surrounded by colored bractes 5243 Anthers crested, Leaves 3 mucronate smooth with a white edge, Sepals lanceolate, Flowers terminal 5244 Anthers bearded, Leaves 3 oval imbricated, Flowers capitate 5245 Anthers bearded, Leaves 3 smooth, Cor, campanulate, Style included, Flowers 3 sessile 5246 Anthers bearded, Leaves 4, Appendages subulate pectinate longer than the anther 5247 Anthers bearded, Style included, Cor, ovate 4-cornered, Fl. terminal 3, Leaves 3 or 4, Stem pubescent 5248 Leaves long ciliated spreading, Fl. axill. Cor. cylindxical, Cal. with keeled sepals 5249 Anth. bearded included, Style included, Cor. campan. Fl. axill nodding, Leaves 3 imbricated 6 ways 5250 Anth. beardless exserted, Style exserted, Cor. campan. Fl. terminal capitate, Leaves 4 -incurved ciliated 5251 Anth. beardless included, Cor. and calyx scarlet, Leaves opposite 5252 Anth. beardless, Cor. flat, Tube globose, Style exserted, Leaves 3 5253 Anth. beardless included, Cor. ovate, Flowers in umbelled corymbs, Lvs. 3 triangular cartilagin. at edge 5254 Anthers beardless exserted, Style exserted, Cor, campanulate, Flowers 3 terminal, Lvs, 3 lanc. smooth 5255 Anthers beardless exserted, Cor. campanulate, Cal, imbricated, Style exserted, Leaves 3 5256 Anthers much exserted beardless, Cor. campanulate length of the very hairy calyx, Leaves spreading 5257 Anthers much exserted beardless, Cor, campanulate longer than the very hairy calyx, Leaves erect 5258 Anthers beardless included, Cor. globose campan. Cal. woolly, Flowers sessile, Lvs, 3 lin, obtuse villous 5259 Anthers beardless included, Leaves broadish, Fl. terminal, Cal, imbricated 5260 Anthers beardless included, Leaves 3 lines long, Fl, capitate, Cal. ciliated 5261 Anthers beardless of middle length, Cor. campan. longer than cal. Style exserted, Leaves 3 6262 Leaves 4 hairy, Fl. capitate, Sepals and bractes very hairy, Cor. globose, Anthers beardless exserted 5263 Anthers beardless exserted, Style exserted, Cor. campan. Leaves 3 imbricated in 6 rows 5264 Anthers beardless, Leaves linear 3 smooth , Limb of cor. revolute 5265 Anthers beardless, Leaves appressed, Fl. capitate, Cor. limbate 5266 Leaves 2 channelled, F1. term. on short stalks, Sepals ovate acute, Anth. included crested 5267 Anth. beardless included, Cor. 3, Style exserted, Leaves 3 5268 Anthers bearded, Leaves opposite sagittate

5269 Anth. crested, Leaves 3 crect spreading much longer than joints glaucous, Bractes remote from calyx
5270 Leaves wedge-shaped, Cal. ovate cuneate, Cor. 4-cornered spherical, Anthers bearded
5271 Anth. crested, Leaves 3 ciliated, Cal. imbricated, Style exserted
5272 Anth. crested, Leaves 3 smooth, Cal. imbricated, Style exserted
5273 Anth. crested, Leaves 4
5274 Anth. crested, Leaves opp. appressed, Cal. large cup-shaped, Sepals rounded mucronate
5275 Anth. beardless, Leaves 3, Bractes remote, Cor. campan.
5276 Anth. beardless, Leaves and flowers 4
5277 Anth. beardless, Leaves 4, Flowers 8
5278 Anth, crested, Cor, ovate covered, Style included, Leaves 3, Stigma 4-parted
5279 Anth. beardless, Leaves opposite imbricated appressed, Umbels terminal many-flowered
E. Globose. Corolla small, globose.

5280 Cor. globose, Anth. crested, Two bractes next the calyx, the third remote
5281 Cor. globose, Anth. crested, All bractes close to calyx
5282 Cor. globose, Anth. crested, Bractes remote from cal. Leaves glandular at edge, Sepals ovate
5283 Anthers bearded, Cor. campanulate, Style included, Leaves 3, Flowers scattered
5284 Anth. bearded, Style exserted, Cor. camp. globose, Leaves 3 or 4 roughish, Branches pubescent
5285 Cor. globose glutinous, Anth. crested, Bractes remote, Leaves roughish
5286 Cor. globose, Leaves quite smooth, Anth. crested
5287 Anth. crested, Leaves 3 ovate smooth, Flowers umbelled ovate, Cal. entire, Branches villous
5288 Anth. crested, Leaves 3 linear smooth, Fl. umbelled globose, Cal. lanceolate short, Branches smooth
5289 Leaves 3 or 4 spreading finely ciliated, Fl. terminal, Bractes remote, Sepals ovate, Anth, included crested
5290 Anth beardless, Leaves 3 triangular smooth, Fl, racemose globose, Branches downy
5291 Anth. crested, Style exserted, Cor. globose campanulate, Fl. terminal umbelled, Leaves 4 smooth erect
5292 Anth. crested, Style included, Cor. ovate, Umb. many-fl. terminal, Leaves 4 or 5 , Branches pendulous 5293 Anth. bearded, Cor. globose camp. Cal. appressed ciliated, F1, term. and axill. 1 -sided, Lvs. 4 horizontal
5294 Anth. bearded, Style exserted, Cor, campanulate, Fl. whorled, Leaves 6 linear hairy
5295 Anth. beardless exserted, Cor. campanulate, Fl. term. capitate, Leaves 4 incurved ciliated

The climate for the heaths is not required to be warm during winter ; if the frost is excluded, that will be enough. Some species, as the E. persoluta for example, will even bear to have the ground about their roots frozen without injury, provided it is not thawed in the sun, or too suddenly, or in a very warm temperature. In general the heaths may be kept in the coldest part of the greenhouse, and those not in flower in pits, well coverel at night with mats or prepared coverings of reeds or straw. Too much fire-heat in winter will hurt them as much as any thing, as they only require to be kept from frost: most of the kinds might be preserved through the winter in frames: the only ditficulty is to keep the damp from them.
Heaths require a great deal of air and light, and therefore should be placed near the glass and near such

History，Use，Propagation，Culture，
glass as may be opened to admit air every mild day in the year．They require also very regular supplies of water；not much at a time，but so frequently that the earth may never get dry or the plant droop．Many kinds of plants，if they have suffered for want of water，may be recovered by an abundant supply，and placing them under a bell－glass on a little heat；but if once the roots of a heath are thoroughly dried，no art of the gardener will recover the plant．This is the true reason why so many heaths are destroyed when introduced as chamber plants，and also by gardeners who are ignorant of their nature．
Heaths are propagated by cuttings，seeds，and a few by layers．In propagating by cuttings，the tender tops are taken at whatever season of the year they begin to grow，which with most sorts is about the month of June．The strong growing kinds require the cuttings to be rather larger than the others，and some of the stunted growing kinds should be kept in the hot－house a little while when they begin to grow，to draw them to a sufficient length of young wood，or cuttings cannot be procured．Then take the extreme points of the shoots，and with a sharp penknife cut off their lower ends at right angles，placing the cutting on the nail of the thumb，as in cutting the nib of a pen．The cutting will be from three quarters to an inch long：strip off the leaves from the lower end to nearly half the length of the cutting；and，in order that this may be done

5296 Anth. bearded exserted, Cor. campanulate, Leaves 3 or 4 ovate acute fringed with glands
5297 Leaves 3 ovate, Fl. very minute 3-6 term. Style long exserted
5298 Anth. bearded, Cor. ovate conical, Style middling, Leaves 3 ovate pubescent white beneath
5299 Anth. beardless included, Cor. roundish, Leaves 3 ovate acute ciliated, Stem bispid
5300 Shoots long, Leaves smooth erect imbricated, Fl. axillary, Cor. globose shorter than stalk nodding 5301 Tube of cor, cup-shaped, Fl. axillary, Cal. imbric. Leaves 4
5302 Leaves 3 spreading acerose, Cor. campanulate rough with short hairs
5303 Bractes remote, Cor. with a short open limb, Anth. included bearded
5304 Flowers capitate, Bractes remote, Cor. hairy, Anth. included bearded
5305 Leaves hairy, Flowers capitate, Anth. included bearded
5306 Bractes remote, Flowers very abundant, Anth. included bearded, Style exserted
5307 Leaves 3 ovate ciliated spreading, Fl, term. 3, Bractes remote, Cor. ovate shorter than its stalk 5308 Anth. bearded, Style included, Cor. camp. Cal. villous, F1. axill. whorled, Leaves 4 imbric. villous

5309 Anth. included bearded, FI, capitate, Bractes remote
5310 Leaves 3 narrow spreading, Cor. 4 globose campanulate
5311 Anth. bearded, Style exserted, Cor, camp. Sepals linear smooth, Fl. terminal umbelled, Leaves 4, Stem
5312 Branches slender upright, Leaves 3 short smooth, Fl. clustered terminal, Cor. globose campanulate
5313 Anth. bearded, Style included, Cor. camp. Sepals ciliated, Leaves 3-4 smooth, Branches Dubescent 5314 Leaves 2 spreading very narrow, Leaves 3 terminal, Cor. globose smooth
5315 Anth. bearded, Style included, Cor. ovate pubescent, Leaves 3 hairy, Stem hairy
5316 Anth. bearded, Leaves 4 or more hairy, Fl, terminal, Cor. pubescent
5317 Leaves 4 covered with glandular hairs, F1. capitate, Bractes none, Cal. hairy, Anth. included bearded 5318 Anth. bearded, Cor. globose mucous, Ped. 3 term. longer than fl. Leaves 4 linear with a cartil, serrul, edge 5319 Anth. crested, Style included, Cor, globose, Fl. umb. Leaves 4 linear 3-cornered smooth
5320 Leaves 4 and branches hairy, FL. capitate 4 or more, Cal. leafy, Anth. exserted bearded, Style long exserted 5321 Anth. beardless, Bractes remote
5299 Anth. beardless, Leaves linear 3 smooth, Limb of cor. revolute
5323 Leaves 3 short smooth, Fl. solitary term. Cor. ovate smooth, Anth. a little exserted
5324 Anth. beardless, Leaves 4 lanceolate vilłous, Fl. racemose, Cal. downy
5325 Anth. beardless included, Cor. ovate campanulate, Style exserted, Stigma funnel-form, Leaves 3
5326 Anth. beardloss, Leaves 3 linear smooth, Fl. camp. racemose, Bractes remote
5327 Anth. beardless, Leaves linear 3 smooth, Limb of cor. spreading recurved
5328 Anth. beardless, Leaves linear 3 smonth, Limb of cor. erect
5329 Anth. beardless exserted, Leaves 3 ciliated at base, Fl. term. 3, Sepals scarious
5330 Anth. beardless included, Stigma calypteate, Cor. dilated upwards, Bractes remote
5331 Anth. beardless exserted, Leaves 3 smooth, Fl. term. Style exsert. Stigma peltate
5332 Anth. beardless, Leaves linear 4 smooth, Flowers terminal nearly 12
5333 Anth. beardl. exsert. Cor. urceol. smooth, Fl. term. umb. Leaves 3 pointed ciliated imbricated
5334 Anth. beardless exserted, Fl. urceolate villous, Leaves 3 revolute villous
5335 Anth, beardless exserted, Fl. cernuous turban-shaped covered by calyx, Leaves 3
5336 Leaves 3 or 4, F1. terminal 2, Cor, downy changing from green to crimson
5337 Anth. crested, Cor, ovate viscid, Fl. term. umb. Leaves scattered arcuate truncate 5338 Leaves 3 erect imbricated smooth, Fl. axill. Cor. urceolate, Style exserted
5339 Anth. beardless included, Fl. axillary spiked, Cor. campan. xibbed, Leaves 6 obtuse
5340 Anth. beardless, Leaves 3 ovate villous
5341 Anth. beardless, Leaves 3, Cal. 4-cleft very densely downy
5342 Anth. beardless, Leaves 3 hispid, Sepals hairy upwards, Cor. smooth
5343 Anth. bearded included, Cor. very small obov. obt. smooth, FI, umb, erect and cernuous, Lvs, 3-4 smooth
5344 Leaves two distant, Fl. numerous very minute globose campanulate, Style exserted

and Miscellaneous Parti culars.
without injuring the shoot, use a sharp penknife or a pair of small scissors, for the least bruise or wound spoils the cutting. This done, dibble the cuttings into pots filled with moistened white sand from pits, or with any small sand from pits or rivers, or, in default of that, with powdered sandstone. When they are all planted, water the whole to fix them still better, and when the moisture has subsided, cover them with a small crystal or greenish crystal bell-glass fitted within the rim of the pot, and place them in the shade on a spent hor-bed, keeping them quite close till rooted. The free-striking sorts will have roots in two months, and the others at different periods from three to twelve months, most of them will be ready for transplanting into pots of the smallest size in the following March. Their rooting is easily known by their beginning to shoot, and then the bell should be taken off an hour or two daily.

Many Ericas ripen their seeds in this country, and of other sorts seeds are regularly obtained by the nurserymen from the collectors at the Cape of Good Hope. Imported seeds generally arrive in the winter, and should be sown early in the spring following, in pots filled with equal parts of peat and sand well incorporated; the seeds should be thinly covered with earth gently pressed down, and bell-glasses placed over them as over the cuttings. The soil must be kept moderately moist by gentle waterings, and in about six or seven wecks.

## History, Use, Propagation, Culture,

the seeds, if fresh, will begin to come up, when the glasses may be removed by degrees, and the pots kept near the glass, and shaded from the mid-day sun till autumn, when they may be transplanted into pots of the smallest size.
Seeds which are saved in this country may be sown as soon as gathered, if they ripen before November; but if after that period, it will be better to preserve them till spring, and then treat them like foreign seeds.

Only a few heaths are propagated by layers, such as E. Massoni, retorta, petiolata, and one or two other delicate sorts, which when layed require two years to throw out roots. On the continent most sorts of heaths are propagated by layers, because there they are ignorant of the easiest mode of managing cuttings.
One of the best growers of heaths in Britain is a gardener of the name of Henderson, at Woodhall, in West Lothian. This judicious cultivator has had an extensive collection of Ericæ for upwards of thirty years under his care, and has given some account of his mode of management in a late volume (vol, iii, p. 323.)

5345 Anthers crested, Cor. cylindrical, Style exserted, Leaves 3 spreading
5346 Anthers crested, Cor. ovate, Leaves 3, Stigma capitate

5366 Anth. exserted, Fl. axill. Leaves 3 ovate
5367 Anth. exserted, Fl. axill. Leaves linear 3 or 4, Bractes in middle of flower-stalks, Cor. conical
5368 Anth. exserted, Fl. axill. Leaves 4-5, Bractes above the middle of flower-stalk, Cor. urceolate 5.69 Leaves short spreading, Fl. terminal urceolate, Style a little spreading

5370 Anth. exserted, Fl. axill. Leaves 4-5, Cor. campanulate, Pedunc. the length of cor.
5371 Anth. and style much exserted, Flowers axillary on very long slender hairy stalks
5372 Cor. conical, Leaves 3 ovate ciliated, Anth. beardless
5373 Plant all over hairy, Cor. ovate, Sepals brown at end, Stamens and style exserted
5374 Cor. conical, Leaves 3 linear smooth, Anth. beardless
5375 Cor. cylindrical, Fl. term. Bractes remote, Anth. beardless, Sepals ovate
5376 Cor. cylind. dilated upwards, Fl. term. Bractes remote, Anth. beardless, Sepals subul. from a broad base
5377 Cor. cylindrical dilated upwards, Fl. axill. Two bractes next cal. Sepals ovate oblong
5378 Cor, cylindrical dilated upwards, Fl. axill. Sepals subulate, Peduncles longer than flower
5379 Cor, cylindrical dilated upwards, F1, axill. Sepals subulate, Peduncles much shorter than flower
5380 Cor. cylindrical dilated upwards, Fl. axill. Sepals linear
5381 Cor. conical, Anth. beardless, Leaves 4, Limb of cor. erect
5382 Anth. beardless, Leaves linear 4 smooth, Fl. terminal 4
5383 Anth, beardless included, FL term. Bractes remote, Cor. narrowed upwards
5384 Leaves 3, Anthers beardless exserted, Flowers terminal
5385 Anth. exserted, FI, axill. Bractes remote, Leaves lin. 5, Cor, camp. Limb reflex. Ped, twice as long as cor
5386 Cor. cylindrical, FI. term. Bractes remote, Anth. bearded
5387 Stem spread on the ground, Leaves obtuse, Cor. dewy outside clavate, Anth. bearded
5388 Anth, beardless included, Cor. linear downy, Leaves downy 4
5389 Anth, crested, Leaves 3 ovate entire smooth, Fl. umb. furrowed, Cal spreading entire

5390 Anth. bearded, Style included, Cor. globose, Cal. villous reflexed, Fl. term. umbelled, Leaves 4 hairy

of the Caledonian Horticultural Society's Memoirs. He keeps his Ericas, ke says, "t at all times cool and airy, opening the glasses in winter when there is no frost, and letting the wind blow on them, and using no fire but in time of frost." "Never," he says, "shift any plant till the pot is quite full of roots, When the plants get large, several of them will continue in good health for three or four years without shifting, and flower well I have plants of E. retorta here, in pots seven inches in diameter, which are very bushy, being eighteen inches across, and fourteen inches high above the pot; E . infundibuliformis, two feet and a half in diameter, and two feet nine inches high; Erica pilosa between five and six feet high and three feet across, in pots eleven inches in diameter: these have not been shifted for five years, and are in high health, and covered with strong fine flowers from the mouth of the pot to the top of the plant." (Caled. Mem. iii. 327.)
"A prejudice," Page observes, "having spread that the culture of heaths is difticult, one of the greatest ornaments of the greenhouse has hence of late been neglected; although the method of culture is as easy and nearly as certain as that of the Geran um. but requiring a little more delicacy in the execution."

5418 Leaves lanc. narrowed at both ends viscid, Racemes branched, Fruit always with 2 wings length of stalk
5419 Leaves obl. mucronate entire, Fl. term. sessile
5420 Leaves lanceolate narrowed at each end, Branches 3-cornered, Fruit with narrow wings
5421 Leaves oblong lanceolate with revolute edge, rather clammy, Flowers in short racemes
5422 Unarmed, Leaves subsessile ovate acute at each end
5423 Branches spiny
5424 Leaves subsessile lanceolate with terminal corymbs of flowers

5425 Leaves stalked, Calyx hispid
5426 Leaves sessile, Calyx smooth
5427 Leaves lanc. obl. acumin. 5 nerved and branches hispid, Cal. covered with entangled radiate hairs 5428 Leaves lanceolate sessile, Tube of calyx ciliate scaly

and Miscellaneous Particulars.
Persia, and North America, and discovered this his genus. It is a handsome biennial, which bears a profusion of shewy flowers bearing some distant resemblance to those of the Passion-flower.
896. Jeffersonia. Named after Mr. Jefferson, the celebrated President of the United States. A very curious plant, remarkable for the peculiar mode of dehiscence of its capsule.
897. Dodonara. So named in honor of Rambert Dodoens, professor of medicine, a famous botanist of the sixteenth century, author of Fragum Historia, 1552; and Pemptades, 1583. He was born at Malines, in 1518, and died in 1585. The species are ugly tropical shrubs, of neither use nor beauty.
898. Lawsonia. In memory of Isaac Lawson, M. D. author of A New Voyage to Carolina, London, 1709. L. inermis is the Henna plant, with the leaves of which the Egyptian women dye their nails pink. It is of easy culture and propagation.
899. Usbeckia. So named by Linnæus, in honor of Peter Osbeck, a Swedish clergyman, member of the academy of Stockholm, and of the society of Upsal : author of a voyage to China and the East Indies, in 1751. Englished by Forster, in 1771. Little plants resembling Melastoma. Young cuttings strike freely under a hand-glass.

History, Use, Propagation, Culture,
900. Rhexia. A Greek name cinployed by Pliny to designate a Boragineous plant. It is dernved from $\dot{p} \varepsilon \sigma \sigma \omega$, to burst; that is to say, good against ruptures. The hardy species thrive best in a bed of peat; or they will grow very well in pots.
901. Enothera. Derived from ovos, wine, and $I$ grga, to hunt. The roots of this plant, $O$. biennis, eaten after meals, are incentives to wine-drinking, as olives arc. This is an ornamental genus of easy culture in light rich soil, and they increase ether by seeds or cuttings. O. biennis is called the night primrose, because the flowers usually open hetween six and seven o'clock in the evening. The mode of their expanding is curious. The petals are held together at top by the hooks at the end of the calyx, the segments of which first separate at bottom and discover the corolla, a long time before it acquires sufficient expansive force to unhook the calyx at top; when it has accomplished this, it expands very fast, almost instantaneously, to a certain point, and then makes a stop, taking a little time to spread out quite flat: it may be half an hour from the first bursting of the calyx at bottom to the final expansion of the corolla; which commonly becomes flaccid in the course of the next dav, sooner or later according to the heat or coolness of the weather. The

5499 Lvs. sess. lanc. 3-nerved villous ciliated, Cal. stellate hairy
5430 Leaves ovate lanc. 5-nerved hairy on each side, Panic. term. loosely many-fl.

5449 Lvs. ovate narrowed at each end toothed ; lower lyrate, Caps. stalked obovate angular
5450 Lvs. glaucous smooth lanceolate entire, Caps, sessile ovate angular
5451 Stem upright hispid furrowed, Leaves lanc. repand toothletted, Caps. sess. angular cvlindrical
5452 Stem muricated, Lower lvs. linear very long toothletted; cauline lanceolate
5453 Stem erect pubescent, Lys. lanc. lin. soft pubescent, Caps. obl. rounded sessile
5454 Pubescent, Lvs, lin. lanc. acute at each end entire, Fl. term. aggregate, Caps. clavate 4 -cornered
5455 Lvs. toothed sinuated, Caps. prismatical
5456 Lvs. lanc. pinnatifid at base, Caps. obovate with 4 wings
5457 Lvs. lanc. cut-toothed, Caps. obl. sessile, Tube of cal. very long, Pet. 2 -lobed
5458 Stem branched, Lvs. lanc. stalked with distant glandular teeth, Caps. ellipt. 4-winged on short stalks
5459 Leaves broad-oval repand toothed lævigated glaucous, Caps, ovate 4 -cornered
5460 Stem simple below, Leaves ovate stalked glandular toothletted, Racemes leafy, Caps. obovate 4-cornered
5461 Lower leaves oblong, upper linear, Caps. cylindrical straight, Petals crenulate
5462 Leaves pinnatifid, with the terminal segment large and toothletted
5463 Leaves linear obovate, Caps. cylindrical curved
5464 Downy, Leaves oblong lanc. toothed subpinnatifid, Raceme naked, Caps. obovate angular
5465 Leaves lyrate and lanceolate toothed, Caps. stalked clavate
5466 Hairy, Leaves lanc. toothletted, Caps, axillary curved angular acute
5467 Very like OEnothera acaulis, from which it is chiefly distinguished by its yellow flowers
5468 Finely pubescent, Stem and nerves of leaves white, Leaves pinnatifid, FI. spiked
5469 Leaves lanc. toothed, Pet. obovate ascending spreading, Style and stamens declinate
5470 Leaves lin. lanc. toothletted, Spike close, Petals as long as cal. Stigma entire
5471 Leaves lin. lanc, toothletted, Style and stamens straight
5472 Leaves ovate toothed, Pet. ovate acute cruciate, Style and stamens straight
5473 Leaves lin. kanc. deeply toothed, Pet. 3 ascending, Stamens 6 declinate
5474 Leaves scattered lin. lanc. entire veiny, F1. unequal
5475 Leaves scattered lin. obsoletely toothletted veinless, Petals unequal entire
54\%6 Leaves altern. and opposite lanc, ovate nearly entire pubescent veinless, Fl. unequal

and Miscellaneous Particulars.
uppermost flowers come out first in June; the stalk keeps continually advancing in height, and there is a con. stant succession of flowers, till late in autumn. The roots are eaten in some countries in the spring.
O. Iongifora has flowers uncommonly large and shewy, which continue frum July to October.

The dwarf North American herbaccous kinds, are among the most beautiful plants of our borders.
902. Gaura. A very curious genus, so called from roweos, superb. Its flowers are rose colored, in fine terminal spikes. Plants with the habit of CEnothera, and requiring the same management.
903. Euilobium. From $\varepsilon, T$, upon, and $\lambda o$ Ros, a pod; that is to say, a flower growing upon a pod. E. angustifolium is a native of most parts of Europe, from Lapland to Italy. It is valuable in shrubberies as thriving under the drip of trees, and succeeds every where, even in the smoke of cities, and in parks: it is a good plant to adorn pieces of water, being hardy, of rapid increase, not much relished by cattle, and very shewy when in flower. According to Haller, the young shoots are eatable, although an infusion of the plant stupifies: the pith when dried, is boiled, and becoming sweet, is by a proper process made into ale, and this into vinegar by the Kamtschatdales ; it is also added to the cow-parsnip, to enrich the spirit that is prepared

History，Use，Propagation，Culture，
from that plant；as fodder，goats are said to be extremely fond of it，and cows and shecp to eat it ；the down of the seeds mixed with cotton or fur has been manufactured into stockings and other articles of clothing．
E．hirsutum is found only in rich moist soil by water．The leaves smell like scalded codlings or gooseberry pye when green，but lose that odor when dry．Cattle are rather fond of the plant both recent and dried，
904．Fuchsia．So named in honor of Leonard Fuchs，a famous German botanist，author of Historia Stirpium，in 1542，with 516 excellent engravings in wood．F．coccinea is one of the most elegant of deciduous greenhouse shrubs；the young wood and nerves of the leaves are tinged with purplish red：the pendent blossoms，like most produced from the axils of the leaves，as the shoots grow，continue during the greater part of the growing season，and are succeeded as they fade by a purple berry．The finest specimen in England of this species is at Salt－Hill．
Many other species have been lately introduced，some of which will probably be very handsome．South America contains some most splendid species，of which we know nothing in this country．
905．Jambolifera．From fero，to bear，and Jambol，the name of a Malabar fruit．Cuttings strike freely in sand under a hand－glass．
906．Oxycoccus．From oद̆us，acid，and zoxzos，fruit；on account of its acidity．A genus well distinguished from Vacciniurn，by the narrow revolute segments of corolla．These are pretty little trailing evergreen plants， to which a peat soil and rather a moist situation are absolutely necessary ：they are very little changed by culture．
O．palustris bears edible berries which are gathered wild both in England and Scotland，and made into tarts Lightioot says，twenty or thirty pounds worth are sold each market day，for five or six weeks together，

and Miscellaneous Particulars.
in the town of Langtown, on the borders of Cumberland. The plant might no doubt be cultivated with equal ease as the American species.
O. macrocarpus fumishes the cranberries sent from America: it was first cultivated in this country by Sir J. Banks, on the margin of a pond (Hort. Trans, i, 71.), and subsequently both in moist and dry situations by different cultivators. Peat earth is essential to every mode of culture; but a much less degree of moisture will do than was at first believed. Salisbury found it do very well in pots of bog earth set in the shade ; and Milne found "vigorous shoots and abundant crops produced on dry beds of peat earth, even in the warm summer of 1822." The American cranberry he found easier to cultivate than the common sort ; but Hallet ound both the cranberry and bilberry succeed perfectly under such treatment. (Hort. Trans. iv. 483, and v. 279.
907. Vaccinium. A name, the derivation of which is not known. Neither are commentators more decided as to what was the Vaccinium of the Latins. The only conclusion to which they have come, is that the Vaccinia nigra of Virgil are the same as the \(\mu \in \lambda \propto y ~ \dot{\sim} \nsim \downarrow v\) os of the Greeks. The species are neat little evergreen under shrubs, and inhabitants of moist alpine or subalpine regions in peat earth.
V. Myrtillus is an elegant and also a fruit-bearing plant. The young fresh green leaves, and wax-like red gathers appear in May, and towards autumn the leaves grow darker and more firm, ard the ripe berries are Thered in the north for tarts, and in Devonshire and Poland are eaten with clotted cream. (Eng. Bot.) The berries are very acceptable to children, either eaten by themselves or with milk, or in tarts, The moorgame live upon them in the autumn. The juice stains paper or linen purple. Goäts browse upon the plant; heep are not fond of it; horses and cows refuse it. (Withering.) The berries have an astringent quality; and in Arran and the Western Isles are given in diarrhceas and dysenteries with good effect. The High.

History, Use, Propagatzon, Culture,
landers eat them with milk, and make them into tarts and jellies, which last they mix with whisky to give it a telish to strangers.
V. uliginosum grows taller than the common bilberry, and has large globular, black, glaucous fruit. These have less flavor, but abound with a weak acid juice. (Eng. Bot.) In large quantities it occasions giddiness, and a slight head-ache, especially when full grown and quite ripe. (Linn. Suec. and Withering.) Many vintners in France are said to make use of the juice to color their wines red. (Withering.) They furnish an ardent spirit which is highly volatile and intoxicating. The Alpine birds feed upon the fruit, and it is very common in theirhaunts, (fillars.
V. Vitis idæa is of very humble growth and almost herbaceous, though evergreen. The berries are red, acid, astringent, and bitter. They are scarcely to be eaten raw, and though made into pies in Derbyshire, where they are called cow-berries, their flavor is far inferior to the cranberry. Their best use is for making a rob or jelly, which is eaten with all kinds of roast meat in Sweden, and is far preferable to that of the red currant as a sauce for venison. It is also an excellent medicine in colds, sore throats, and all irritation of the mouth or fauces. (Smith, Brit, and Eng. Bot.) Linnæus says, that they are sent in large quantities from West Bothnia to Stockholm for pickling, and the same thing is confirmed by Dr. Clarke. Miller was in. formed that this plant was used for edgings in Norway.
V. tenellum is a very good fruit.

5509 Lvs. stalked obl. oval blunt entire beneath resin. Racemes lateral one-sided, Cor, ovateconical 5 angular

5533 Racemes term panicled, Leaves linear lanceolate cuspidate
5534 Head terminal sessile many-flowered, Leaves scattered obl. lanceol. smooth
5535 Flowers fascicled term. sessile, Leaves lanceol, naked mucronate
5536 Flowers term. subsessile, Leaves opp. obl. lanceol. obtuse narrowed at base glabrous
5537 Flowers twin terminal sessile, Leaves elliptic lanceol. smooth
5538 Flowers fascicled terminal, Leaves obovate obtuse above very smooth beneath villous

908. Nemecylon. The Greek name of the fruit of the Arbutus. The shrub now so called has a certain degree of resemblance to the Arbutus. Young cuttings plunged in sand in heat and covered with a handglass will root freely.
909. Lagetta. This plant in Jamaica is called Lagetto. Ripened cuttings will root in sand under a handglass.
y10. Daphne. The Greek name of the Laurel. This is a genus of diminutive shrubs, mostly evergreens of great beauty and fragrance in the flower, and with a peculiar velvei texture in the leaf. It is mentioned by Linnæus as a characteristic of the genus, that the terminating buds of the shoots produce leaves, and the lateral ones flowers. This affurds a hint to the cultivator to be sparing of his knife.
D. Mezcreum (Mádzaryoùn is the Persian name according to Richardson), Laureole gentille, Fr., Krillerhals, Ger, and Laureola femina, Ital, is an old inhabitant of the shrubbery, and deservedly much admired for its precocity and fragrance. It thrives well in loamy soil, and will grow in the shade and even drip of other trees. It is a native of all parts of Europe from Lapland to Sicily, but was first received from Elbing before it was observed to be a native. The roots of Mezereon acquire a very large size in proportion to the branches, and have more the character of the fusiform or ramose roots of a herbaceous, than of a ligneous vegetable. They are remarkably hot and acrid, and have long and in most countries been a popular topical

\section*{DIGYNIA．}

> History, Use, Propagation, Culture,
application for the toothach．The whole plant is extremely acrid，especialy when fresh，and if retained in the mouth excites great heat and inflammation，particularly of the throat and fauces．The berries when swallowed prove a powerful poison，not only to man，but to many quadrupeds．Both the bark and the berries of Mezereon in different forms have been long used externally in cases of obstinate ulcers and ill－conditioned sores．In France the bark is used as an application to the skin，which，under certain management，produces a serous discharge without blistering，and is thus rendered useful in chronic cases of a local nature，answer－ ing the purpose of what is called a perpetual blister，while it occasions less pain and inconvenience．In our own country the Mezereon has been principally employed in syphilitic cases．The branches make a good yellow dye．
D．Laurecla is valuable in the shrubbery as thriving under the shade and drip of other trees，and never growing to an unshapely size and figure，and in the nursery as affording stocks for the more rare species．The roots and other parts of the plant possess similar qualities to those of the Mezereon．
911．Dirca．From \(\delta\) ¢ez\＆，a fountain．A plant which grows in watery places．Bois de Plomb，Fr．This shrub grows in hilly swamps in North America ：it is in all its parts remarkably tough，and the twigs are in con－ sequence used for rods，and the bark for ropes，baskets，\＆c．Layers are generally two years in rooting； cuttings do not succeed，and it does not ripen seeds here．Snails，Sweet observes，are particularly fond of this plant．
912 Gnidia．One of the names given by the ancients to the Daphne．These plants＂thrive well in a sandy peat soil，with their pots well drained with broken potsherds：care must be taken not to over water them，or to let them flag for want of water，as their roots are very tender and are easily killed；the tenderest kinds are G oppositifolia，and G．pinifolia．（Bot．Cult．p．198．）

\section*{5539 The only species. Flowers appearing before the leaves}

and Miscellaneous Particulars.
913. Stellera. So named by Gmelin, in memory of Georg. Wilh. Steller, adjunct of the academy at Petersburg, who collected plants in Kamtschatka, and died in Siberia, in 1746. An inconspicuous plant resembling the next genus and requiring the same culture.
914. Passerina. From passer, a sparrow. Its seed has an appendage at the end like the beak of a sparrow. Young cuttings root freely under a bell-glass in sand.
915. Lachnea. Derived from \(\lambda \propto \chi y \eta\), wool, on account of the woolly heads of flowers.
916. Combretum. A name employed by Pliny. The plant of the ancients could have no relation to the plant now called by this name, which is a genus of splendid climbing shrubs, with beautiful branches of flowers which are often crimson or purple, and sometimes white. A number of species are found at Sierra Leone. They are all stove plants.
917. Galenia. So named by Linnæus from the famous physician Claudius Galenus, born at Pergamus, 133 years before the Christian ara. A coarse-looking shrub, with the leaves obscurely papillose or bladdery, and the stem round.
918. Aphananthe. A name contrived from \(\alpha\), privative, \(\phi \alpha v a\), to be remarkable, and \(\alpha y, 9 o s\), a flower: that is to say, a plant which is not remarkable for the beauty of its flowers. A curious little Brazilian weed.
919. Weinmannia. In honor of John William Weinmann, a German botanist, who published in 4 vols. folio, his Phytanthoza Iconographica, about the middle of the last century. Handsome shrubs, with pinnated leaves.
020. Mohringia. So named by Linnæus, from Paul Henry Gerard Moehring, a physician, author of Hortus Proprius, 1736. A little inconspicuous weed-like plant. It suits very well for rock-work, or to be grown in small pets.

History，Use，Propagation，Culture，
921．Polygonum．From ronvs，many，and rovv，knce，many joints．These are neariy all common weeds of temperate climates．P．Bistorta，being one of the strongest vegetable astringents，might well be applied to the purpose of taming leather，if it could be procured in sufticient quantity．The young shoots were formerly eaten in berb－puddings in the north of England，where the plant is known by the name of Easter Giant，and about Manchester they are substituted for greens under the name of Patience Dock．（Curtis，Withering．） The root was formerly considered to be alexipharmic and sudorific．
P．viviparum is so named on account of the flowers frequently changing into vegetable bulbs．The roots have the same qualities as those of P．Bistorta，and are eaten in Sweden and Lapland，Siberia and Tartary．

P．amphibium is one of the most difficult weeds to eradicate from recovered alluvial lands，and has no equal in this respect unless Equisetum．The roots，which in the water are properly stems，are found to a great depth in such soils；and though by fallowing or otherwise stirring the surface，the leaves may be pre－ vented from showing themselves for several years；yet if the field be allowed to lie a year in grass，the surface will be found abounding with Polygonum．Many tracts in Scotland which have been recovered from rivers and estuaries for an unknown series of years still abound with this plant，and as under such circumstances it never advances so far as to flower and seed，the individuals must be the same which formerly were suspended in the water．As an aquatic，it has a gay，showy appearance，when in flower．
\(\mathbf{P}\) ．Hydropiper is a powerful diuretic，and will dye woollen cloth of a yellow color．
P．tinctorium，and also chinense and aviculare，are cultivated in China for dying cloth of a beautiful blue or green．

and Miscellaneous Particulars.
P. orientale is a well known annual, showy, and fit for shrubberies. The seeds were first sent to Europe by Tournefort, who saw it growing in the garden of the monks of the three churches near Mount Ararat. They cultivate this plant there, not only for the beauty of the flowers, but for its medicinal qualities, which are the same with those attributed to our common species. (Mill. Fig.) The seeds are farinaceous.
P. aviculare is so named from the gratefulness of its seeds to small birds; the English name, knot-grass, from the knottiness of the stem, and because it is eaten by cattle; many such plants having obtained the name of grass, though they bear no similitude to real grasses. Hogs eat it with great avidity, ard hence it is known in many countries by the name of hogweed. All other domestic quadrupeds are said to eat it. The seeds are useful for every purpose in which those of buckwheat are employed, but they are much smaller.
P. Fagopyrum, (Fagus, beech, and rvgos, corn, its grain is like the mast of beech,) properly beechwheat, Bled noir or Sarrazin, Fr. Buckwheat is considered a native of Asia and not of Europe, though sometimes found in a seemingly wild state. It will not, however, bear the frosts of our springs or the severity of winter. In China and other countries of the East, it is cultivated as a bread corn. The flower is also used in cookery and bread-making in various parts of Europe, to make cakes and crumpets in England, and as rice or gruel in Germany and Poland. The seed is said to be excellent for horses and poultry, the flowers for bees, and the plant green for soiling cows, cattle, sheep or swine. As an agricultural plant it is valuable, as standing only a short time on the ground; but it produces little straw for manure,
922. Coccoloba. From zoz\%os, fruit, and \(\lambda 0 \beta \circ 5\), a lobe; the fruit has three lobes. C. uvifera is a common tree in most of the sugar colonies, generally near the sea. It is remarkable for its large leaves, and when of

> History, Use, Propagation, Culture,
a considerable size, its wood is valued for cabinet work. The berries are of the size of grapes, reddish brown or purplish without, with a thin pulp, rather astringent, and a large stone within. All the species grow freely in light loamy soil; and ripened cuttings, taken off at the joint, and placed under a hand-glass, in a pot of sand, will root freely: one cutting under a glass is sufficient, as the leaves must not be shortened. (Bot. Cult 41.)
923. Paullinia. So named by Linnæus, from Simon Paulli, professor of botany at Copenhagen ; author of Botanicum Quadripartitum, 1640, and Flora Danica, 1648. P. polyphylla affords a well known walking-stick. In the woods of Jamaica it rises with a slender, woody, tough, flexile stalk, and ascends among the bushes to a considerable height. When the wood is ripe it is cut down, barked, and used as riding or walking sticks.
All the species succeed well in a light loamy soil; and large sized cuttings root in sand under a handglass.
924. Seriana. Named by Schumacher, after one Paul Serjeant. Cuttings root in sand under a hand-glass.
925. Cardiospermum. From zas \(\delta \alpha\), a heart, and \(\sigma \pi \varepsilon \rho \mu \%\), seed, in allusion to its round seeds, which are marked with a spot like a heart. The plant is remarkable for its inflated membranous capsule, from which it is sometimes called balloon vine.
926. Sapindus. A syncope of sapo-indicus, Indian soap. Its fruit is covered with a pulp, which is used in America for washing linen. S. Saponaria bears a berry as large as a cherry, inclosing a nut of a shining black when ripe. These nuts were formerly brought to England for buttons to waistcoats; some were tipped with silver, and others with different metals; they were very durable, as they do not wear, and seldom broke. The skin or pulp which surrounds the nut is saponaceous, and is used in America to wash linen; but it is very apt to burn and destroy it, if often used, being of a very acrid nature.

The whole plant, especially the seed-vessel, being pounded and steeped in ponds, rivulets, or creeks, is ob-

served to intoxicate and kill the fish. Loureiro celebrates the berries, slightly bruised and steeped in water, as a very excellent soap; and remarks that it is only required to use them with prudence, all abstergents being in some degree corrosive.
927. Verea. So named after the late James Vere, Esq., a gentleman of fortune, who patronized gardening, and had once a fine collection of living plants. The species thrive best in sandy loam, and should be plunged in the bark pit to make them flower. The leaves placed on a pot of mould, or on the tan, will shoot out young plants from the notches of the margin. (Bot. Cult. 35. .)
928. Bryophylhum. From \(\beta_{\rho}\). \(\omega\), to grow, and \(\varphi u \lambda \lambda o y\), a leaf. If the leaves are laid upon damp earth their notches push forth roots, whence proceed young plants. This plant requires very little water, and the pot to be well drained : it flowers best plunged in a tan heat; rich loamy soil suits it best.
929. Paris. According to some authors, this word is derived from par, equal ; in allusion to the regularity of the parts of the plant. Few plants are more readily distinguished than this, by the proportion and regularity of all the parts.

The regular number is four, or some aliquot part or multiple of that number. There are, however, sometimes only three leaves, and they are even said to vary from one to seven. The calyx also has sometimes three leaves. The leaves and berries are said to partake of the properties of opium; and the juice of the latter to be useful in inflammations of the eyes. Linnæus says, the root will vomit as well as ipecacuanha, given in a double quantity. It is a suspicious plant, which has nevertheless been used in medicine in a great variety of ways.
930. Adoxa. From \(\alpha\), privative, and \(\delta<\xi \kappa\), glory - inglorious. This plant is minute, and by no means beau. tiful, and grows in obscure places.
931. Elatine. From \(\varepsilon \lambda \propto \%\), a fir, in Greek. Its fine leaves have been compared to those of a fir-tree.

History, Use, Propagation, Culture,
932. Haloragis. From \(\dot{\alpha} \lambda \boldsymbol{\lambda}, \alpha \wedge \sigma \xi\), the sea, and \(\rho_{\rho} \alpha_{\xi}\), the berry of a bunch of grapes. This plant grows on the sea shore, and its fruit is globular like a berry.
433. Forstöhlca. In memory of Peter Forsköhl, a Swede. born in 1732; he was professor at Copenhagen;

Order IV.

travelled at the expence of the king of Denmark into Egypt and Arabia, and died in the latter country of the plague in 1763. Inelegant plants, with the aspect of a nettle.

\section*{Class IX. - EnNEANDRIA. 9 Stamens.}

Ore of the smallest of the Linnean classes; containing, however, three important genera; the Laurel, famous for the valuable spices it produces, and for the beautiful foliage of its insipid species; the Cashew nut, well known at the tables of the great or luxurious; and the Rhubarb, one of the most valuable of medicines.
The class itself is extremely unnatural, and the assemblage of genera most incongruous.

History, Use, Propagation, Culture,
934. Laurus. From the Celtic blaur (the \(b\) is dropped in pronunciation, laur), green. The laurel is perpetally green. This genus contains several important spice or drug-bearing trees, besides the poetical laurel and a fruit tree.
L. Cinnamomum (qu. China Amomum) has a smooth ash -colored bark, a short erect trunk, and wide spreading branches, which form an elegant head. The leaves are of a bright green above, pale beneath, and white veined; the flowers are in panicles, have no shew, and are inodorous, or perhaps somewhat foetid; the fruit is the size of a middling olive, soft, insipid, and of a deep blue; it encloses a nut, the kernel of which germinates soon after it falls, and therefore cannot easily be transported to a distance. The timber is white, and not very solid; the root is thick and branching, and exudes abundance of camphor. The inner bark forms the cinnamon of commerce. There are many varieties, and probably some of them species, especially in the island of Ceylon, but only four are said to be barked. Besides Ceylon, the tree grows plentifully in Malabar, Cochin China, Sumatra, and the Eastern islands. It has been cultivated in the Brazils, the Mauritius, India, Jamaica, and other places. The soil in which it thrives best is nearly pure quartz sand. That of the cinnamon garden near Colombo in Ceylon, was found by Dr. Davy to consist of 98.5 of silicious sand, and of 1.0 only of vegetable matter in 100 parts. "The garden is nearly on a level with the lake of Colombo; its situation is sheltered; the climate is remarkably damp; showers are frequent, and the temperature is high and uncommonly equable." (Davy's Ceylon, p. 39.)

The trees that grow in the valleys, in a white sandy soil, are fit to be barked when four or five years old, but those in a wet soil or in shady places, require to be seven or eight years of age. The bark is good for nothing if the tree be older than eighteen years. The tree was formerly propagated by a species of pigeon that ate the fruit and voided the seed; but since Falck, one of the Dutch governors, about the middle of the eighteenth century, raised it from berries sown in his garden, it has been regularly cultivated.

The barking commences early in May, and continues until late in October. Branches of three years old are selected, and topped off with a pruning knife or bill hook. To remove the bark a longitudinal incision is made through it on both sides of the shoot, so that it can be gradually loosened and taken off entire, forming hollow cylinders. The bark in this state, tied up in bundles, is allowed to remain for twenty-four hours, by which a fermentation is produced that facilitates the separation of the epidermis, which, with the green pulpy matter under it, is carefully scraped off. The bark now soon dries, contracts, and assumes the quilled form, after which the smaller pieces are put within the larger. 'The cinnamon, when dry, is tied up in bundles of 30 lbs . weight, and carried to the Government store-house, where the quality is determined by inspection of the bundles. It was formerly chewed for this purpose; and the surgeons who used to be thus employed, had their

mouths so excoriated, as to be unable to continue the process longer than two days together : but tasting is now seldom had recourse to.

Cinnamon bark is astringent, cordial, and tonic. But the principal use of cinnamon is to cover the nauseous state of other remedies. (Thomson's London Dispensatory, 354.)

An oil is procured from the leaves and roots of cinnamon; the former is called the oil of cloves, and the latter the oil of camphor ; both are powerfully stimulant, and used in cramps of the stomach, flatulent colic, hiccough, toothach, and nervous langour.

According to Sweet L. Cinnamomum is the hardest plant of the genus to cultivate in our stoves. "I have scarcely," he says, "ever seen it do well any where but at Messrs. Loddiges," who generally keep their stoves warmer than other gardeners usually do; and the cinnamon likes a warm atmosphere, and very little water in winter. It grows best in a mixture of sandy loam and peat, the pots heing well drained with small potsnerds. Ripened cuttings soon take root in a pot of sand, plunged under a hand-glass, in a good moist heat. (Rot. Cult. 74.)
The plant has regularly flowered and ripened seeds in the hothouse of the Bishop of Winchester for several years past.
I. Cassia is also decorticated like the cinnamon, but it is considered of inferior value, on account of containirig a greater proportion of mucilage. What are called Cassia buds, are not obtained from this tree, but are the hexangular fleshy receptacles of the seed of the L. Cinnamomum, Cassia bark and buds are used in the same manner as cimnamon bark : the tree also affords an oil of similar use. In our stoves, the cassia grows more readily than the cinnamon; the same kind of soil suits it ; and cuttings root freely treated in the same manner. (Bot. Cult. 74.)
I. Camphora, an alteration of the Arabic name, kafour, is nearly allied to the cinnamon tree. The ronts, wood, and leaves of this tree have a very strong odor of camphor; and from the roots and smaller branches it is obtained by distillation. They are cut into chips, which are suspended in a net within a kind of still or iron pot, the bottom of which is covered with water, and an earthen head fitted to it; heat is then applied, and the steam of the boiling water, penetrating the contents of the net, elevates the camphor into the capital, where it concretes on straws, with which this part of the apparatus is lined. Camphor is stimulant, narcotic, and diaphoretic, but its stimulant powers are very transitory, and followed by sedative effects. In moderate closes it operates as a cordial, increasing the heat of the body, and exhilarating, besides softening, and rendering fuller the pulse, and promoting diaphoresis; in large doses it allays irritation and spasm, abates pain, and induces sleep. But in immoderate doses camphor proluces vomiting, vertigo, delirium, convulsions, and other

History, Use, Propagation, Culture,
deleterious effects. The greater part of the camphor brought to Europe is obtained in Sumatra from the Dryobalanops Camphora. This tree is cut and split, and the camphor which is found concreted in the heart of it is picked out and washed in a ley of soap. Zea describes a variety of camphor which is procured in South America from a tree, the botanical characters of which are not yet known, but which is termed caratta by the vatives. The camphor exudes from the bark in the form of tears. (Thomson's London Dispensatory, 356.)
L. Chloroxylon has its specific from the color of the wood, \(\chi \lambda \omega \rho a y\), green, and \(\xi \nu \lambda, a y\), wood; it is esteemed one of the best timber trees in Jamaica, and used on all occasions where strength and durability gre required: being both hard and tough, it answers better than any other wood for the cogs of sugar mills.
L. nobilis, the Laurier, Fr., Lorbecrbaum, Ger., Alloro, Ital., Laurel, Span., the Laurus of the Romans, and Daphnc of the Greeks, was designated nobilis by Linnæus, because it was consecrated to priests, sacrifices, and heroes in the ages of antiquity, and has been celebrated accordingly. To the poet and sculptor it still affords emblems for victorious heroes; and it is also used in cookery and medicine. In the south of Italy it grows to a sufficient height to be considered a tree; but is so prolific in suckers and low shoots as always to have the character of a shrub. It forms a dense and yet broken and picturesque mass of a very fine deep green, inclining to olive, and is abundantly covered with berries, which are dark purple or black, when rupe. Oil is obtained from the latter by boiling water. Both the leaves and the berries have a sweet fragrant odour, and an aromatic, astringent taste; and the oil, which is of a yellowish green color, has a stronger but similar odor and taste. Water distilled from the leaves shews traces of prussic acid; and it is probably on this component that their medicinal and poisonous property depend. Leaves, berries, and oil are narcotic and carminative. (Thomson's London Dispensatory, 360.)
L. indica grows in the Canary Isles and Virginia. The wood is of a yellow color, not heavy, good for building, but better still for furniture: it is called Vigniatico in the island of Madeira, and is probably what is imported into England under the name of Madeira mahogany. It is hardly to be distinguished from mahogany, except that it is somewhat less brown. (Howisw. Voy. ii. p. 5.)
L. Persea (Persea is a name under which Theophrastus describes an Egyptian tree not now known,) has a trunk as large as our common apple tree; the bark is smooth, and of an ash color; the branches are very succulent and soft, beset with pretty large oblong smooth leaves, like those of laurel, of a deep green color. The flowers are, for the most part, produced towards the extremities of the branches. The fruit is the size of one of our biggest pears. The pulp of the fruit is covered with a tough skinny coat, and contains a large rugged seed, which is wrapped up in one or two thin membranous covers. This fruit is held in great esteem in the West Indies: the pulp is of a pretty firm consistence, and has a delicate rich flavor; it gains upon the palate of most persons, and becomes soon agreeable even to those who cannot like it' at first; but it is so rich and mild, that most people make use of some spice or pungent substance to give it a poignancy; and, for this purpose, some make use of wine, some of sugar, some of limejuice, but most of pepper and salt. This fruit seems equally agreeable to the horse, the cow, the dog, and the cat, as well as to all sorts of birds; when plentiful, it makes a great part of the delicacies of the negroes. (Browne.)
L. Borbonea was regarded by Plumier as a genus distinct from Laurus, and he applied what is now its specific name, in memory of Gaston Bourbon, son of Henry IV. and uncle of Louis XIV. It is a very common tree in swamps in Carolina, and affords a fine grained wood excellent for cabinets; some of the best resembles watered satin.
L. Sassafras (Sassafras is an alteration of the Spanish word Salsafrat, which signifies Saxifrage, the virtues of which are attributed by the Spanish Americans to this plant, has the flowers often imperfect as to the male and female organs, which, before observation was so accurate and scientific as at present, led to the conclusion

and Miscellaneous Partıculars.
that one plant bore only males and the other only hermaphrodites; it is now found the alleged males are only imperfect hermaphrodites. The wood, root, and bark have a fragrant odor, and a sweetish aromatic taste : their sensible qualities and virtues depend on an essential oil, which can be obtained separate by distilling the chips or the bark with water: it is a stimulating diaphoretic and diuretic, and has been employed in cases of scurvy, chronic rheumatism, gout, and in cutaneous affections; but its effects are very uncertain; and even the diaphoresis which it is supposed to occasion may rather be ascribed to the guaiac, and other more powerful medicines, with which it is generally combined. (Thomson's London Dispensatory, 361.)
The species are well divided into several genera, such as Laurus, Tetranthera, Cinnamomum, and others : but as this division has not been applied to the old species of Laurus generally, it has not been practicable to adopt it here.
935. Anacardium. From ava, in composition, like, and zaedra, heart, in allusion to the form of the nut. This is an elegant tree, bearing panicled corymbs of sweet-smelling flowers, succeeded by an edible fruit of the pome kind, of a yellow or red color. This fruit or apple has an agreeable sub-acid flavor, with some degree of astringency. The juice expressed and fermented yields a pleasant wine ; and distilled, a spirit is drawn from it, far exceeding arrack or rum, making an admirable punch, and powerfully promoting urine. The dried and broken kernels are occasionally imported for mixing with old Madeira wine, the flavor of which they improve prodigiously. Some planters in the West Indies roast the ripe fruit, or slice one or two into a bowi of punch, to give it a pleasant flavor. The astringency of the juice has recommended it as a very signal remedy in dropsical habits.
The nut protrudes from one end of the apple. (Long.) It is of the size and shape of a hare's kidney, but is much larger at the end next the fruit than at the other. The outer shell is of an ash color, and very smooth, under this is another which covers the kernel; between these there is a thick inflammable oil, which is very caustic; this will raise blisters on the skin, and has often been very troublesome to those who have incautiously put the nuts into their mouths to break the shell. This oil has been used with great success in eating off ring-worms, cancerous ulcers, and corns; but it ought to be applied with caution. The kernel when fresh, has a most delicious taste, and abounds with a sweet milky juice. It is an ingredient in puddings, \&c. When older it is generally roasted; and in this state is not so proper for costive habits. Ground with cacao. it makes an excellent chocolate, When kept too long it becomes shrivelled, and loses its flavor and best qualities. The thick oil of the shell tinges linen of a rusty iron-color, which can hardly be got out ; and if any wood be smeared with the oil, it prevents the wood from decaying.
From the body of the tree is procured, by tapping or incision, a milky juice, which will stain linen of a deep black, that cannot be washed out again.
This tree also annually transudes from five to ten or twelve pounds weight of a fine semi-transparent gum, similar to gum arabic, and not inferior to it in virtue or quality, except that it has a slight astringency, which, perhaps, renders it in some respects more valuable. (Long's Jam. iii. 725, \&c.)

As a stove-plant it grows in light loam or rich mould, and ripe cuttings with their leaves, planted in a pot of sand, and plunged under a hand-glass, will strike root.
936. Cassytha. The Greek name of the Cuscuta, which this plant much resembles in habit and characters of analogy. Its affinity, however, is very curious; from a minute analysis of its constituent parts it has been decided by the most learned botanists to be referable to Laurinæ.
937. Eriogonum. From egov, wool, and rave, a knee. The stem of this plant is very woolly at the joints. The species thrive best in pots, and are principally to be increased by seeds.
938. Rheum. This name was ingeniously supposed by Linnæus to have been derived from \(p=\omega\), to flow, because the root causes a discharge of bile. It, nevertheless, was formed from Rha, the ancient name of the Volga

History, Use, Propagation, Culture,
Ammanus Marcellinus, lib, xii., says, "the \(7 h a\) is a river, on the border of which grows a reot, which bears its name, and is much renowned in medicine." The construction of the specitic names contirms this; Rha ponticum, Rha barbarum, whence the name Rhubarb was obtained.
R. Rhaponticum was thought to be the true rhubarb of druggists, till Dr. Hope of Edinburgh described the R. palmatum, some seeds of which he had received from Russia, as of the genuine species. It is not, however, finally settled, whether these species or the \(R\). compactum yield the foreign roots, nor does it appear of much consequence, as these three species agree so nearly in their medical properties, that any of them may be used with equal certainty of success. All the rhubarb of commerce, known under the names Turkey or Russian, and East Indian or Chinese, grows on the dechivities of the chain of mountains in Tartary which stretches from the Chinese town Sini to the lake Kokonor near Thibet. The soil is light and sandy; and the Bucharians assert that the best grows in the shade on the southern side of the mountains. Rhubarb, however, is also cultivated in China, in the province of Chen-See, where it is called Hai-houng. In Tartary, the roots are taken up twice a-year, in spring and in autumn, and after being cleansed and decorticated, and the smaller branches cut off, the body of the root is divided transversely into pieces of a moderate size, which are placed on tables, and turned three or four times a-day, during five or six days. A hole is then bored through each piece, by which it is hung up to dry, exposed to the air and wind, but sheltered from the sun. In about two months, the roots have lost seven parts in eight of their weight, and are fit for the market. In China, the roots are not dug up till winter; and the cultivators, after cleaning, scraping off the bark, and cutting them, dry the slices by frequently turning them on stone slabs heated by a fire underneath; after which, the drying is completed by hanging them up in the air exposed to the greatest heat of the sun. (Thomson's London Dispensatory, 4i1.)
Rhubarb has been cultivated in different parts of Britain with a view to drying the root for medical purgoses with the most perfect success ; but such is the prejudice in favor of the foreign article, that'sulficient do-

5669 Flowers in handsome terninal umbels

and Miscellaneous Particulars.
mand was not produced to encourage the cultivator. The only point in which British culture was rather deficient was in the drying, but that a little experience would soon have overcome.
K. Rhaponticum and hybridum, indeed any of the species, are or may be cultivated for the petioles of the leaves in a green state, to be used in tarts and pies, as a substitute or along with gooseberries. All that is required is a dry soil well enriched and trenched two, or better, three feet deep. The plants the year after planting may have half their leaves slipped off for the cook, as soon as they arrive at fuli growth. Keeping the plants from flowering will obviously strengthen the leaves.

Tart rhubarb may be forced either by taking up the roots and planting them in pots, or by covering them with dung where they grow in the open garden, as is done with sea-kale. It may also be blanched, as is done with that vegetable. (See Encyc. of Gard. art. Rheum.)
R. Ribes is so called from a rob made from its stalks, and called Rybès of Serapias.

It is thought that all the supposed species are reducible to Rhaponticum, undulatum, palmatum, and ribes. It is certainly very difficult to distinguish the others.
939. Butomus. From \(\beta \Varangle \varsigma\), an ox, and \(\pi=\mu y \omega\), to cut ; the sharp leaves of the plant cut and cause to bleed the mouths of cattle feeding upon it.
This is the only plant of the class Enneandria that grows wild in Britain. It is an elegant aquatic. "The water-Gladiole, or grassie-Rush," says Gerarde, " is of all others the fairest and most pleasant to behold, and serveth very well for the decking and trimming up of houses, because of the beautie and braverie thereof."

The corolla varies in different shades of red, or purple mixed with white, and is sometimes entirely white. The stem at bottom and the peduncles at top are often tinged with red. The number three is evidently predominant in the fructification; the corolla being doubly tripetalous, the stamens thrice three, the pistils six, the capsules six, in a hexagon form, the involucre three-leaved.

Class X.-DECANDRIA. 10 Stamens.
This is the last of the Linnean classes in which the stamens are distinct, and bear any determined relation to the other furts of the flower. It is composed of portions of a considerable number of natural orders, of which the most important is Leguminose, with which the class usually is made to commence. These are of two kinds: those which are papilionaceous, and those which have a regular expanded flower. The former are remarkable in their kind for bearing distinct stamens combined with a papilionaceous corolla; the greater part are natives of New Holland or the Cape of Good Hope, a very few of the Northern Hemisphere; and all of them ornamental plants. Of those with regular flowers the most beautiful genus is the Bauhinia, which, in the latitudes of the tropics, constitutes the most formidable obstacle to the passage of human beings through the woods, which are interlaced in every direction by the climbing or leaning stems of these and other plants commonly called Lianes; the most extensive genus is Cassia, the species of which are little esteemed as objects of ornament, but of material importance in medicine; the famous Senna of the shons being the produce of at least three species. The Hamatoxylon and Swietenia, the one producing Logwood, the other Mahogany, are inclucted in this class, as are the important Quassia drug, and the beautiful tribes of Kalmias, Rhododendrons, and Andromedas.
The second and succeeding orders are chiefly occupied by the most important of the genera of the natural order of Caryophylleæ, the whole of which have lately been remodelled and arranged, under the direction of Decandolle, by M. Seringe, an ingenious Swiss botanist. Of this order the most extensive genus is Silene, and the most beautiful Dianthus, out of which the fine carnations, pinks, and piccotees of the florist have been obtained

947. Baptisia. Cal. half 4-5-cleft, 2-lipped. Petals of equal length. Standard reflexed at edges. Stamons deciduous. Pod ventricose, stalked, many-seeded.
948. Podalyria. Cal. 5-cleft, unequal, pushed inwards at base. Standard larger than the rest. Stamens persistent, connate at base. Pod ventricose, many-seeded.
949. Chorozemia. Cal. half-5-cleft, 2lipped. Keel ventricose, shorter than wings. Style short, hooked. Stigma oblique, obtuse. Pod ventricose, many-seeded.
950. Podolobium. Cal, 5-cleft, 2-lipped. Keel compressed, the length of the wings, which are equal to the expanded standard. Ovary many-seeded in a single row. Style ascending. Stigma simple. Pod stalked, linear, oblong, moderately ventricose, smooth inside.
951. Oxylobium. Cal, deeply 5-cleft, rather 2-lipped. Keel compressed, the length of the wings, which are equal to the open standard. Style ascending. Stigma simple. Pod many-seeded, ventricose, ovate, acute.
952. Callistachys. Cal. 2-lipped. Standard erect, keel and wings drooping. Style incurved. Stigma simple, Pod stalked, woody before ripening, many-celled.
953. Brachysema. Cal. 5-cleft, but little unequal, with a ventricose tube. Standard shorter than the compressed kee!, which is as long as the wings. Ovary with a stalk, surrounded at base by id little sheath. Style filiform, long. Pod many-seeded, ventricose.
954. Gompholobium. Cal. 5-parted, nearly equal. Standard unfurled. Stigma simple. Pod many-seeded, nearly spherical, very obtuse, smooth.
955. Burtonia. Cal. deeply 5 -cleft. Cor, deciduous. Petals nearly equal. Ovary 2 -seeded. Style subulate, dilated at base. Stigma blunt, beardless. Pod roundish, moderately inflated. No appendage to the seed.
956. Jacksonia. Cal. 5-parted, nearly equal. Corolla and stamens deciduous. Ovary 2-seeded. Style subulate, filiform. Stigma simple. Pod moderately inflated, ovate or oblong, with valves downy inside. No appendage to the seed.
957. Viminaria. Cal, 5-toothed, angular. Style capillary, a little longer than the 2-seeded ovary. Stigma simple. Pod valveless, ovate. No appendage to the seed.
958. Spharolobium. Cal, 5-fid, 2-lipped. Style on one side at the end, with a membranous appendage, on the other beardless. Stigma terminal. Pod spherical.
959. Aotus. Cal. 5-cleft, 2-lipped. Stamens deciduous. Ovary 2-seeded. Style filiform. Pod 2-valved. No appendage to the seed.
Q60. Dillwynia. Cal, 5-cleft, 2-lipped, narrow at base. Petals and stamens deciduous, inserted into the middle of tube of calyx. Standard twice as broad as long, spreading, 2-lobed. Ovary 2-seeded. Style hooked. Stigma capitate. Pod inflated. Seeds with an appendage.
901. Eutaxia. Cal, 2-lipped. Standard a little broader than long. Ovary 2-seeded. Style hooked. Stigma capitate. Pod moderately ventricose. Seed with an appendage. Leaves opposite.
962. Sclerothamnus. Cal. 5-cleft, 2-lipped, with 2 bractes at base. Keel as long as wings. Ovary 2-seeded, staiked. Style ascending filiform. Stigma simple. Pod ventricose.
963. Gastrolobium. Cal. 5-cleft, 2-lipped, without bractes. Petals of equal length. Ovary 2-seeded, stalked. Style subulate, ascending. Stigma simple. Pod ventricoise. Seeds with an appendage.
964. Euchilus. Cal. deeply 5-cleft, 2-lipped, the upper 3 ip very large, with 2 bractes at base. Keel as long as wings. Ovary 2-seeded, stalked. Style subulate, ascending. Stigma simple. Pod compressed. Appendage of the seed with the hind lobes entire.
965. Pultenaza. Cal. 5-cleft with even-sized lips, 2-bracted. Ovary sessile, 2-seeded. Style subulate, ascending. Stigma simple. Appendage of the seed with the hind lobes cut.
966. Daviesia. Cal. angular without bractes. Ké shorter than standard. Ovary stalked, 2-seeded. Style straight. Stigma simple. Pod compressed, angular, opening with elasticity. Appendage of seed entire behind.
967. Mirbclice. Cal. 5-cleft, 2-lipped. Pod 2-celled, with each suture bent inwards.
968. Cercis. Cal, 5-toothed, Pod compressed with the seed-bearing suture winged. Seeds obovate, with a straight embryo.
969. Schotia. Cal, 5-cleft. Petals 5, inserted on the calyx, and approaching the papilionaceous form. Pod stalked.

\section*{82. Leguminosa. Flowers nearly regular.}
970. Bauhinia, Cal. 5-cleft, deciduous. Petals spreading, oblong, clawed; the upper one more distant; all inserted in the calyx.
971. Afzelia. Cal. tubular, with a 4-cleft deciduous limb. Petals 4, with claws: the upper very large. The upper filaments sterile. Pod many-celled. Seed with an arillus at base.
972. Hymenaza. Cal. 5-parted. Petals 5, nearly equal. Pod filled with a powdery fæcula.
973. Cynometra. Cal. 4-leaved : the opposite leaves largest. Pod 1-seeded, fleshy.
974. Cassia. Cal. 5-leaved. Petals 5. The three upper anthers sterile: three lower beaked.
975. Cathartocarpus. Cal. 5-parted, deciduous. Cor. regular, of 5 petals. The lower filaments bowed. Pod long, round, woody, many-celled. Cells filled with pulp.
976. Parkinsonia. Cal. 5-cleft. Petals 5, ovate, the lowest reniform. Style O. Pod necklace-shaped.
977. Poinciana. Cal. 5-parted. Petals 5, clawed; the upper dissimilar. Stamens very long, all fertile. Pod plano-compressed.
978. Casalpinia. Cal. 5-parted, with the lowest segment largest and vaulted. Petals 5. Stamens woolly at base, all fertile. Pod unarmed. Seeds compressed.
979. Guilandina. Cal. 5-cleft, the lowest segment largest. Petals inserted in the neck of the calyx, nearly equal. Pod prickly. Seeds stony.
980 . Hyperanthera. Cal. 5-parted. Petals inserted in calyx, unequal. Pod 3-valved, torulose. Seeds winged.
981. Hoffmannseggia. Cal. 5-parted, persistent. Petals 5, clawed, spreading : the upper broader, glandular at base. Filaments glandular. Stigma clavate. Pod linear, compressed, many-seeded.
982. Adenanthera. Cal. 5-toothed. Petals 5. Anthers with a globose gland at their extremity. Pod membranous. Seeds lentiform.
983. Cadia. Cal. 5-cleft. Petals 5, equal, obcordate. Pod many-seeded.
984. Prosopis. Cal. hemispherical, 4-toothed. Pod many-seeded.
935. Hematoxylon. Cal. 5-parted. Petals 5. Caps. lanceolate, 1-celled, 2-valved; valves navicular.
986. Copaifera. Cal. O. Petals 4. Pod 1 -seeded.

\section*{83. Ovary superior. Stamens united in a tube. Flowers complete.}
987. Trichilia. Cal. 4-5-toothed. Petals \(4-5\), ovate or oblong. Stamens sometimes nearly distinct. Caps, -celled, 3-valved, with one or two seeded cells. Seeds with a berried arillus.
988. Melia. Cal. 5-toothed. Petals 5. Drupe with a five-celled nut.
989. Quivisia. Cal. urceolate, 4-5-toothed. Petals 4-5, short, silky outside. Stamens with a short tube. Stigma capitate. Caps, coriaceous, 4-5-celled, opening at the end into 4-5-valves.
990. Swietenia. Cal. 5-cleft. Petals 5. Caps. 5 -celled, woody, opening at base. Seeds imbricated, winged.
991. Ekebergia. Cal. 4-parted. Petals 4. Nect. a ring surrounding the ovary. Berry 5 -seeded.
992. Heynea. Cal. 5-toothed. Petals 5. Style 1. Ovary 2-celled. Caps. 2-valved, 1-celled, 1-seeded. Seed with an arillus not winged.
§4. Ovary superior. Stamens separate. Flowers complete.
993. Guaiacum. Cal. 5-parted, unequal. Petals 5, equal. Caps, angular, 2-5-celled.
994. Zygophyllum, Cal, 5-leaved. Petals 5. Nect. 10-leaved, covering the ovary and bearing the stamens. Caps. 5-celled.
995. Fagoni.t. Cal. 5-leaved. Petals 5, cordate. Caps. 5-celled, 10-valved; with I-seeded cells.
996. Tribulus. Cal. 5-parted. Petals 5, spreading. Style O. Caps, 5, gibbous, spiny, many-seeded.
997. Dictamnus. Cal, 5-leaved, deciduous, Petals 5, clawed, unequal. Filam. declinate, with glandular dots. Caps. 5, united.
998. Ruta. Cal. 5-parted, Petals concave. Recept. surrounded by 10 honey-spots. Caps. lobed.
999. Crowea, Cal. 5-parted. Petals 5, sessile. Stamens flat, subulate, connected by entangled hairs. Anthers united lengthwise to the filaments on their inner side. Style from the base of the ovary. Caps. 5, united. Seeds with an arillus.
1000. Codon. Cal, 10-parted. Cor. campanulate, 10 -cleft. Caps. many-seeded.
1001. Gomphia. Petals 5. Filaments scarcely any. Anthers long, pyramidal, erect, opening at end by a double pore.
1002. Quassia, Cal. 5-leaved. Petals 5. Nect. 5-leaved. Drupes 5, distant, 2-valved, 1-seeded, inserted on a fleshy receptacle.
1003. Limonia. Parts of the flower 4 or 5. Stamens free, twice as numerous as petals, or sometimes as many only. Fruit berried, pulpy, 4-5-celled, with 1-celled seeds.
1004. Glycosmis. Parts of the flower 5. Stamens with flat subulate filaments, and elliptical anthers. Style short, cylindrical. Ovary 5-celled. Fruit fleshy, 1-2-celled, 1-2-seeded. Coat of the seed membranous,
1005. Murraya. Parts of the flower 5. Cor, campanulate. Stamens with linear subulate stamens, and roundish anthers. Fruit fleshy, berried, 1-2-celled, 1-2-seeded. Coat of the seed thick, woolly.
1006. Cookia. Parts of the flower 5. Petals navicular, villous. Stamens with linear distinct filaments, and roundish anthers. Fruit berried, globose, 1-5-celled, with one-seeded cells.
1007. Gertnera. Cal. 5-parted. Petals 5 torn. Filaments slightly cohering at base: one longer than the rest. Samara 1 -seeded, with four unequal wings.
1008. Monotropa. Cal. like a corolla, gibbous at the base. Capsule 5-celled, many-seeded.
1009. Dionжa. Cal, 5-leaved. Petals 5. Capsule 1-celled, gibbous, many-seeded.
1010. Garuga. Cal. campanulate, 5-cleft, bearing the stamens. Petals equal. Stigma 5-lobed. Drupe with 2-5 1-seeded nuts.
1011. Kalmia. Cal, 5-parted, Cor. hypocrateriform, with a limb having 5 horns beneath. Caps. 5-celled,
1012. Ledum. Cal. 5-cleft. Cor. fiat, 5-parted. Caps. 5-celled, bursting at base.
1013. Rhodora. Cal. 5-toothed. Petals 3. Stamens declinate. Caps. 5-celled.
1014. Rhododendron. Cal. 5-parted. Cor, somewhat funnel-shaped. Stamens declinate. Caps. 5-celled.
1015. Epigan. Outer calyx 3-leaved, inner 5-parted. Cor, salver-shaped. Caps. 5-celled.
1016. Andromeda. Cal. 5-parted. Cor. ovate, with a 5 -cleft orifice. Caps. 5-celled : valves contrary to the dissepiment.
1017. Enkianthus. Cal. small, persistent. Cor. campanulate, with a 5-cleft limb. Nectaries 5, at base of corolla. Anthers 2-horned. Capsule 1.
1018. Gualtheria. Outer calyx 2-leaved : inner 5-cleft, ovate. Nect. with 10 points. Caps. 5 -celled, clothed with an inner berried calyx.
1019. Arbutus. Cal. 5 -parted. Cor, ovate, with a 5 -cleft orifice; pellucid at base. Berry 5-celled.
1020. Clethra. Cal. 5-parted. Petals 5. Stigma 3-fid. Caps. 3-celled, 3-valved.
1021. Mylocaryum. Cal. 5-toothed. Petals 5. Stigma capitate, 3-cornered, sessite. Caps. 3 or 4 -winger, 3-celled.
1022. Pyrola. Cal. 5-parted. Petals 5. Capsule 5-celled, opening at the angles.
1023. Chimaphila. Cal, 5-parted. Petals 5. Stigma sessile, thick, orbicular, sunk in the ovary. Anthers beaked, opening by a 2valved cleft. Caps, 5 -celled, opening at the angles.
1024. Inocarpus. Cal. bifid. Cor. funnel-shaped. Stamens in a double row. Drupe 1-seeded.
1025. Styrax. Cal. inferior. Cor. funnel-shaped. Drupe 2-seeded.

\section*{§ 5. Ovary inferior. Flowers complete.}
1026. Jussicea. Cal. 4-5-parted. Petals 4-5. Caps. 4-5-celled, oblong, opening at the angles. Seeds numerous, minute.

1U27. Getonia. Cal. 5-leaved, persistent. Filaments altemately broader, 5 in the orifice of the calyx. Seed coated, oblong, crowned by the calys.
1028. Quisqualis. Petals 5 , inserted on a filiform calyx.
1029. Melastoma. Cal 5-cleft, campanulate. Petals 5, inserted in calyx. Berry 5-celled, surrounded by calyx.
1030. Petaloma. Petals 5, between the segments of the calyx. Berry 1-celled.
1031. Acisanthera. Cal. ventricose, 5-cleft. Petals 5. Anthers sagittate, versatile. Caps, crowned, 2-celled, many-seeded.

\section*{8. Flowers incomplete, or apetalous.}
1032. Dais. Involucre 4-leaved, Cor. 4-5-cleft. Berry 1-seeded.
1033. Bucida. Cal. 5-tonthed, superior. Berry 1-seeded.

10S4. Samyda. Cal. 5-parted, colored. Nect. campanulate, stamen-bearing. Caps. berried inside, 4-valved, 1 -celled. Seeds nidulant.

Order 2. DIGYNIA.

10 Stamens. 2 Styles.
1035. Royena. Cal, urceolate. Cor. I-petalous, with a revolute limb. Caps. 1-celled, \&-valved. 1036. Trianthema. Cal. mucronate under the end. Cor. O. Stam. 5-10. Ovary blunt. Caps. cut round.
1037. Scleranthus. Ca1. 1-leaved. Cor. O. Seeds 2, included in calyx.
1038. Cunonia. Petals 5. Sepals 5. Capsule 2-celled, acute,
1039. Hydrangea. Cal. superior, 5-toothed. Petals 5. Caps. 2-celled, 2-beaked, opening by a hole between the beaks.
1040. Chrysosplenium. Cal. 4-5-cleft, colored. Cor. O. Caps, 2-beaked, 1-celled, many-seeded
1041. Saxifraga. Cal. 5-parted. Petals 5. Caps. 2-beaked, 1-celled, many-seeded.
1042. Tiarella. Cal. 5-parted. Petals 5, inserted in the calyx, entire. Caps, 1-celled, 2-valved: one valve largest.
1043. Mitella. Cal. 5 -cleft. Petals 5, iuserted in calyx, pinnatifid. Caps, 1-celled. 2valved; with equal valves.
1044. Gypso,hila. Cal. 1-leaved, campanulate, angular. Petals 5, ovate, sessile. Caps. globose, 1-celled.
1045. Saponaria. Cal. 1-leaved, naked. Petals 5, clawed. Caps. 1-celled, oblong.
1045. Dianthus. Cal. cylindrical, 1-leaved, with scales at the base. Petals 5, clawed, Capsule cylindrical, 1-celled.

\section*{MONOGYNIA.}

History, Use, Propagation, Culture,
940. Eilwardsia. Named after the late Mr. Sydenham Edwards, a celebrated botanical draughtsman. The reputation of the Botanical Magazine has arisen almost wholly from the skill he displayed in the management of the figures of that work. These plants are hardy enough to survive through our winters out of doors, when they are not very severe : but are best protected under a trame, or planted in a conservatory: they generally ripen seeds, by which, or by young cuttings planted under a bell-glass in sand, they may be readily encreased. (But. Cult. 183.)
1047. Cuctbalus. Cal. 1-leaved, inflated. Petals 5, clawed. Berry superior, 1-celled, many-seeded.
1048. Silene. Cal. 1-leaved, ventricose. Petals 5 , clawed. Caps. \(\frac{1}{2}\)-3-celled, opening at end, many-seeded.
1049. Stellaria. Cal. 5-leaved, spreading. Petals 5, 2-parted. Caps. 1-celled, many-seeded.
1050. Arenaria. Cal. 5-leaved, spreading. Petals 5, entire. Caps. 1-celled, many-seeded.
1051. Cherleria. Cal. 5-leaved. Nectaries 5, bifid, petal-like. Every other anther sterile. Caps. 3-valved,

3-celled, 3-seeded.
1052. Brunnichir. Cal. ventricose, 5 -cleft. Cor. O. Caps. 3-cornered, 1 -celled, 1 -seeded.
1053. Garidella. Cal. 5-leaved, petaloid. Nect. 5, two.lipped, bifid. Caps. 3, united, many-seeded.
1054. Malpighia. Sepals 5, with two honey pores at base. Petals 5, roundish, clawed. Filaments cohering
at base. Drupe 1-celled, with 3 one-celled nuts.
1055. Banisteric. Cal. 5-parted, with two honey pores outside at the base. Petals roundish, clawed. Filaments cohering at base. Samare 3, 1-seeded, with a single wing at end.
1056. Hirca. Cal. without glands. Petals 5, with claws. Samaræ 3, surrounded by two opposite wings.

\section*{Order 4. PENTAGYNIA.}

10 Stamens, 5 Styles.

\footnotetext{
1057. Cnestis. Petals 5. Capsules 5, one-seeded.
1058. Averrhoa. Sepals 5. Petals 5, spreading upwards. Stamens inserted in a nectariferous ring: every other one shorter. Apple 5-cornered, 5-celled.
1059. Spondias. Cal. 5-toothed. Petals 5. Drupe with a 5-celled nut.
1060. Cotyledon. Cal. 5-cleft. Cor. 1-petalous. Five honey scales at the base of ovary. Caps. 5.
1061. Scdum. Cal. 5-cleft. Petals 5. Five honey scales at base of ovary. Caps. 5 .
1062. Penthorum. Cal. 5-cleft. Petals O. to 5. Caps. 5-pointed, 5-celled.
1063. Grielum. Cal. 5-cleft. Petals 5. Filaments persistent. Pericarps 5, one-seeded.
1064. Biophyton. Sepals 5. Petals 5. Stamens all distinct ; the five outer shortest. Styles 5, emarginate
at end. Capsule ovate, round, somewhat 5 -cornered.
1065. Oxalis. Sepals 5, distinct or united at base. Petals 5. Stamens united at base, the five outer shortest. Styles 5 , pencil-shaped, or capitate at end. Capsule oblong or cylindrical.
1066. Agrostemma. Cal. 1-leaved, coriaceous. Pet. 5-clawed. Limb obtuse, undivided. Caps. 1-celled.
1067. Lychnis. Cal. 1-leaved, oblong, smooth. Petals 5 -elawed, with a nearly 2 -fid limb. Caps. 5-celled.
1068. Cerastium. Sepals 5. Petals bifid. Capsute 1-celled, opening at end.
1069. Larbraea. Cal. 5-cleft, urceolate at base. Petals 5, biparted, perigynous. Styles 5. Ovary 1-celled, many-seeded. Capsule fi-valved at end.
1070. Spergulh. Sepals 5. Petals 5, entire. Capsule ovate, 1-celled, 5-valved.
}

Order 5. DECAGYNIA. 10 Stamens, 10 Styles
1071. Phytolacca. Sepals 5. Berry superior, 10 -celled, 10 -seeded.

\section*{MONOGYNIA.}
\(56 \% 0\) Leaflets 13-19 lanceolate oblong
5671 Leaflets 810 lines long obovate, Pubescence yellowish brown
5572 Leaflets 25.41 obovate

5673 A tree, Leaflets roundish or oval very obtuse at each end as well as the calyx downy 5674 A tree, Leaflets oblong ovate acute and pods smooth

Histoi \(y\), Lise, l'ropagation, Culture,
343. Anagyris, Fiom ayce, like, and runos, a circle. Its pod is curved inwards at its extremity. Small trees native of the South of Europe and North of Africa, and one doubtful species of Nepal. Young cuttings root in sand under a hand-glass.
944. Thermoysis. So named from the resemblance of the flower to that of a Lupine. This genus is cuitivated with difficulty: it grows best in a light loamy soil, and may be increased by seed; dividing the root is liable to injure the plant, so that it is increased with difficulty by that means. (Bot. Cult. 427.)
945. Virgilia. A genus dedicated by Iamarck to the poct Virgil, whose Georgics contain many things interesting to botanists.
946. Cyclopia. Named by Ventenat, from zuzios, a circle, and \(\pi \varepsilon 5\), a foot, in allusion to the replicate circle which is found about the base of the pods.
947. Baptisia. So named from Borrro, to dye, in allusion to the economical properties of some species, Herbaceous plants of easy cultivation, and as border flowers ornamental.
948. Podulyria. Podalyrus was a son of Esculapius. Small Cape shrubs, with simple silky leaves and purple blossoms. The species may be grown in leaf mould and peat, or peat loam, and rooted by cuttings in sand, or raised from seeds.
949. Chorozeonia. M. Labillardiée originally discovered this plant upon the south-west coast of New

5678 Leaves lanceolate acute
5679 Leaves elliptical obtuse
5680 Leaves lanceolate shining silky beneath

5681 Leaflets oblong-lanceolate, Stipules lanceolate twice as long as stalk, Pedicels whorled

5682 Leaves pinnate, Leaflets with a short point smooth, Racemes long pendulous
5683 Stamens persistent, Ovaries downy, Leaflets oval obtuse pointless
5684 Stamens persistent, Ovaries smooth, Base of calyx pushed inwards, Leaflets oval obt. with a little point 5685 Stam, decid, woolly at base, Ovaries downy, Keel acuminate, Leaflets lanceolate

5686 Leaflets subulate and sepals pointless, Bractes oblong ovate shorter than peduncle, Branchlets smooth
5687 Leaves perfoliate entire roundish
5688 Stem and leaves very hairy, Leaflets oval obtuse, Raceme terminal spiked
5689 Leaves ternate stalked, Leaflets cuneate lanceolate, Stipules longer than stalk lanceolate
5690 Leaves ternate stalked, Leaf. ellipt. obl. Stipules deciduous subulate shorter than stalk, Ovaries smotl: 5691 Leaves ternate stalked, Leaf. roundish obovate, Stipules setaceous obsolete

5692 Leaves oblong obovate on both sides with the calyxes silky, Pedunc. one-f, as long as leaves
5693 Leaves oblong obovate on both sides with the calyxes silky, several times longer than the 1-flow. fl-stalk
5694 Leaves cuneiform emarginate silky, Pedunc shorter than leaf
5695 Leaves oval silky on both sides shorter than 2 -fl. peduncle, Cal. downy rough
5696 Lvs, oval and obov. pubes. beneath netted : when full-grown not silky, Cal vill. witha scarious ref. limb
5697 Leaves ovate reticulate, Branches hairy angular striated, Peduncles as long as leaves
5698 Leaves simple ovate downy, Fl, axillary, Peduncles longer than leaf
5699 Leaves elliptical-lanceolate, Peduncles 1-f. shorter than leaves, Calyx deeply split
5700 Leaves villous stalked: upper ovate; lower roundish, Cal. villous with segments as long as wings
5701 Leaves cordate roundish subsessile very villous, Segments of villous calyx shorter than wings
5702 Leaves pinnatifid-toothed spiny oblong-lanceolate : with an entire point longer than the teeth 5703 Leaves sinuate-toothed spiny oblong obtuse, Bractes below the end of stalk
5704 Leaves entire flat mucronate : lower rhomboid orbicular ; the upper elliptical lanceolate
5705 Lvs. opp. spiny toothed 3-lobed with a transverse base, Lateral lobes much shorter than term. toothed one
5706 Leaves lin. lanc. Bractes adhering to top of the footstalk, Corymb. clust. Pods scarcely longer than caI. 5707 Leaves oval. obl. Bractes deciduous below the end of footstalk, Corymb. clust. Pods twice as long as cal. 5708 Leaves ovate cordate hairy, Umb, terminal sessile

5709 Leaves lanceolate acrite
5710 Leaves ternate obovate mucronate silky beneath
5711 Leaves ovate flat, Standard oblong obovate
5712 Leaves elliptical wavy mucronate, Standard oblong cordate

and Miscellaneous Particulars.
Holland, at the foot of the mountains, in a loamy soil, near a spot where, after having been tantalized with finding many salt springs, his party had just met with an ample supply of fresh water. This welcome refreshment, of which he speaks feelingly in his book, seems to have suggested a name for this plant, which he had properly determined to constitute a new genus. He called it Chorozěma, evidently from xogos, a dance or joyous assembly, and そeнผ, a drink, in allusion to the circumstance just mentioned. (Smith.)

This genus ripens abundance of seeds, from which it may be readily increased, and also by young cuttings in sand under a bell-glass.
950. Podolobium. This and the succeeding names ending in lobium, refer in that part of their derivation to their pod; this genus is called from \(\pi 85\) rodos, a foot, the pod being on a stalk. The species may be treated as Chorozemia.
951 . Oxylohium. From o豸ves, pointed, the pods being pointed. See Podolobium.
959. Callistachys. From zaio5, beautiful, and 50\% \({ }^{2}\) 5, a spike, in reference to the fine spikes of yellow flowers. These are handsome conservatory shrubs, which grow rapidly and flower freely. They may ve raised from seeds or cuttings in sand under a bell-glass.
353. Brachysema. From \(\beta\) eoxus, short, and \(\sigma\) nux, a standard. The standard of the flower of the genus is very short. This is a handsome climber, increased by layers, cuttings in sand, or by secds.

History，Use，Provagation，Culture．
954．Gompholobium．The name of this genus alludes to the tumid shape of the legume，which swells from a narrow base upwards；according to the primary signification of youøos，a word thence used to signify a club or wedge，or any thing formed upon a similar principle．Delicate plants，difficult to preserve，requiring a large proportion of sand in the peat，and moderate watering．Young cuttings root under a bell－glass in sand．
955．Burtonia．A genus defined in the Hortus Kewensis，without an explanation of the origin of the name． This plant，Sweet observes，requires more than ordinary treatment to keep it in good health；an equal mixture of very sandy loam and peat is the best soil for it，and the pots to be well drained with small potsherds，that the water may pass off freely，as nothing is more injurious to it than too much water．Young cuttings are not difficult to root，planted in sand under a bell－glass；it may also be raised from seeds，which are sometimes pro－ duced．（Bot．Cult．156．）
956．Jacksonia．Named after Mr．Jackson，formerly librarian to Aylmer Bourke Lambert，and an excellent practical botanist，of whom too little is known．Young cuttings will root in sand under a bell－glass，or ripened ones under a hand－glass．
957．Viminaria．From vimen，a twig．The appearance of the species which have no leaves is that of a bundie of naked twigs．

5713 Leaves term. Leaf. lin. or obl, lin, an inch and more long, Stem erect, Keel fringed, Cal. in fruit reflexed
5714 Leaves ternate linear mucronate straight, Branches angular smooth
5715 Leaves ternate, Leaf. obovate edged flat, Stipules as long as leafstalk, Cor. length of calyx
5716 Lvs. tern. and quinate, Leaf. linear recurved at edge, somewhat dilated at end, Stem procum. or twining
5717 Leaves ternate linear smooth mucronate, Branches round hairy, Keel hairy
5718 Leaves pinn. Leafi. subulate linear mucronate rough above, Cal. hairy shorter than pod, Keel silky ciliate 5719 Leaves pimn. of many pairs, Leaf. subulate veiny revolute at edge and calyxes smooth, Cor, purple

5720 Leaves ternate, Cal. smooth, Style beyond the middle beardless
5721 Arborescent unarmed, Branches angular, Racemes terminal
5722 Shrubby, Branches spiny 2-3-chotomous spreading angular, Bractes very short
5723 Segments of calyx straight ovate
5724 Flowers racemose, Segments of calyx lanceolate reflexed
5725 Tube of cal. a little shorter than lips, Style included bowed from the base, Cor. yellow 5726 Tube of cal. twice as short as the lips, Cor. red

5727 Cal. silky with appressed hairs, Pods stalked, Seeds dotted rugose, Leaves rough above
5728 Flowers axillary ternate, Leaves subulate mucronate
5729 Corymbs terminal sessile, Leaves subul, rough with dots divaricate twisted, Branches pubescent 5/30 Corymbs terninal stalked, Leaves filiform erect smooth, Mucro weak recurved
5731 Leaves short spreading decussate, Fl. capitate, Pedunc. with two bractes, Stigma capitate
5732 Corymbs terminal sessile, Leaves filiform erect, with a weak short point, Branches silky
5733 Leaves acerose borizontal, Branches weak, Heads 3-9-flowered
5734 Leaves lanceolate or lanceolate-obovate, Peduncles axillary twin, Appendages of wings very short
5735 The only species
5736 Lvs. beneath somew. silky retuse, Lobes round. longer than little point, Stalk of pod as long as tube of cal.
5737 The only species

5738 Heads terminal, Leaves obovate oblong flat quite smooth 3 times as long as broad, Point pungent 5739 Heads term. Leaves cuneate obcord. retuse fiat smooth scarcely twice as lolg as broad, Point pungent 5740 Heads term. few-fl. Leaves cuneate truncate bristly pointed recurved at edge rough above villous beneath 5741 Heads term. Leaves linear retuse blunt flat smooth, Bractes a little longer than cal.
5742 Heads term. Leaves obovate mucronate smooth, Stem upright, Calyx and ןods hairy
5743 Bractes shorter than 6-8-fl. head, Lvs. lin. with a little point and recurv. edge, Stip. shorter than footstalk
5744 Leaves linear mucronate revolute recurved at end, Stipules solitary 2 -nerved with membr, torn sheaths
5745 Heads many-fl. Bractes about as long as cal. Leaves flat linear acute, Stipules bitid fat imbricated 5746 Fl. axill. Leaves linear lanceolate mucronate smooth, Stip. imbric. ciliated, Cal. and bractes bearded 5747 Racemes leafy, Leaves linear oblong, above concave, beneath cal, and branchiets pilose

and Miscellaneous Particulars.
358. Spharolobium. From \(\sigma\) фasgo, a sphere; the pods being nearly spherical. See Jacksonia.
959. Aotus. From \(\alpha\), privative, and wra, ears, in allusion to the want of the appendages to the calyx in this genus. In l'ultenaa, to which it is most nearly allied, they are very distinct.
960. Dillwynia. Named by Sir James Edward Smith, after Mr. Lewis Weston Dillwyn, whose labors upon Confervæ and other parts of British botany are well known. These plants being liable to suffer from wet, the pots must be well drained with sherds and refuse peat siftings. Young cuttings root freeiy in sand under a bell-glass.
961. Eutaxia. From \&uta乡io, modesty, in allusion to the humble, modest appearance of the plant. Mr. Sweet directs to top the plants frequently when young, otherwise they are apt to run up naked and unsightly.
962. Sclerothamnus. From orzגngos, hard, and \(\mathcal{A} \alpha \mu v o s\), a shrub. The species are rigid plants with stiff hard leaves.
963. Gastrolobium. From \(\alpha_{5}{ }^{n} \rho\), the belly; or, in botanical composition, something inflated. The pods of the genus are much swollen.
964. Euchilus. From \(\varepsilon v\), well, and \(\chi \in \curvearrowleft \lambda o s\), a lip; well lipped. The upper lip of the calyx is very large.
905. Pulfena: Named after William Pulteney, M. D., author of a view of the writings of Limnaus, and

History, Use, Propagation, Culture,
of various other works of merit. These are small New Holland bushes, with numerous yellow flowers, frequently brown on the outside.
966. Davicsia. Named after the Rev. Hugh Davies, a Welsh botanist. Plants like furze. The species root best when the cuttings are somewhat ripened and planted in pots of sand, and covered with a hand.glass without bottom heat.
957. Mirbelia. In honor of Mr. Mirbel, a distinguished French physiological botanist, whose elucidations of the reticulated structure of vegetables make it proper to consecrate to his merits plants remarkable for their reticulation.
968. Cercis. Kęzss is a name of Theophrastus, supposed to have appertained to the tree now so called. Gainier or Arbré de Judée, Fr., Arbold Amor, Span. Handsome low trees, with singular leaves and fine shewy flowers. These having an agreeable poignancy, and being abundant on the branches, are frequently eaten in salads on the continent, and those of the C. canadensis are pickled by the French families in Canada. The wood of both species is finely veined with black and green, and takes a good polish; and the young branches of the Canadian species are said to dye wool of a fine nankeen color. They may be propagated either by layers or seeds: the latter make the best plants. Gerarde, in compliance with the popular notions of his time, says, "this is the tree whereon Judas did hang himselfe; and not upon the elder tree, as it is said."
969. Schotia. So named by Jacquin, in memory of Richard van der Schott, a Dutchman, gardener at Schoenbrunn, and his companion in his travels. This beautiful genus has lately been increased by Burchell, the A frican traveller. "They require," Sweet observes, "rather more warmth than a common greenhouse, to keep them in good health through the winter. The coldest part of the stove will suit them better; but they should not be plunged in the tan, as they want no bottom heat. A mixture of loam and peat is the best soil for them; and cuttings planted in sand, and plunged in mould (not in tan), under a hand-glass, will strike root." (Bot. Cult. 1U.5.)
970. Bauhinia. So named by Plumier, in honor of the two famous botanists, John and Caspar Bauhin. The species cansist of trees or shrubs, most of them climbing. The leaves are simple, but two-lobed or two-

5748 Very smooth, Fl. axill. Leaves oblong linear mucronate flat
5749 Heads terminal 2-flowered, Fruit lateral, Leaves subulate linear hairy above concave
5750 Heads terminal few-fl. Leaves wedge-shaped at the end dilated 2-lobed above rough beneath silky

\section*{5751 Leaves linear revolute pungent straight rough, Flowers axillary solitary}

5752 Branches spiny smooth spreading, Leaves lanceolate or linear, Pedunc. axill. 1-fl. Bractes 8 imbricated 5753 Leaves linear oblong flat pointless, Pedunc, axill, twin corymbose many-fl. Calyx regular
5754 Branches unarmed, Lvs, long-lanc. with a very short weak point, Corymbs axill. Upper lip of calyx retuse
5755 Branches unarmed, Leaves ellipt. or oval veiny attenuated at base, Racemes axillary many-fi.
5756 Stem leafless winged, Umbels lateral, Calyx and braçtes fringed
5757 Leaves lanceolate linear veiny, Ovaries 2-seeded
5758 Leaves wedge-shaped at the end dilated-trifid
5759 Leaves orbicular cordate
5760 Leaves cordate acuminate
5761 Leaves 7-10 pairs oval-lanceolate mucronate, Stipules subulate
5762 Leaves 8 -10 pairs oval obtuse mucronate or not, at the base in front a little swoilen
5763 Leaves 5 pairs oval acute mucronate, Stipules half-ovate falcate mucronate
5764 Stem tendril-bearing, Lobes of leaves attenuated
5765 Stem tendril-bearing, FL. triandr. on outside with stam. at base hairy, Lvs. downy beneath, Lobes rounded 5766 Stem prickly
5767 Leaves smonth, Lobes divaricate acute 2-nerved, Petals lanceolate
5768 Leaves at the base nearly transverse, Lobes lanceolate porrect 3-nerved, Petals lanceolate
5769 Leaves cordate, Lobes porrect acute 3-nerved, Petals lanceolate
5770 Racemes axill. and term. nodding, Petals limear, Lobes of leaves rounded smooth
5771 Cal. 1-leaved bursting, Petals sessile ovate, Lobes of leaves ovate obtuse
5772 Leaves cordate downy beneath, Lobes ovate obtuse, Cal, narrowed upwards lengthened
5773 Flowers triandrous, Lobes of leaves oval obtuse
5774 Leaves cordate, Lobes half orbicular downy
5775 Leaves ovate, Lobes acuminate half-ovate spreading
5776 Stem prickly, Leaves cordate with porrect 4-nerved lobes
5777 Leaves alternate abruptly pinnated, Pod woody, Seeds black with a scarlet arillus
5778 Leaflets coriaceous veinless unequal at base, Flowers of panicle stalked
5779 Leaves veiny unequal at base, Panicle wavy spreading, Pedunc. many-fl. Pods warted

and Miscellaneous Particulars.
parted, which circumstance gave occasion, it is said, to Plumier to name this genus from the two brothers, They merit a place in the stove, where they are easily cultivated in light loamy soil, and cuttings taken off when the plants are in a growing state, not over ripened, nor yet quite succulent, with their leaves on, will do well in sand under bell-glasses in moist heat. The species rarely flower in this country. In their native woods they are great ornaments of the trees, among which they climb in every direction. The stem of Bauhinia scandens, which had twined around a smaller plant, is said to have been the origin of 太sculapius's snaken rod, which he brought from India.
971 . Afzelia. Named by Sir J. E. Smith, after Dr. Adam Afzelius, an amiable and excellent Swedish botanist, resident for many years, in the service of the African Company, at the colony of Sierra Leone, and now living at Upsal.
972. Hymencer. A poetical application of this plant, the leaves of which grow in pairs, to Hymen, the god of marriage. Courbaril is a vernacular American name. This tree is abundant in the West Indies, where it grows to a large size, with a spreading head. It has stiff sub-perfoliate leaves obliquely placed, and terminal spikes of flowers, which are succeeded by thick, fieshy, brown pods, shaped like those of the garden bean; they are six inches long, and two inches and a half broad, of a purplish brown color, and a ligneous consistence, with a large suture on both edges; they contain three or four roundish compressed seeds, divided by transverse partitions, and inclosed in a whitish substance of fine filaments, as sweet as honey. The Indians eat this substance with great avidity, though it is apt to purge when fresh gathered, but it loses this quality as it grows old.

Between the principal roots of the tree exudes a fine transparent resin, yellowish or red, which is collected in large lumps, is called gum Anime, and makes the finest varnish that is known, superior even to the Chinese lacca: for this latter use it is dissolved in the highest rectified spirits of wine. It burns readily, and with a clear flame, emitting a grateful and fragrant smell, for which reason it is sometimes ordered by way of fumigation in the chambers of persons laboring with asthmas or suffocative catarrhs. Its vapours not only strengthen the head, but all parts of the body affected with cold. Some apply it outwardly, dissolved in oil or spirits of wine, to strengthen the nerves. An oil may be distilled from it, useful in palsies, in cramps, and

\section*{History, Use, Propagation, Culture,}
contractions of the sinews. The solution in spirits has been thought not inferior to Guaiacum in venereal cases. A decoction of the leaves expels flatulency, and gives ease in colicky pains, by gently opening the bowels; and the inward bark is an excellent vermifuge in substance or decoction.

The tree is excellent timber ; but it must be very old before it is cut, otherwise the heart will be but small. It is in great request for wheel-work in the sugar-mills, particularly for cogs to the wheels, being extremely hard and tongh: it is so heavy, that a foot cube weighs about a hundred pounds, and it will take a fine polish. It is much inl?abited by wild honey bees, (7rowne.)
Besides this locust-tree, there is the American tree of that name, Robinia Pseud.acacia, and the locust-tree of scripture, Ceratonia siliqua.

\section*{5780 Flowers growing upon the trunk}

5781 Leaves 1 pair and calyxes smooth, Stipules cordate-lanceolate
5782 Leaves 2 pairs obovate, Two subulate glands between the lower pair
5783 Leaves 2 pairs ovate oblong acuminate, An obl. gland between the lower pair, Spines obsolete 3-toothed 5784 Leaves 2 pairs ovate oblique, An obtuse gland between the lowest, Racemes axill. stalked
5785 Leaves 3 pairs: with a gland on the footstalk, Stipules ciliate cordate acuminate
5786 Leaves 3 pairs obovate: outer largest, A subulate gland between the lower pair
5787 Leaves 3 pairs obovate smooth: the inner roundest with a globose gland between
5788 Leaves 3 pairs, Leaflets obtuse elliptical, A gland between the lower leaves
5789 Leaves 3 pairs, Leaflets ovate acuminate, A sessile gland between the leaflets
5790 Leaves 3 pairs ovate acuminate with soft down on each side
5791 Leaves 3 pairs lanceolate subfalcate smooth, A gland between the lowest, Corymbs stalked, Pods cylind.
5792 Leaves about 4 pairs ovate, Flowers racemose irregular, Stem arborescent
5793 Leaves 3 pairs obovate obtuse beneath very villous outer largest, A gland between lowest, Pods recurved
5794 Leaves 3 or 4 pairs obovate the outer largest, A gland between the lower pairs, Pods pendulous rounded 5795 Leaves 4 pairs ovate hairy with a subulate gland between the leaflets, Peduncles t-flowered
5796 Leaves 4 pairs obovate pubescent ciliated, A stalked gland between all, Pedunc. 4-fl. Pod jointed
5797 Leaves 4 or 5 pairs oblong obtuse : the outer the largest with a gland between every pair
5798 Leaves 5 pairs ovate lanceolate rough at edge: outer largest, A gland at foot of leatstalk
5799 Leaves 5 pairs oblong acute smooth, A gland at base of footstalk, Branches smooth
5800 Leaves 5 pairs elliptical smooth with an obl. gland between the lower, Stip, subul. falcate, Rac. axillary
5801 Leaves 5 pairs elliptical smooth, An oblong gland between the lower, Racemes axillary
5802 Leaves 5 pairs cordate obtuse, Stalks without glands
5803 Leaves 6 pairs obovate smooth, Stalks without glands, Spikes racemose, Pods leafy compressed falc .te
5804 Leaves 5 pairs lanceolate equal, Gland above the base of the leafstalks
5805 Leaves 6 pairs ovate lanceolate smooth with a gland at the base of the stalk, Pod compressed edged
5806 Leaves 8 - 9 pairs ovate lanceol. hairy with a gland at base of stalk, Racemes many-fl. shorter than leaves
5807 Leaves 6 pairs lanceolate acute the outer largest, A gland on leafstalk, Peduncles 2 flowered
5808 Leaves 6 pairs obl. smooth: lower smaller with a subulate gland between the lowest, Stalks 2-flowered
5809 Leaves 6 pairs ovate acute smooth, with a gland at the base of the stalk, Pod cylindrical hooked
5810 Leaves \(5-6\) pairs ovate acuminate woolly : the outer largest
5811 Leaves 6 or 8 pairs lanceolate acute smooth, with a gland on the leafstalk, Pod round smooth
5812 Leaves 2 pairs obovate veiny, Stipules lanceolate appressed, Leaflets nearly equal
5813 Leaves 10 pairs oblong obtuse without glands, Racemes long, Bractes ovate tumid imbricated
5814 Leaves \(6-8\) pairs linear obliquely rounded at base above hairy, Panic. axillary, Pod villous
5815 Leaves in many pairs with many glands, Stipules subulate
5816 Leaves 2 pairs velvety without glands
5817 Leaves 5 pairs ovate lanceolate smooth with a gland at the base of the leafstalk
5818 Leaves 6-9 pairs lanceolate acuminate smooth, A gland on the leafstalk
5819 Leaves 8 pairs ovate-lanccolate, A gland between the lower, Stipules ovate very large
5820 Leaves 10 pairs ovate-lanceolate obtuse mucronate smooth, Stalk without gland
5821 Leaves 8 pairs ovate-oblong equal, Gland at the base of the leafstalk
5822 Leaves 8 pairs oval-oblong : the outer smaller, Leafstalks without glands, Stipules spreading
5823 Leaves 7 pairs lanceolate : the outer smallest, A gland at base of leafstalk
5824 Leaves 6 pairs oval-obl, obt, hairy: the outer largest, A subulate gland between each pair, Pods linear 5825 Leaves 9 pairs oval-obl. smooth oit. A cylindrical gland between the lowest, Footst. with no gland at base 5826 Leaves 10 pairs lanceolate with an oblong gland at the base
5827 Leaves 10 pairs, Leaflets oblong rounded at each end beneath hoary, No gland on stalk, Pod compressed 5828 Leaves 12 pairs obtuse mucronate, Glands many subulate, Stipules reniform bearded
5829 Leaves many pairs, Gland of the footstalk stalked, Stipules ensiform
5830 Branches hairy, Stipules lanceolate linear with elevated lines, Leafiets cuspidate
5831 Leaves 15 pairs, Leaflets with a cartilaginous white edge and a subulate gland between every pair
5832 Leaves many pairs linear with an obsolete gland at the base of the leafstalk, Stipules setaceous
5833 Leaves many pairs linear mucronate with a gland between the lowest, Pedunc, solitary 1-fl.
5834 Leaves many pairs, Flowers pentandrous, Stem erect
58:35 Leaves many pairs linear, Stem flexuose erect villous.
The plant in Bot. Cab. is something else?
5836 Leaves many pairs without glands, Stem procumbent

and Miscellencous Pariiculars.
973. Cynometre. A name contrived to indicate the peculiar form of the poils of this genus, which grow from the old stems and branches of the tree. Large cuttings reot best planted in sand, and plunged in heat under a hand-glass.
974. Cassia. According to Olaus Celsus, this name is to be traced to the Hebrew, Ketzioth, rendered by Karacey in the Septuagint, and Latinized by Cassia. Cuttings of the specics, which do not seed freely, root in pots of sand, in moist heat, and covered by a hand-glass.
Of the trivial names of different species of Cassia, that of Abskis is the name under which it is descriked by Professor Alpinus, and is supposed to have arisen from a river of Palestine of that name. Tagcra is a Malabar name, Sophera, an Egyptian name, and Senna, the Arabic name of the plant - Socnna.

History, Use, Propagation, C'ulture,
 cathartic. The species may be treated as Cassia.
976. Parkinsonia. So named by Plumier, in memory of John Parkinson, apothecary, of London, author of Paradisus Terestris, 1629 , and Theatrum Botanicum, 1640. It is a handsome low tree, not unlike the Laburnum, and planted in the West Indies near houses, as the latter is in this country.
977. Poinciana. So named by Tournefort, in memory of De Poinci, governor of the Antilles, placed by Linnæus among the promoters of botany.
P. pulcherrima is a low spiny tree, with an odor, when the leaves are bruised, like savin. It is a native of both Indies, and in Barbadoes is planted in hedges, whence the name of flower-fence, or Spanish carnations, which it is there called. In our stoves they require a strong heat to make them flower well. They are readily increased either by cuttings or seeds.
978. Casalpinia. So named by Plumier, in honor of Andreas Casalpinus, chief physician to Pope Clement VIII., and the father of systematic arrangement in plants, in his now very scarce work, entitled, De Plantis, libri sedecim, Flor. 1583. He died at Rome in 1602. The wood of all the genus may be used in dying. In our stoves the plants are thorny, and, therefore, not being much liked, are seldom suffered to grow large enough to flower freely.
C. sappan is a prickly tree, with the heart of the wood red, heavy, and very hard : it dyes a beautiful red, which, however, is said not to stand. It is very durable in sea-water, and exported abundantly by the Chinese for trenails in ship-building, and as a dye.
C. crista and brasiliensis afford the Brazil wood used in dying, and extensively imported to England from the West Indies. The timber of the last species is elastic, tough, and durable, and takes a fine polish ; it is of a beautiful orange-color, full of resin, and yields a fine fuli tincture by infusion. The best Brazil wood is said to be produced by Cæsalpinia echinata. Cuttings, Sweet observes, will not root freely, but will sometimes succeed if taken off in a growing state, but not too young, and plunged in a pot of sand, under a hand-glass, in moist heat. (Bot. Cult. 32)
979. Guilandina. Named after Melchior Guilandin, a Prussian traveller in Africa, and demonstrator of Botany at Padua. He died in 1590. The species are all fine trees, with large compound leaves.
980. Hypcranthera. From ivध , upon, and ay, q̧a, an anther. The five barren stamens of this

and Miscellaneous Particulars.
genus are surmounted by the five fertile ones. (Vahl.) Cuttings root best under a hand-glass in sand.
981. Hoffmanscggia. Named by Cavanilles, after John Charles Hoffinansegg, whom he calls a distinguished naturalist. It may be with some propricty be employed to commemorate the merits of the present distinguish. ed Count Hoffmansegg. Cuttings, somewhat ripened, root under a hand-glass in sand.
982. Adenanthera. From ajnv, a gland, and ay \(9 n \rho \alpha\), an anther. The essential character of the genus is to have each anther tipped with a gland. Large cuttings, with the leaves notshortened, root best in a pot of sand plunged in heat under a hand-glass. (Bot. Cult. 13.)
983. Cadia. Contrived by Forskahl, from the Arabic name of the plant, - qadhy.
984. Prosopis. One of the names under which Dioscorides described the Arctium Lappa. The present plant has no sort of resemblance to that of the ancients. It is a leguminous plant, and the pods are eaten as a condiment in India.
985. Hcematoxylon. From \(\dot{c} / \mu \alpha\), blood, and \(\xi_{\nu} \lambda \epsilon v\), wood, in allusion to the color of an infusion of its wood, The iggwood of commerce. This is a crooked stemmed low tree, with pinnate leaves, originally from the Bay of Campeachy; the inner bark and wood red, the latter dark and very hard. It makes an excellent fence, the smaller shoots are cut for hoops, and the stems for exportation for dying. The gum is a gentle subastringent. In our stoves it grows well in loam and leaf-mould, kept rather moist, and cuttings root in sand under a handglass in heat.
986. Copaifera. This tree is so called from bearing the drug Copaiba, which is the name given to the tree itself by the people of Brazil. Beaume de Copahu, Fr., Kopaiva Balsam, Ger., Balsamo del Coppaiba, Ital, This is a lofty elegant tree, with a handsome branching head, the extreme branches flexuose at the axils, the bark ash-colured, and the leaves pinnate. It grows abundantly in the woods of Tolu, near Carthagena, and of Quito, in Brazil. The copaiba balsam of the shops is procured by wounding or boring these trees to the pith, near the base of the trunk, when it flows abundantly, in the form of a clear colorless liquid, which is thickened, and acquires a yellowish color by age. The operation is performed two or three times in the same year; and from the older trees the best balsam is obtained.

Copaiba balsam is stimulant, diuretic, and gently purgative. It has been recommended in pulmonary complaints, and it certainly affords considerable relief in hæmorrhoidal affections. (Thompson's London Disj. ensafory, 265.) It may be increased by ripened cuttings in sand under cover.

> History, Use, Propagation, Culture,
987. Trichilia. From \(\tau_{巳} \downarrow \chi x\), ternary, nearly all the parts of the plant, the leaves, the stigmas, the cells of capsule, the seeds, being produced by threes. T. glabra is a tall branching tree, with an unpleasant foetid smell. The species are rarely seen in collections, and seldom, when cultivated, flower.
988. Melia. M\& to resemble the ash in its foliage.
M. azedarach (azadaracht, Arab.) grows to a large tree in the south of Spain and Italy, producing long loose bunches of blue flowers, succeeded by pale yellow berries, about the size of a cherry. These berries consist of a pulp, which is poisonous in a high degree, and mixed with grease, will kill dogs, enclosing a nut which is bored and strung as beads by the Catholics.
M. sempervirens is considered by some as only a variety of the Azedarach.
089. Quivisia. The tree is called Bozs de Quivi in the Isle of France.
990. Swietenia. So named by Jacquin, in honor of the illustrious Gerard L. B. Von Swieter, archiater to Maria Teresa, Empress of Germany, who at his persuasion founded the botanic garden at Vienna.
S. mahagoni. The mahogany tree is a lofty branching tree, with a wide handsome head, the flower of Melia, and the fruit of Cedrela, about the size of a turkey's egg. It grows in the warmest parts of America, as in Cuba, Jamaica, Hispaniola, \&c. The trees on the Bahama islands are not so large, but are more curiously veined, and are known in Europe as Madeira wood. They generally grow on the solid rock, where there seems to be no earth for their nourishment. Mahogany, like other timber, varies in durability, firmness of grain, and other circumstances, with the soil on which it is grown. The best is furnished from the rocky soils of St. Domingo and the Bahama islands.
\(S\). febrifuga is a lofty tree, in general apearance like the Mahogany. The wood is of a dull red color, remarkably hard and heavy; it is reckoned by the natives the most durable wood they know, and on that account is used for all the wood-work in their temples; it is also very serviceable for various other purposes. The bark is internally of a light red color: a decoction of it dyes brown of various shades, according as the cloth has been prepared. Its taste is a bitter and astringent united, and very strong, particularly the bitter; at the same time not any way nauseous or otherwise disagreeable. In India it is used for the cure of intermittents with considerable advantage, and has also been found efficacious in most of the diseases in which the cinchona bark proves serviceable. (Thompson's London Dispensatory, 533.)
991. Ekelergia. Charles Gustavus Ekeberg was a Danish naturalist, who travelled in Asia from 1770 to 1771. Cuttings to succeed must have their leaves entire, and be planted in sand and covered.
992. Hcynea. Named after Dr. Benjamin Heyne, a learned German botanist and physician, who travelled many years in India, where he formed a large collection of dried plants.
993. Guaiacum. From guaiac, the name given to the tree by the natives of Guiana. Gijuac, Fr., Gujakgummi, Ger., Gujaco, Ital. This tree rises forty feet high, and is four or five feet in circumference, with many divided knotted branches, greyish bark, and abruptly pinnate leaves. It has blue flowers, which are succeeded by compressed berries of a roundish form. The tree takes many years to arrive at its full growth. The roots run far into the ground perpendicularly, contrary to the usual growth of timber trees in the West Indies, which generally shoot the largest prongs of their roots in a horizontal direction, and are commonly observed to run very near the surface. The bark is thick and smooth, the wood of a dark olive color, and cross grained, the strata running obliquely into one another, in form of an X . It is a valuable timber where

5860 Leaves pinnated smooth, Outer leaflets largest
5861 Leaflets lanceolate undulate, Flowers with 4 petals
5862 Leaves bipinnate, Leafiets smooth somewhat quinate
5863 Leaves bipinnate, Leaves cut rugose shining about 9 , Petiole rounded at base
5864 Leaves pinnate
5865 Leaves alternate oval and obovate entire sinuate-toothed or pinnatifid, Pedicels twin axillary 1-flowered
5566 Leaves pinnate in four pairs, Leaflets ovate-lanceolate equal at base, Panicles axillary 5867 Leaves pinnate in four pairs, Leaflets elliptical roundish emarginate unequal at base, Panicle terminal

5868 The only species, Leaves pinnated with an odd one, Panicles axillary
5869 Leaves pinnated with an odd one in 3 pairs, Pan, axill. on long stalks

5870 Leaflets of 2 or 3 pairs obtuse, Capsules 2-celled

5871 Leaves simple opposite sessile roundish
5872 Leaves conjugate stalked, Leaflets obovate, Peduncles erect, Calyx smooth
5873 Leaves conjugate stalked, Leaflets obovate, Flower nodding, Calyx pubescent
5874 Leaves conjugate stalked, Leaflets linear-lanceolate
5875 Leaves conjugate stalked, Leaflets clavate fleshy with a cobweb surface

and Miscellaneous Particulars.
strength and duration is required, and weight no object. It takes a fine polish, turns well, and is much used for ship blocks. It is one of the most valuable trees of the West Indies; since the timber, the bark, fruit leaves, and blossom, are all applicable to some useful purpose. The wood yields by incision the peculiar substance called Guaiacum, erroneously termed a gum, of great importance in medicine.
All the parts of this tree possess medicinal qualities; but the wood and the peculiar substance afforded by it are the only parts used: the virtues of the wood depend altogether on the peculiar matter it contains. This is spontaneously exuded from the tree, and is called native gum: it concretes in tears, which are semipellucid, and very pure; but the greater part of it is obtained by making incisions into the trunk, or, as it is termed, jagging the tree. This operation is performed in May ; and the juice which flows copiously, is concreted by the sun. It is also obtained by sawing the wood into billets, and boring a hole longitudinally through thera; so that, when one end of a billet is laid on a fire, the guaiac melting runs through the hole from the opposite end, and is collected in a calabash. Boiling the chips or raspings in salt and water also separates the guaiac, which, as it rises to the surface, may be collected by skimming.

Both the wood and the guaiac are stimulant, diaphoretic, diuretic, and purgative. The wood was introduced into Europe by the Spaniards as a remedy for lues venerea in 1508, and gained much celebrity from curing Van Hutten; but it had long before been used for the same purpose by the natives of St. Domingo It obtained so much reputation, that the exhibition of mercury was discontinued for a considerable length of time, and even in the eighteenth century its specific powers over this disease were maintained by Boerhaave; but frequent disappointments and more correct observations have shown that it possesses no powers of eradicating the venereal virus; and that it is useful only after a successful mercurial course, for repairing the strength and vigor of the system, "and where a thickened state of the ligament, or of the periosteum, remains, or where there are foul indolent ulcers;" (Pearson's Observations, \&c. p. 10.) or in suspending the progress of some of the secondary symptoms for a short time, as ulcers of the tonsils, eruptions, and nodes. The decoction of the wood has been found more useful in cutaneous diseases, scrofulous affections of the membranes and ligaments, and in ozæna. The guaiac itself is an efficacious remedy in chronic rheumatism and arthritic affections, as well as those diseases for which the decoction of the wood is usually given; and in every respect it may be regarded as the active ingredient of the wood. Its sensible effects are a grateful sense of warmth in the stomach, dryness of the mouth and thirst, with a copious flow of sweat, if the body be kept externally warm, or if the guaiac be united with opium and antimonials: but when the body is freely exposed, instead of producing diaphoresis, it augments considerably the secretion of urine. (Thomson's London Dispensatory, 318.)
Lignum vitæ in the stove grows freely in loam and peat. "Cuttings," Sweet observes, "are generally supposed to be difficult to root; but I find ripened cuttings, taken off at a joint, root readily, planted thin in a pot of sand, and plunged under a hand-glass in heat. When the cuttings are rooted, which will be easily perceived by their growing at the top, they should be potted off; when great care must be taken not to break off the young roots in taking the sand from them, as they are very small and easily broken. Pot them off in very small pots, and keep them under a close glass or a few days, till they have struck fresh root, when they must be exposed to the air by degrees." (Bot. Cult. 63.)
994. Zygophyllum. From گuyos, a pair, and \(\varphi \nu \lambda \lambda a v\), a leaf; all the leaves grow in pairs. Morgsana, which is the name of one species, is the Syrian name of the plant. These are plants of little ornament, generally with fleshy le:ives, and flowers of a yellow or whitish yellow color.

\section*{History, Use, Propagation, Culture,}
995. Fagonia. So named by Tournefort, in honor of Mons. Fagon, archiater to Louis XIV., and a great patron of botany. Small prickly plants of no beauty.
996. Tribulus. From \(\tau \varrho \varepsilon \varsigma\), three, and fonos, a point, in reference to the points of the capsules. La Croix du Chevalier, Fr. The term Caltrops is taken from the form of the fruit, which resembles the machines that were formerly cast in the way to obstruct an enemy's cavalry. It is composed of five nuts, united into a subglobular whorl armed with prickles.
T. terrestris is a native of most of the hot and temperate parts of the world : it is common about Kingston in Jamaica, where it is called Turkey iorossom, and planted in gardens for the sake of its flowers, which have an agreeable smell. The fowls are observed to feed much on them, which is thought both to fatten them and heighten their flavor. In the south of Europe, it is a common weed in arable land, and is troublesome to cattle by the prickly fruit running into their feet. All the species are pretty, though seldom cultivated,
997. Dictamnus. An ancient name of what is now supposed to be the Origanum Dictamnus. Fraxinella, Fr., in allusion to the remarkable similarity which exists between the leaves of the plant and Fraxinus, the ash. The whole plant, especially when gently rubbed, emits an odor like that of lemon-peel, but when bruised it has something of a balsamic scent. This fine scent is strongest in the pedicels of the flowers, which are covered with glands of a rusty red color, exuding a viscid juice or resin, which exhales in vapor, and in a dark place may be seen to take fire. The root is used in medicine, and, it is said, with much success, as an opiate and drastic.
998. Ruta. This name is nearly the same in all languages. Purn, in Greek; Ruta, in Latin; rux, in Runic; rude, rutn, or rutu, in Anglo-Saxon; rutiza, in Sclavonic; in French and English, rue, \&c. The root of the word is beyond the ingenuity of etymologists. R. graveolens was formerly in much repute as a medicinal plant, and also as emblematical of repentance and grace. In Shakspeare and other old authors, it is called herb of grace, as rosemary is called herb of remembrance. The leaves have a powerful unpleasant odor, and a hot, bitter, nauseous taste. In the recent state they will inflame and blister the skin ; but much of this is dissipated in drying. Medicinally, rue is stimulant and antispasmodic, and is supposed to possess emmenagogue powers. It was in high estimation as early as the time of Hippocrates, who frequently ordered it in female complaints. In modern practice, it is chiefly used in hysteria and flatulent colic. (Thomson's London Dispensatory, 487.)
999. Crowea. So named by the president of the Linnean Society, after his friend James Crowe of Norwich, an excellent British botanist, whose collection of willows we believe still exists. This plant continues in flower the greater part of the year. An equal mixture of sandy loam and peat is the best soil for it, and care must be taken not to over water it, or it will look yellow and unhealthy. It likes an airy situation,

5876 Leaves conjugate stalked, Leaflets obovate, Stem shrubby
5877 Leaves conjugate sessile, Leaflets lanceolate oval rough at edge, Stem shrubby
5878 Leaves with double leaflets stalked, Leaflets cylindrical fleshy smooth, Petals acuminate
5879 Spiny, Leaflets lanceolate flat smooth
5880 Spiny, Leaflets linear convex
5881 Leaflets in 4 pairs : the outer larger, Pericarps 10 -seeded blunt
5882 Leaflets in 6 pairs nearly equal, Seeds with four horns
5883 Leaflets in 8 pairs nearly equal
5884 Leafstalk obscurely edged
5885 Leafstalk scarcely edged at ah
5886 Leaves supradecompound, Leaflets oblong terminal obovate, Petals entire
5887 Leaves supradecompound, Leaflets all linear, Petals entire
5888 Leaves supradecompound oblong, Terminal leaflet cbovate, Petals tonthed
5889 Leaves supradecompound, Lobes oblong cuneate nearly equal, Bractes very small ovate, Petals ciliate
5890 Leaves pinnate, Leaves lanceolate attenuate at base serrate crenate, Petals entire
5891 Leaves mostly ternate lanceolate pubescent: lateral very short, Cal. and ovaries villous
5899 Leaves simple lanceolate smooth, Filaments ciliated, Stem simple herbaceous
5893 Leaves in middle ternate linear narrowed at the base entire, Calyxes villous
5894 Leaves pinnatifid, Segments oblong somewhat stalked: the terminal very large, Petals ciliated
5895 Leaves bipinnate with obovate retuse leaflets, Flowers 4-petalous 8-androus
5896 The only species

\section*{5897 The only species}

5898 Leaves ovate-lanceolate acuminate serrated at end, Cal. as long as cor. Berries uvate 5899 Leaves lanceolate entire very obtuse at end, Branches of panicle short angular

5900 Flowers hermaphrodite, Leaves pinnate with an odd one, Leaflets opposite sessile, Stalk jointed winged 5901 Flowers monocious, Leaves abruptly pinnated, Leaffets alternate stalked, Stalk naked

> and Miscellaneous Particulars.
and not to be crowded amongst other plants. Cuttings strike root freely in sand, under a bell-glass. (Bot. Cult. 173.)
1000. Codon. From x \(x \delta \omega \nu\), a bell. The corolla of this plant is globular, and formed like a bell in its upper part. A scarce Cape shrub, of which 'Thunberg speaks in terms of great delight upon finding a solitary individual growing by the side of a precipice in its native country.
1001. Gomphia. From roupos, a club; but the application is not obvinus. These are most beautiful tropical bushes, with long spikes of brilliant yellow flowers, and neat serrated shining entire leaves.
1002. Quassia. So named by Linnæus, in memory of Quass1, a negro slave of Surinam, who found and discovered to Rolander, a Swede, the wood of Q. excelsa, which he had employed with success as a secret remedy in the malignant endemic fevers of Surinam.
Q. amara is a lofty tree with strong branches, white light wood, their bark and leaves not unlike those of the common ash. The flowers are in terminal racemes, of a bright red. The root, wood, bark, and indeed all the parts of this tree are intensely bitter. Linnæus says that the wood of the root is a noble remedy, but that the wood of the small branches, which has since been substituted for it, is good for nothing. The wood of both is now thought to be less intensely bitter than the bark, which is at present regarded as the most powerful medicine. Quassia has no sensible odor; its taste is that of a pure bitter, more intense and durable than that of almost any other known substance : it imparts its virtues more completely to watery than spirituous menstrua, and its infusions are not blackened by the addition of martial vitriol. It is sand that considerable quantities of this drug are used by the brewers instead of hops.
Q. Simaruba, or mountain damson, as it is called in Jamaica, is a tall tree with alternate branches, and a smooth grey bark, maculated with yellow spots. The leaves are pinnate; the flowers are male and female on the same axillary panicles, yellowish white; the fruit consists of five smooth, ovate, black, one-celled berries, on a common receptacle, and open spontaneously when ripe.

The officinal part of this tree is the bark of the root; it is inodorous, and has a bitter, but not disagreeable taste. The pieces are of a very fibrous texture, rough, scaly, warty, and of a full yellow color in the inside when fresh. Alcohol and water take up all its active matters by simple maceration, at a temperature of sixty degrees of Fahrenheit better than at a boiling heat; it is tonic, and has been employed with advantage in intermittent fever, obstinate diarrhœa, dysentery, and dyspeptic affections. (Thomson's London Dispensatory, 462.)

The different species of quassia flower freely in the stove; are of easy culture in loam and peat, and are increased by ripened cuttings taken off at a joint, and not deprived of their leaves, and planted in a pot of sand under a band-glass.

Hislory，Use，Propagation，Culture，
1003．Limonia．The general denomination of the citron in Arabia is lymol̀ \(n\) ，whence limon and lemon， to which fruits this genus is nearly related．L．monophylla is a small thorny tree，with a berry the size of a small nutmeg，very like a lime，and called by the Hindoos wild lime．Ripened cuttings of the species root in sand，under a hand－glass plunged in a moist heat．
1004．Glycosmis．From \(\gamma \lambda u x \nu s\) ，sweet，and ooun，smell；all the parts of the plant，leaves，flowers，fruit，having an agreeable perfume．G．pentaphylla is an elegant fragrant shrub，very common in most uncultivated lands in Coromandel，but chiefly under large trees，where birds have dropped the seeds．It flowers all the year there．The whole plant，when drying in the shade，diffuses a pleasant permanent scent；the flowers are ex－ quisitely fragrant；birds eat the berries greedily．

G．arborea has also very fragrant flowers．
G．citrifolia is a beautiful stove plant，not，indeed，remarkable for the shewiness of its flowers，but most valuable on account of its fruit，which is about the size of a hazel nut，very juicy and sweet，and produced in profusion in our stoves．
1005．Murraya．So named by Koenig，in honor of John Andrew Murray，knight of the Swedish order of Vasa，professor of medicine and botany at Gottingen，and an editor of Linnæus＇s Systema Vegetabilium．The species are trees of the smallest size，with dotted pinnated leaves and tragrant white flowers，quite like those of an orange．

1006．Cookia．Named by Sonnerat in honor of our celebrated Captain Cook．The fruit is much esteemed in China，where it arrives at the size of a pigeon＇s egg，growing in bunches，and it is called Wampee．It grows well in light loam，and ripened cuttings with their leaves on root in sand in a moist heat．
1007．Gartncra．In memory of Joseph Gærtner，M．D．F．R．S．Acad．Imp．Petrop．Memb，author of a most excellent work on the fruits and seeds of plants，Stutg．1788．It is a large climbing woody shrub， cultivated all over the coast of Coromandel，on account of the beauty and fragrance of its flowers．In the stove it requires a good deal of room to flower freely．It is easily increased in sand under a hand－glass．The genus is now referred to the natural order of Malpighiaceæ，among which it is remarkable for its white flowers．

1008．Monotropa．From covos，one，and resz \(\omega\) ，to turn ：its flowers are all turned one way．It is parasitical and without leaves，of a pale uniform hue，having a simple scaly stem ；allied in habit to Orobanche，to some of the Orchis tribe in its peculiarity of scent，which is like that of primrose，or beans in blossoin．The root is fibrous，much branched，and somewhat crecping，growing among dead leaves or in half decaying vegetable mould．Sir J．E．Smith says，he could never find it truly parasitical．In Sweden，Linnæus informs us，it is given dry to sheep affected with a cough．

Its natural affinity，which is certainly to the heath，Pyrola，and similar plants，is very singular and unex－ pected．

5902 Leaves sumple, Spines solitary
5903 Leaves pinnate, Leafiets oblong lanceolate crenulate, Spines solitary
5904 Leaves simple and 3-leaved, Leaflets ovate-oblong acuminate, Peduncles axillary shorter than stalk
5905 Leaves pinnate in 2 pairs, Leaflets elliptical entire
6906 Leaves pinnate in 2 pairs, Leaflets oblong obsoletely serrate

5907 Leaflets ovate, Peduncles many-fl. corymbose
5908 Leaflets ovate-acuminate, Pedunc. axill. and solitary
5909 Leaves ovate-lanceolate acuminate nearly equal at base
5910 Leaves pinnated, Leaflets ovate-lanceolate

5911 Large cernuous, Scales close together
5912 Flowers smooth lateral octandrous

\section*{5913 The only species}

5914 The only species
5915 Leaves ovate-elliptical ternate and scattered, Corymbs terminal
5916 Leaves oblong, Corymbs axillary, Bractes linear-lanceolate, Pedunc. and calyx downy with glands
5917 Leaves opposite oblong polished beneath glaucous revolute at edge, Branches 2edged
\(\beta\) Leaves linear more revolute green beneath
5918 Leaves alternate and opposite ovate-lanceolate and branches hairy, Pedunc. axill. I-flowered

and Miscellaneous Particulars.
1009. Dioncea. One of the names of Venus. It is a singular plant in respect of its leaves, which are of an anomalous form, and have a singular motion by which they catch insects, whence the specific name, muscipula, a ty-trap. The root is scaly, almost like a bulb, and not prolific in fibres. The leaves have the petiole winged as in the orange; the extreme part, or proper leaf, is the part that operates as a trap. Linnæus affirms, that when the entrapped insect ceases to struggle and is quiet, the leaf opens and permits it to escape. This does not agree with Ellis's account, for he affirms that the lobes never open again, solong as the animal continues there. He thinks it probable, that a sweet liquor discharged by the red glands tempts the insect to its destruction. He adds, that if a straw or a pin be introduced between the lobes, they will grasp it as fast as if it were an insect. The flowers grow in a corymb resembling an umbel. It is rather difficult to preserve Sweet finds it "thrive best when planted in a pot of Sphagnum with a little mould at the bottom of the pot, and placed in a pan of water." Shepherd, of the Liverpool botanic garden, finds that leaves of Dionza so placed will root and form new plants. In all cases it is necessary that an abundance of fresh cool air should be supplied to the plants.
1010. Garuga. Garugo is the Telinga name of the plant, which is rare in our stoves, although not of recent introduction.
1011. Kalmia So named by Linnæus in honor of Peter Kalm, professor at Abo in Sweden, author of Travels in America. The species are beautiful peat earth shrubs, deserving a place in every American ground. K. latifolia is a native of Carolina and other parts of North America, of Pennsylvania, New York, \&c. but only in particular places; on rocks, hanging over rivulets, and on the sides of barren hills on the most sterile soil. The noxious qualities of this elegant shrub lessen that esteem which its beauty claims; for though deer feed on its green leaves with impunity, yet when cattle and sheep, by severe winters deprived of better feed, eat the leaves, many die annually. It blossoms in May, and continues in flower a great part of the summer. (Catesby.) The fiesh of the American partridge is said to be poisonous in the winter from its feeding upon the buds of this plant. But Wilson denies this statement. The Indians use a decoction of the leaves for purposes of self-destruction. A few drops of the tincture poured upon the body of a large and vigorous rattle-snake, killed the reptile in a short time. An ointment made of the powdered leaves has been used with much success in tænia capitis, and some other cutaneous affections. (See Bigelow's Medical Botany.)

The wood, being very hard, is very useful in smaller works. The Indians are said to make small dishes, spoons, and other domestic utensils out of the roots: these are large, of a soft texture, and easily wrought when green; but when dry become hard and smooth. (Curtis.)
K. angustifolia is also reputed poisonous to sheep and cattle,

History, Use, Propagation, Culture,
1012. Ledum. Andoy was the name applied by the ancients to the plant producing the substance called Ladanum, and now known by the name of Cistus Ledum. In foliage the Ledum of modern botanists agrees with the plant of the ancients. Pretty American plants, very commenly cultivated for the beauty of their fiowers.
1013. Rhodora. A name of the same meaning as Rhododendron. It is well known in shrubberies as remark. able for its purple flowers appearing on the naked shoots before the leaves come out.
1014. Rhododendron. From podov, a rose, and \(\delta \in \nu \delta \rho o v\), a tree, because the flowers resemble in color bunches ground; and all of them are interesting and dil and even splendid ornaments to the shrubbery or American R. ferrugineum and hirsutum interesting and deserving of culture.
R. ferrugineum and hirsutum abound on the high mountains of Switzerland, Austria, Savoy, Piedmont, Dauphiné, and terminate ligneous vegetation as we ascend, and furnish the shepherds with their only fuel. The grouse are said to eat them; and the white hares sometimes gnaw the bark in hard weather; but animas do not seem to feed on them, except from want of other food; and they are suspected of being in a small dree poisonous, The galls of some small insect are frequent on them.
R. dauricum is almost peculiar to the subalpine tracts of eastern Asia; it appears first at the mouth of the river Jenisea, and beyond that, especially from the river Uda, in the pine woods, it begins to be common; but Lena Baikal it is most abundant, and extends through the deserts of the Mongols to China and Tibet : at the (Pallas.)
R. Camtschaticum is an elegant evergreen under shrub; it grows abundantly in the peninsula of Kamtchatka and Behring's island in muddy places on the mountains.
\(R\). caucasicum is a native of the higher rocks of Caucasus, near the perpetual ice, in the highest range of shrubby vegetation, with Myrtillus and Vitis idæa.
\(\mathbf{R}\). chrysanthum is a beautiful evergreen, resembling \(\mathbf{R}\). dauricum, and like it is a native of the alpine regions of Siberia, where it is a noted remedy for rheumatism, It is cultivated in this country with the

and Miscellaneous Particulars.
greatest difficulty. The leaves have an austere, astringent, bitterish tavte, and are stimulant, narcotic, and diaphoretic. When taken, they first increase the arterial action and the heat of the body, produciug diaphoresis; and these effects, according to Dr. Home's observations, are followed by a proportional diminution of excitement, the pulse in one case having been reduced thirty-eight beats. It has not been much used in this country. (Thomson's London Dispensatory, 477.)
\(\mathbf{R}\). maximum grows on rocks and in barren soils, where it continues flowering great part of the year, and is very omamental.
R. ponticum grows in wet places in beech and alder coppices, on rocky mountains, but not on high alps.

Rhododendrons are commonly propagated by layers, but some sorts produce seeds, and seeds of others are obtained from America. The seeds "should be sown early in spring, in flat pans or pots of peat soil, and very thinly covered: they may then be set in a close frame, or at the front of a hothouse, till they come up, watering them slightly when dry; as soon as they are high enough to be laid hold of, they must be pricked out in other pots, which should be placed in a shady situation; they may stand in a frame a few days till they have taken fresh root, but they must not remain long, or it will spoil them. The small kinds may be propagated freely by cuttings, taken off" in the young wood, and planted in sand, under a bell-glass." (Bot. Cult. 815.)
1015. Epigaa. From \(\varepsilon \pi \gamma\), upon, and \(\gamma \eta\), the earth. The stem grows flat upon the ground, and throws out roots all the length of its branches. A very pretty little American plant with delicate white flowers.
1016. Andromeda. Named in allusion to the virgin Andromeda, who, like this plant, was confined in a marsh, and surrounded by monsters of the waters. For an ingenious explanation of this application, see Linnæus's Flora Lapponica. The species are neat little plants, and some of them considerable shrubs and trees. They all require peat earth, and a moist situation; for those of them which do not grow naturally in bogs are mostly inhabitants of alpine regions, where the air is always more moist than on plains.
A. hypnoides has the appearance of a moss, spreads over great tracts of ground in the Lapland alps, and adorns them with its beautiful red flowers. The Andromeda is generally increased by layers, but may be also raised from seeds. "These must be very thinly covered, as they are small, and would rot if covered deep:

History, Use, Propagation, Culture,
when about an inch high they should be planted out thinly in other pots, where they will grow strong, and, when large enough, may be planted in the open ground. Spring is the best time to plant them out, as the frost and worms are apt to throw them out of the ground in winter, if planted out in autumn. (Bot. Cult. 278.)
1017. Enkianthus. From eqzvos, a pregnant woman, a name given to the plant by Loureiro, because the great colored buds appear as if pregnant with the flowers which afterwards appear. This beautiful genus, as Sweet observes, has generally been considered difficult to propagate: the difficulty is now removed, as ripened cuttings root readily planted in pots of sand, and placed under a hand-glass, without bottom heat. The best soil for it is an equal mixture of sandy loam and peat, and oare must be taken not to overwater it when not in a growing state : when it gets pretty large it is one of the most ornamental plants for the greenhouse or conservatory. (Bot. Cult. 186.) There are several species confounded under the common name Enkianthus quinqueflora.
1018. Gaultheria. Named after one Gaulthier, a French physician at Quebec. A small evergreen plant, cultivated in the American border for the sake of its ornamental bright scarlet berries. The species may be increased by dividing at the root, by suckers, layers, or from seeds.
1019. Arbutus. An ancient name of this plant, said to be traceable to the Celtic ar boise, austere bush, in allusion to the roughness of the fruit. In like manner Unedo is said by Pliny to have been so called from unum edo, I eat one, because, being found disagreeable, no one could eat a second. L'Arbousier, Fr., Landbeere,

5944 Pedunc. aggregate, Cor. ovate, Leaves alternate lanceolate revolute
\(\propto\) Leaves oblong
\(\beta\) Leaves lanceolate
\(\gamma\) Leaves linear-lanceolate
ס Leaves subulate
5945 Racemes 1-sided panicled terminal, Leaves lanceolate obovate acute serrulate at end
5946 Racemes terminal panicled, Cor. roundish, Leaves ovate entire
5947 Raceme compound, Leaves lanceolate subserrulate hairy shining
5948 Spikes terminal 1-sided, Leaves membranous smooth oval-lanceolate serrulate acute
5949 Raceme compound terminal crowded, Leaves narrow lanceolate rough at edge pilose beneath
5950 Leaves lanceolate wavy beneath rusty scaly, Cor. campan, finally of 5 petals, Anthers awned
5951 Hispid with pubescence, Leaves obov. lanc. acute serrul. Cor. globose hispid, Anthers awned
5952 Panicles terminal, Cor. pubescent, Leaves elliptical acuminate toothletted
5953 Racemes term, simple bracted, Cor. cylindrical, Leaves obl-lanceolate serrated
5954 Racemes terminal and axillary 1 -sided, Cor. ventricose tubular, Leaves oblong lanc. finely serrated
5955 Racemes axillary simple, Cor, oblong, Leaves ovate acute serrulate
5956 Racemes axillary simple, Leaves ovate entire shining, Branchlets 3-cornered

5957 Racemes axillary simple, Leaves ovate lanceolate acuminate serrate

5958 Quite smooth, Leaves obl. ovate acute finely serrulate, Racemes axillary and terminal clustered 5959 Peduncles solitary axillary 1-sided Bractes 2, Leaves oval scaly dotted obsoletely serrated \(\propto\) Cor. ventricose, Leaves obl. lanceolate
\(\beta\) Cor. obl. cylindrical, Leaves oblong oval obtuse
\(\gamma\) Very dwarf
5960 Pedunc, solitary axillary, Bractes 2, Leaves narrow oblong lanceolate, Corolla oblong oval

\section*{5961 The only species}

5962 Leaves oblong obovate mucronate toothed crowded, Stem procumbent
5963 Stem arborescent, Leaves oblong lanceolate, Panicles smooth nodding, Berries many-seeded

5964 Leaves oblong-lanceolate serrated, Panicles vertical hispid glutinous
5965 Stem arborescent, Leaves ovate entire or serrated, Pan. pubescent erect, Berries many-seeded 5966 Stems procumbent, Leaves rugose serrated
5967 Stems procumbent, Leaves entire
5968 Stem much branched, Leaves lanceolate acuminate acutely serrate, Flowers axillary
5469 Bark deciduous, Ovary smooth. The same as next ?
5970 Leaves lanceolate serrated very thin a little wavy

and Miscellaneous Particulars.
Ger., and Arbuto, Ital. This genus includes one of the most elegant of hardy shrubs, the A. unedo. This evergreen is peculiarly beautiful in October and November, covered at once with blossoms and ripe fruits. It is a native of the south of Europe, and is found also near Killarney in Ireland, where it has probably been brought from Spain or Italy at an early period by the priests. It grows there on limestone rocks, in greater luxuriance than it is often to be met with in the woods of Italy: in both countries the fruit is eaten; and in Spain both a sugar and spirit is extracted from it.
A. uva ursi, La Busserole, Fr., Barrenbeere, Ger., and Uva d'orzo, Ital., is abundant in many parts of the continent, especially the alpine regions. It dyes an ash color; tans leather; the berries are food for grouse and other game, and the leaves are used in medicine. The fresh leaves are inodorous, and have a slightly bitter astringent taste, leaving a sweet sensation in the mouth. When properly dried and powdered, they acquire an odour similar to that of hyson tea; but the taste remains the same, the degree of bitterness only being increased. (Thomson's London Dispensatory, 163.)

It is used sometimes in calculous complaints and ulcerations of the urinary organs,
The dwarf species of this genus and those of Rhododendron and Andromeda, are very fit plants for rock work. A. alpina thrives best in peat kept moist and shaded. All the species may be increased by seeds, or by budding and inarching on each other: the dwarf kinds root readily by layers.

The Uva ursi has been brought into notice in modern times as an efficient remedy in nephritic and even in calculous cases. European practitioners have doubted its powers, but it has found many supporters of respec-

History，Use，Propagation，Culture，
tability in North America．The late professor Barton found the plant of much service in his own case or nephritic paroxysms alternating with gout in the feet．It has also been recommended as a remedy in pulmonary complaints．（See Bigelow＇s Med，Botany．）
1020．Clethra．K \(\lambda\) n \(\boldsymbol{q} \rho \infty\) was the name given by the Greeks to the Alder，to which，in its leaves，this bears some resemblance．Pretty upright North American plants，with white flowers．One species is a native of Madeira．

1021．Mylocaryum．From \(\mu v \lambda n\) ，a mill，and zogva，a kernel or stone；the four wings of the nut may be easily likened to the four sails of a small mill．A North American plant，with the habit of Andromeda，or rather of Clethra．
1022．Pyrola．A diminution of Pyrus，to which，in the leaves，this is thought to be similar．A genus of elegant little plants，mostly evergreens．They grow naturally in the shade，and in rocky or very poor soils；in the garden on sand or gravel shaded；and they are increased by seeds or young cuttings，planted under a hand－ glass．All the species are powerfully astringent and tonic，and one or more of the American sorts is said to constitute the chief ingredient in the scorbutic draughts of Whitlaw．

P．uniflora，Sir J．E．Smith says is one of the most curious and elegant of British flowers．
1023．Chimaphila．From \(x \varepsilon \mu \kappa\) ，winter，and \(\operatorname{cis}^{2} \varepsilon \omega\) ，to love；a sort of translation of the English name winter－green．The species may be treated as Pyrola，which they much resemble．
1024．Inocarpus．From is syos，fibre，and soegros，fruit．The envelope of the nut is composed of tough interwoven fibres．It is a lofty tree，with alternate subcordate leaves，and fowers in racemes succeeded by by nuts called Ratta in Otaheite．The kernel of these，which is kidney－shaped，and about an inch in diameter，is eaten roasted by the inhabitants of the Society and Friendly Isles，the New Hebrides，New Guinea，the Molucca isles，\＆c．It is sweetish，but less pleasant than the chesnut，harder and less farinaceous． The bark is astringent，and is used in the dysentery．In New Guinea they smear the heads of their arrows with the expressed resinous juice．（Forst．Escul．）

1025．Styrax．A name altered by the Latins from the Arabic assthirak．Pliny says，that the Arabs in his time used the resin to flavor the perfumes of which they are so fond．S．officinale is a low tree with slender branches，ovate leaves，llowers in racemes from the sides of the branches，succeeded by ovate globular juice． less drupes，containing one or two angular nuts．From this tree storax is obtained in Asiatic Turkey．It issues from incisions made in the bark；and as it was formerly the custom to collect and export it in reeds，it was named Styrax calamita．It has a fragrant odour，and a pleasant subacidulous，slightly pungent，and

\section*{DIGYNIA.}

History, Use, Propagation, Culture,
1028. Quisqualis. A Latin word, expressive of uncertainty. It was given by Rumphius to a tree of Amboyna, because it was subject to variation. It is a fine climbing genus of easy culture. The best soil for the species is a mixture of loam and peat; and cuttings root freely in sand, under a hand-glass. (Bot. Cult. 100.)
1029. Melastoma. From \(\mu s \lambda^{2}\), black, and soua, mouth. Many of the species produce black berries similar to gooseberries, and which stain the mouth black. This is a very numerous genus of shrubs and low trees; the species display great unity of character, and may be considered ornamental. They require but little water in winter, and are easily increased in sand, plunged in a moist heat.
1030. Petaloma, From \(\pi \in \tau \propto \lambda o v\), a petal, and \(\lambda \omega \mu \alpha\), an edge. Flowers of which the petals are inserted on the edge of the calyx. A small plant with the leaves, but not flowers, of Melastoma.
1031. Acisanthera. From \(\alpha x \downarrow\), a point, the anthers being pointed, Plants with the habit of Melastoma.

5997 Leaves ovate
5998 Leaves subcordate pubescent
5999 Leaves ovate-lanc. entire 3-nerved rough, Fl. terminal subcorymbose
6000 Leaves 3 -nerved entire sessile ovate acute villous silky, Racemes brachiate, Stems square
6001 Leaves 3 -nerved without a marginal one entire smooth on each side thin, Racemes term. Fls, sessiie
6002 Leaves entire 3-nerved ovate-lanc. smooth, Margin and nerves hispid beneath, Fl. terminal
6003 Leaves entire 3-nerved oblong emarginate at base, Raceme erect term. Fl. tetrandrous
6004 Leaves toothletted 5-nerved ovate-lanceolate, Stem hispid
6005 Leaves ovate acuminate toothletted 5 -nerved, Cymes axillary
6006 Leaves cordate acumin. 5-nerved serrulate pubescent, Cymes terminal, Sepals roundish, Stamens 5 sterile
6007 Leaves cordate subcrenate beneath rusty with down, Flowers axillary and lateral solitary sessile
6008 Leaves ovate lanceolate acuminate 5 -nerved pilose somewhat toothletted, Branches bifid, Panic. term.
6009 Leaves entire 5-nerved subcordate scabrous, Cor. little hairy outside
6010 Leaves entire 5-nerved lanceolate ovate rough
6011 Leaves 7 -nerved ovate subcordate acuminate ciliated with teeth, Corymb terminal, Flowers 1-sided
6012 Leaves 3-nerved without ribs ovate-lanceol. acuminate toothletted, Corymbs term. trichotomous powdery
6013 Leaves 5 -nerved obl. lanceol. acute entire hoary beneath, Pedunc. umbelled, Bractes double
6014 Leaves 5 -nerved entire ovate acute smooth above beneath hoary, Flowers clustered sessile
6015 Leaves entire 5 -nerved ovate-oblong smoothish acuminate smooth at edge
6016 Leaves 5-nerved nearly entire oblong acuminate smooth beneath yellowish, Racemes cymose
6017 Leaves lanceolate ciliated 3-nerved obtuse at base, Stems square, Flowers terminal solitary
6018 Leaves cordate oval entire stalked beneath woolly, Petals obcordate, Petals bowed at base
6019 Branches winged, Leaves oval-lanceol. with a long point, Petals obovate pointed, Filam. woolly above
6020 Leaves oblong elliptical 3-nerved ciliated, Calyx setose at end
f021 Stamens 12, Leaves ovate-lanceolate 5 -nerved, Stems and globose ovaries very hispid

\section*{6022 Peduncles solitary 1-flowered}

6037 Leaves obovate villous coriaceous, F1, stalked polyandrous polygynous
6038 Leaves elliptical, Flowers polyandrous polygynous

and Miscellaneous Particulars.
1032. Dass. A name of unknown application. The plant resembles in its leaves the Rhus cotinus, whence its specific name. It may be increased by cuttings of the roots placed in a warm situation.
1033. Bucida. From \(\beta_{\text {Bs }}\), an ox. The form of the fruit when ripe resembles the horn of such an animal. This tree grows in Jamaica in low swampy lands near the coast; it is remarkable for its slender crooked branches, and the tufted disposition of the leaves: it grows to a considerable size, is reckened an excellent timber tree, and the bark is greatly esteemed by the tanners.

Well ripened cuttings root in sand, plunged in heat, and covered.
1034. Samyda. Eapuסa is the Greek name of the birch, to which this genus may be likened in its leaves. The species are rather tardy in growth, but not difficult to root in sand under a hand-glass.
1035. Royena. So named by Limuæus, in honor of Adrian Van Royen, who with his son David wera successively professors of botany at Leyden. It consists of shrubs of little beauty, which are increased by ripened cuttings in sand under a hand glass. They are chiefly natives of the Cape of Good Hope.

History，Use，Propagation，Culture，
1036．Trianthema．From \(\tau \xi \leqslant 5\) ，three，and avios，flower；the flowers growing by threes in the axilla of the leaves．The species are weeds in their native countries，and of little interest here．
1037．Scleranthus．From \(\sigma \approx \lambda \eta \rho o s\), hard，and \(\alpha y 9 \circ 5\) ，a flower；when in seed the envelopes of the flower appear very much indurated．S．annuus is common throughout Europe and Siberia on a sandy soil．It flowers about the middle of summer，and sows its seeds very abundantly in autumn，which produce a crop of young plants that generally survive the winter，or，if destroyed，are replaced by another crop arising from those seeds that happen not to vegetate till spring．（Eng．Bot．）The Swedes and Germans receive the vapour arising from a decoction of it into their mouths，to cure the tooth－ache．（Withering．）

S．perennis in several parts of Europe has its roots attacked by the insect Coccus Polonicus，Lin．which yields a fine crimson dye，and is said likewise to live on S．annuus and some Potentillæ．Sir J．Smith has＂never been able to find this insect on these plants in England．＂（Flora Brit．ii．283．）
These two species are occasionally found in abundance upon barren heathy wastes．
1038．Cunonia．In memory of John Christian Cuno，of Amsterdam，who described his own garden in Dutch verse in 1750．This is a handsome tree，with fine shining green foliage，contrasted by numerous dense elongated branches of small milk－white flowers，and twigs of a red color：having the habit of a tropical rather than of a Cape plant．Its colonial name is Rood Elxe（red alder），although the tree has not in any point of view the least resemblance to the alder of Europe．
1039．Hydrangea．From i \(\delta \omega \rho\) ，water，and arveioy，a vessel．The common garden species，H．hortensis，is quite a marsh plant，and to be managed well should have a very copious supply of water in summer．A large plant will consume ten or twelve gallons daily，in warm weather．

H．quercifolia is an elegant plant when in leaf；but as it is barely within the limits of ligneous plants，it dies down to the ground on the approach of frost．H．hortensis is much valued on account of the great profusion of its very elegant flowers，which are monstrous in the same manner as the Viburnum opulus．It has never

6070 Leaves cuneate obovate somewhat toothed shorter than stalk, Stem panicled
6071 Leaves roundish cuneate crenate in front, Stem naked simple, Flowers clustered racemose

and Miscellaneous Particulars.
been found in a wild state, but is extensively cultivated in the gardens of China and Japan, from whence it was introduced to Kew by Sir Joseph Banks. The fowers are almost always barren ; they are naturally of a rose color, but under certain circumstances of culture they become blue. The yellow loam of Hampstead Heath and some other places, and some sorts of peat earth are found to produce this effect; but the cause is not yet ascertained. Dr. Daalen, of Antwerp, finds that turf-ashes, and, still more effectually, those of the Norway spruce, the wood generally used as fuel by him, applied to the roots of Hydrangea, produced the blue color of the petals. (Neil's Hort. Journ. 122.) According to Busch, of Petersburgh, "the hydrangea will be turned blue by watering the young plant, the summer before, "with alum water. Our grey colored earth, under the black moor-earth, has the same effect, being combined with aluminous salt." (Hort. Trans. vol, iv, 568.) Sweet recommends a bed of peat, and says, the longer it remains there the bluer will be the Howers.
The hydrangea, to flower freely, must not be allowed more than three or four strong shoots from the same root; it must have abundance of pot room, and plenty of water when in flower. It is a good plan to shift the plants twice or oftener during the early part of the season. If plunged and turned out of the pot into an open border in the end of May, they will flower vigorously, and will even stand the winter around and south of London, and flower yearly, and if well protected in winter very freely and strongly. The flowers are produced from the extremities of the shoots of the current year.
1040. Chrysosplenium. From \(\chi \rho^{2} v a s\), gold, and \(\sigma \pi \lambda n y\), the spleen; a figurative name applied to this plant, with reference to its medicinal qualities. It is said to be a powerful cathartic. In the Vosges the plants are used copiously as a salad, under the name of Cresson de Roche.
1041. Saxifraga. Saxum-frango, to break the stone; a name contrived in reference to supposed medicinal qualities which are now forgotten.

An elegant genus of alpine plants, which have long been favorites in gardens, Many of the species are

History, Use, Propagation, Culture,
quite easy to cultivate, and although naturally mountaineers, not incapable of breathing the more impure air of towns and vallies. The greater part known are delicate and difficult to rear: they are regardless of cold, but suffer from mild and humid weather during the winter months. Most of the species are perennial, with either fibrous or granular roots, and a few are annual. Of the latter one species, S. tridactylites, is common upon very old walls in England, flowering in the beginning of the spring. The parts of fructification are extremely variable in this genus, and have given rise to the construction of many supposed genera, the constituents of which have the recommendation of agreeing with one another pretty well in habit. The limits, however, of these genera are too obscure, and the gradations by which they are united so obvious, that they have not yet been adopted by men of science generally. Without interfering with that question, the old mode of considering Saxifrage has been here adhered to, as being the most popular and the best under-

6072 Leaves obovate crenate subsessile, Stem naked, Flowers headed
6073 Leaves serrate, Stem naked branched, Petals acuminate
6074 Leaves lanc. mucronate with a cartilaginous ciliated edge, Stern naked few-fl. Cal, olutuse
6075 Leaves linear perforated dotted aggregate recurved, Stem many-fl.
6076 Leaves lanc. obtuse hairy, Stem naked 2 -flowered
6077 Leaves ovate opposite imbricated: the upper ciliated
6078 Cauline leaves lanc. alternate ciliated, Stems procumbent
6079 Cauline leaves lanc. alternate naked unarmed, Stem erect
6080 Cauline leaves lin. subul. scattered naked unarmed, Stem decumbent
6081 Cauline leaves linear alternate ciliated: radical aggregate
6082 Cauline leaves reniform toothed stalked, Stem panicled
6083 Cauline leaves reniform lobed, Stem branched, Root granular
6084 Cauline leaves palmate stalked, Stem very simple 1-fl. bulbiferous
6085 Cauline leaves palmate : the upper floral ovate, Stem simple about 2 -flowered
6086 Cauline leaves ovate lobed, Stem filiform weak
6087 Leaves cuneiform 3-parted with trifid linear segments, Stem simple ascending, Petals lanceolate
6088 Radical leaves reniform 5-lobed many-cleft, Cauline linear, Stem nearly naked branched
6089 Rad. lvs, reniform pedatifid 7-lobed, Caul. palmate and lin. Stem nearly naked branched, Pet. lin, obov.
6090 Smooth, Radical leaves 3-lobed, Lobes many-cut ; lateral segments falcate, Stem panicled, Cal. colored 6091 Radic. leaves palm. 5.parted, Cauline linear undivided, Stems ascending many-f
6092 Leaves hairy trifid or 5 -fid bearded, Runners procumbent, Stem leafy, Petals obovate rounded
6093 Leaves reniform palm. hairy, Stem and flower-stalks filiform
6094 Caul. leaves wedge-shaped tritid alternate, Stem erect branched
6095 Leaves wedge-shaped, Radic. entire and 3-toothed, Caulıne 5-too
6095 Leaves wedge-shaped, Radic. entire and 3-toothed, Caulsne 5-toothed; upper trifid, Pedunc. about \(\hat{S}\)-f.
6096 Leaves palmate 3-parted, Segments subtrifid, Stem branched ascending
6007 Leaves cuneiform palmate 5 -fid ciliated longer than the linear petiole, Runners very short tufted
6098 Leaves hairy 3 or 5 -parted, Lobes elliptical acute, Runners ascending, Petals obovate i-nerved
6099 Leaves hairy palmate 5 -cleft and trifid, Stem leafy panicled, Petals roundish
6100 Leaves ciliated cuneate trifid nearly 5 -cleft, Pedunc. solitary elongate 1-fl.
6101 Cauline leaves lin. entire and trifid, Runners procumbent, Stem erect nearly naked
6102 Radic. leaves aggregate entire and trifid acute linear, Stem viscid nearly racemose, Petals length of cal
6103 Radic. leaves aggregate membranous lin. lanceolate entire or trifid, Stem nearly naked about 2 -fl.
6104 Radic, leaves aggr. linear ohtuse trifid cut, Stem erect many-fl. Petals twice as long as cal.
6105 Leaves imbric. cuneate-palmate ciliated, Petals round, Styles spreading, Stigmas fat woolly
\(6100^{\circ}\) Radical lzaves aggregate entire and trifid oblong obtuse, Stem filiform about 2 fl , Pet as long as calyx
6107 Leaves cordate acutely lobed toothed, Scape racemose
6108 Leaves ovate cordate acute shortly lobed toothed, Raceme filiform spiked
6109 Leaves biternate

6110 Leaves cordate about 3-lobed toothed, Scape 2leaved
6111 Leaves orbiculate reniform doubly crenate lucid, Scape setaceous lucid
6112 Ieaves reniform repand ciliated, Scape naked
1. Calyxes not scaly.

6113 Flowers clustered, Stems simple roughish, Leaves linear fleshy
6114 Flowers corymbose, Stem ascending, Leaves lanc. lin. obsoletely 3-comered obt. 1-sided, Stam. exserted 6115 Flowers corymbose, Petals rarely subemarginate, Leaves linear fieshy smooth flat
6116 Flowers corymbose, Branches divaricating, Leaves ovate lanc. smooth at the base cordate amplexicaul. 6117 Branches spreading, Flowers panicled small, Pan. much branched, FI.-stalks viscid
6118 Flowers panicled, Panic. much branched polished, Leaves ovate lanc. half stem-clasping
6119 Fl, trichotomous panicled, Pedunc. villous viscid, Petals emarginate twice as long as calyx
6120 Fl. panicled very minute diœcious, Peduncles smooth filiform divaricating, Leaves lin. lanc. rough
6121 Fl. panicled, Panic. divaricating, Branches few-flowered pubescent viscid, Leaves lin. lanc. obtuse 6122 FL. dichotomous, Panic. smooth, Pet. emarg, twice as long as cal. Leaves lanceolate fleshy

and Miscellaneous Particulars.
those who profess to be best acquainted variation in appearance, and to much diversity of opinion among doubtful kinds have been omitted, and those which are middle course has here been taken, by which the admitted.
1042. Tiarella. From tiara, a particular kind of head-dress, Pretty little North American herbaceous plants, related to saxifrage, and easily to the form of its capsule. sandy peat and loam.
1043. Mitclla. A diminutive of mitra, a mitre; so named for the same reason ag the last genus, which it
lu44. Gypsophila. From ru母os, chalk, and \(\phi \Delta \lambda \omega\), to love; most of the species delight in chalky districts.

History, Use, Propagation, Culture,
Some of the species are fine border plants, but the greater part are of little beauty, and only grown in botanic gardens.
1045. Saponaria. In allusion to its mucilaginous sap, which is said to be fit for supplying the place of soap, sapo. S. officinalis plena is considered a border flower, but is inconvenient unless kept in pots, from its spreading very much by the roots, which are underground creepers, like those of couch. The leaves form a lather with soap, and take out spots of grease in the same manner. The whole plant is bitter, and was formerly used to cure the itch and the venereal disease.
1046. Dianthus. \(\Delta 105\) ox. \(\%\) os, the fower of God, or divine flower; so nained on account of its pre-eminent beauty. Most of the species of this genus are highly valued, not only for the beauty of their flowers, but also as being evergreens; their foliage during winter being as abundant and vivid as in summer. The fragrance of some of the species is peculiarly grateful, and no plant in this respect surpasses the carnation. D. barbatus is an old inhabitant of the flower garden, and was much esteemed in Gerarde's time "for its beauty to deck up the bosoms of the beautiful, and garlands and crowns for pleasure." The varieties are numerous, but as the plant has never been treated by florists as a leading flower, they have not been named or improved. A hybrid variety called the Mule, or Fairchild's Sweet-William, is supposed to have been produced from seeds of the

and Miscellancous Particulars.
carnation impregnated by a Sweet-William. D. caryophyllus is considered the source whence have sprung the numerous varieties of the carnation, and some think those also of the pink. The pink, however, is more probably derived from some of the smaller growing species, as plumarius, deltoides, armeria, carthu. sianorum, \&c.

The carnation is rarely found wild in England, but it may be gathered on the south side of the Swiss Alps. It seems to have been unknown to the ancients, at least in its cultivated state, not being mentioned by Pliny, or sung by any of the Roman poets. It has, however, been cultivated from time immemorial in Europe, and is in the highest favor for its beauty and rich spicy odour. It is the principal florist's fower of Germany and Italy, from which countries the British florists procure their best carnation seed, and also some esteemed varieties.

The varieties of carnation amounted to nearly 400 named sorts in the beginning of the eighteenth century, and the number has not since diminished. They are arranged in three classes; flakes, bizarres, and picotees. Flakes have two colors only, and their stripes large, going quite through the leaves; bizarres, Fr. (odd, irregular) are variegated in irregular spots and stripes, and with no less than three colours ; picotees, Fr. (piquettée, pricked or spotted) have a white ground, spotted or pounced with scarlet, red, purple, or other colors. Of

History, Use, Propagation, Culture,
each class there are numerous varieties, arranged under the farther subdivisions of scarlet flake, pink flake, purple flake, yellow flake, \&c. ; scarlet bizarre, crimson bizarre, \&c.; and purple picotee, yellow picotee, \&c.
Picotees are rather smaller flowers than carnations, and are distinguished by the serrated margins of their petals; the colors are principally yellow and white spotted, and the plants are considered hardier than the other sorts. Whatever colors the flower may be possessed of, they should be perfectly distinct, and disposed in long regular stripes, broadest at the edge of the lamina, and gradually becoming narrower as they approach the unguis, or base of the petal, there terminating in a fine point. Each petal should have a due proportion of white, i. \(e\). one half, or nearly so, which should be perfectly clear and free from spots. Bizarres, or such as contain two colors upon a white ground, are esteemed rather preferable to flakes, which have but one, especially when their colors are remarkably rich, and very regularly distributed. Scarlet, purple, and pink are the three colors most predominant in the carnation; the two first are seldom to be met with in the same flower, but the two last are very frequently.

New varieties are procured from seeds, and thousands of seedlings are annually blown by florists and amateurs, sometimes without one being found worth keeping. Established or approved varieties are continued by layering and cuttings, or, as they are commonly called, pipings. The soil in which the carnation thrives best is a rich loam rather sandy than otherwise; the climate should be free from extremes of every kind, for which reason they are commonly grown in pots, and protected by a frame during winter, and covered by an awning while in bloom. Carnations grow exceedingly well in beds of properly prepared soil, over which frames are placed in winter, and an awning of canvass or bunting when the plants are in blossom. Those who are curious in blowing their camations have a great many nice and curious operations to perform when they come into flower. Such petals as are plain, or run from the proper colors of the variety, are extracted by a particular instrument; the remaining petals are next. arranged so as to form a convex imbricated surface; the calyx being slit down or tied up as may be necessary to aid this end. Then the flowerstalks are neatly tied to sticks, and the flower supported in a pendant attitude by means of properly formed brass wires.

6163 Stem branch, upw. closely dichotom. FL. sol. Bract. with a spread. leafy point, Lvs. lin. subul. 3-nerv. hairy 6164 Stem branched, Fl. sol. Scales very short ovate, Petals very broad beardless, Lvs. lin, sub. channelled glauc.

\section*{TRIGYNIA.}

6195 Branches divaricating, Leaves ovate, Cal. campanulate, Pet. distant

Behind the petals a circle of card paper is sometimes fixed to keep them in position, and the pot in which the plant grows is placed on a particular description of saucer, by which it is surrounded by water, in order to prevent the approach of ground insects, and especially of the earwig. These and a number of other operations will be found described at length in Maddock's Florist's Directory, and in the Encyclopædia of Gardening. (Sec. 6406.)
The pink, as a florist's flower, is of much less antiquity than the carnation : it is scarcely mentioned by Gerarde, and Parkinson has given very few varieties. It was chiefly grown as a border flower till within the last fifty years, since which it has been greatly improved and many fine varieties originated. Being one of the hardiest and least expensive of fine flowers, it is much cultivated by operative mechanics and manufacturers round large towns, and no where to such an extent as about Paisley, by the muslin weavers there.
The varieties of pink most cultivated are chiefly those called pheasant's eyes, which seem to have sprung from \(D\). plumarius. Cob pinks are a large sort seemingly intermediate between pinks and picotee carnations; red early pinks are smaller plants than cobs, but larger than pheasant's eyes, and seem to have sprung from cobs and D. armerius or deltoides. The Paisley growers reckon above three hundred varieties of the pheasant's eyes. To garden pinks in general Wildenow gives the appellation of D. hortensis.
The propagation and culture of the pink is the same as that of the carnation, excepting that it is less frequently kept in pots or frames, but planted in beds of fresh loamy soil, and the small side shoots reduced in the autumn in order to throw more strength into those intended to produce flowers the following season. Some cover their pink bed with an awning. Not more than eight or ten flowers are ever allowed to expand on one plant, and these, if they shew a tendency to bursting at the calyx, are to be tied as in carnation culture.
1047. Cucubalus. A name signifying a bad subject; an evil weed. According to Miller, the berries of this plant are no less deadly than those of Nightshade.
1048. SILE'NE. \(L\).

wood chickweed

625!

History, Use, Propagation, Culture,
being very low and prolific in flowers, it is well adapted for sowing in pots. S. Armeria is one of the annual border flowers of the sced shops.
1019. Stellaria. The parts of the flower are stellate. The species are grassy-looking plants of the easicst

6251 Smooth, Stems erect branched, Lvs, lanc, acute: lower obt. Petals not opening obcordate, Stam. usually 5 6252 Pubesc. Stem erect much branched slender, Lower lvs. obl. obt. : upper lanc. narrow, Pet. short erect bifid 6253 Nearly smooth, Stem erect branched somewhat leafy, Leaves lanc. acute ciliated, Fl. small panicled
6254 Pubescent, Stems branched, Lower leaves ellipt, spatulate: upper lanc. Fl. term. twin, Petals bifid
6255 Pubescent, Stems erect branch. straight, Low. Ivs. lanc. spat. : up. linear, Fl. loosely panicled, Pet. 2-lobed 6256 Stems branched, Leaves lin. spatulate, Fl. term. Cal. cylindr. clavate, Petals 2 -fid
6257 Smooth, Stems erect branched, Low. lvs, ov, stalked obt: : up. lin. acute, Fl. loosely panic. Cal ov. clavate 6258 Viscid pubesc. Stems erect much branch. Liss, fleshy : low. spatul. ; up. ov. Fl. small, Pet. obcord. crowned 6259 Tufted, Stems assurgent, Lvs, lin. acute, Peduncles very long, Cal. long clavate, Petals 2 parted crowned 6260 Tufted shortly bristly, Stems assurgent, Leaves lin. with bristly teeth, FI. small, Petals 2-fid crowned 6261 Smth. Stems erect or assurg. somew. branch. leafy at base, Lvs. lanc. lin. acute: low. spat. Pet. 2-part. naked
87. Caulescent, Flowers panicled, rarely solitary, Pedicels opposite short, Calyx tubular. * Flowers nodding, Calyxes cylindrical.
[reflexed
6262 Smooth viscid, Stems erect, Lvs. somewhat fleshy lin.-lanc. fringed with fine bristles, Pet. very long 2part. 6263 Pubesc. Stems leafy at base, Radical lvs. spatul. : upper lanc. lin. Pet. 2-parted reflexed with a long crown 6264 Like the last, but smooth, less branched, and less leafy, Leaves linear, Petals often green 6265 Like the last, but stems flexuose broken down, Petals white above beneath livid green 6266 Smooth, Leaves lin. lanc. ciliated at base, Fl. pan. erect, Cal, ventricose cylindr. Petals 2-parted 6267 Hairy soft, Stem branch. leafy, Lvs. large ov. acum. Fl. in large nodding panicles, Pet. with very long claws 6268 Smooth, Stems erect simple scarcely leafy, Petals 2 parted with filiform lobes

\section*{** Flowers erect, Calyxes clavate.}

6269 Velvety glutinous upwards, Stem erect branched leafy, Fl, small loosely panicled, Stamens very long 6270 Stem short about 2-flowered pubescent, Radic, leaves lanc. lin. acute, Cauline very short, Pet. bifid 6271 Scarcely pubesc. Root long creeping, Stem erect almost simple, Lvs, lin. grassy acute, Fl. few erect panic. 6272 Viscid pubesc. Stem procumb, assurgent branch. Fl, large panic. Cal, large clavate, Pet. broad bifid crowned 6273 Scarcely pubesc. Stem upright branched, Lvs. lin. lanc, Fl. panicled erect, Cal. netted, Pet. small emarginate 6274 Smoothish viscid, Stem crect, Alternate branches long, Cal. large clavate netted, Petals bifid 6275 Visc. pubes. Stems erect branch. Lvs. large, Fl. large panic. : every other stripe of cal. veiny, Teeth very long 6276 Pubes. Stems erect branch. Lvs. lanc. obt. Fl. panic. : every other stripe of cal.veiny, Pet. with broad toothl. 6277 Subtomentose, Stems branch. Lvs. obov. stalked, Fi term.erect, Pet. obcord. 2-toothed at base [lobes 6278 Silky, Stems branched, Lvs, with a long fringe at base, Fl. large term. Pet. 2-parted crowned f279 Stems much branch. scarcely pubesc. Lower lvs. obov. spatul. Lvs, lin. acute, Cal. clavate striped with red 6280 Tufted smooth subviscid, Stems branched at base, Lvs, lin. Fl. panic. Cal, netted, Pet. bifid with lanc. labes

> *** Flowers erect, Calyxes long clavate.
[at base
6i281 Smooth visc. Stems branch. Lvs. lanc. lin. Cal. very long. clav. nett. Pet. obcord. with a tooth on each side 6282 Viscid pubescent, Stems procumbent, Leaves lin. long, Cal. long tubular, Petals slightly emarg. crenate 6283 Tufted viscid pubesc. Root woody, Stems low assurgent little branched, Cal. long netted, Petals bifid 6284 Suffruticose, Stems suberect smooth branched at base, Cal. long cylindr. viscid-villous, Petals 2-lobed 6285 Scabrous, Stems bran. Fl. term. in the dichotomies, Cal. long cylin. Pet. 2-part. tooth. on each side at base 6286 Pubescent, Root woody, Stems diffuse branched, Leaves soft numerous below, Petals half bifid 6287 Tufted viscid pubescent, Stems woody supine branched, Lvs. lin. acute, Petals with narrow diverging lobes 6288 Stems erect pub. Lvs. roughish scarcely ciliat. Fl. large pan. Pet with broad obov. lobes \& 2-part. append. 6289 Very smooth glaucous, Stems branched, Leaves roundish acuminate, F1. large, Cal. not striped 6290 Pilose pubesc. Stems much branch. Lower lvs. ovate-spatul : up. lin. Fl. in large panic. Pet. 2-lob. naked 6291 Pubesc.visc. Stems erect branch. Branch. spread. Low. lvs, ov. spatul Cal. long narrow, Pet bifid crowned 6292 Pubescent, Stems assurgent much branched leafy, Leaves linear acute, Cal. clavate, Petals bifid 6293 Stem simple pubescent, Leaves pubescent: lower large rounded stal ked, Petals 2parted crowned 6294 Smooth, Stem twiggy, Leaves lin, lanc. radical very long, Cal. very long, Petals 2 parted crowned 6295 Smooth clammy, Stem assurgent branch. Lvs, lin. lanc. acute: lower very long, Upper bractes with a broad 6296 Silky, Stems erect hranch. Lvs, wavy, Calyxes long clavate, Pet. 2-part. crowned [membranous margin 6297 Viscid pubescent, Lvs. lanceol. Cal. Iong tubular, Petals lanceolate crowned, Stamens very long 6298 Villous viscid, Lvs. lin. lanceol. obt. ciliated, Peduncle 1-fl. spreading in seed, Cal. circularly reflexed at base 8. Caulescent, Flowers corymbose, Cal. clavate, 10-striped.

6299 Tufted roughish, Root thick woody branch. Stems simple slender very leafy at base, Lvs, small lin. acute 6300 Viscid, Stem much branch. pubesc. Lvs. round subciliated: the lower on long stalks, Fl, loosely corymb.
6301 Very smooth glaucous viscid, Leaves ovate-lanc. Fl. in panicled corymbs, Petals obcordate crowned
6302 Smooth, Stems erect branched, Upper leaves lanceolate: lower linear lanc. Umbel dense, Petals obovate
6303 Lower leaves cordate stalked : upper lanc. sessile, Petals twice as long as calyx
6304 Stems diffuse dichotomous rooting at base, Lowerlvs. ovate stalked cord. : upper sess. Pet, shorter than cal. 6305 Stems procumbent with a lateral 1-sided hairy line, Leaves lanc, very tender, Fruit deflexed

History, Use, Propagation, Cullure,
1050. Arenaria. From arena, sand, in which most of the species are found. They are of most difficult discrimination, and are chiefly diminutive weeds found almost exclusively on sandy soils. The flowers vary

6306 Hairy, Lvs. cord. ovate stem-clasping, Stem dichotomous, F1. solitary, Sepals lanc. ac. longer than petals 6307 Leaves ovate lanceol, nearly veinless, Pedunc. 1-fl. Sepals lanc, acute twice as short as petals
6308 Villous viscid, Leaves lin. lanc. Stems dichotomous diffuse, Petals and capsule longer than calyx
6309 Lvs. lanc. acum, serrulate roughish : the upper broader and shorter, Pedunc. filiform very long, Pet. 2-fid 6310 Stem erect few-f. Lvs, linear acute entire smoothish, Pedunc. filiform very long, Petals 2 parted 6311 Leaves linear smooth at edge, Stems diffuse, Fl. panicled divaricating, Petals the length of calyx
6312 Glaucous, Leaves lin. lanc. smooth at edge, Floral scarious, Petals twice as long as cal. Stem erect weak 6313 Leaves ovate-lanceol. entire smooth thick, Sepals ovate-lanceol. much shorter than petals
\(631 \pm\) Leaves ovate-obl. Pet. deeply divided shorter than calyx, Caps. ovate oblong longer than calyx 6315 Leaves obl. pubescent, Pedunc. 1-f. twin, Pet. larger than cal. Caps. obl. nearly twice as long as sepals 6316 Leaves spatulate, Stem erect bifid viscid, Branches alternate, Petals emarginate
6317 Leaves linear lanc. obtuse very dense, Pedunc. 1-f. and umbelled, Pet. scarcely longer than calyx
6318 Leaves lanc. entire sessile acute, Base and stem pubescent, Fl. axill. solitary
6319 Glandular pubescent, Stem procumbent, Leaves ovate fleshy, Petals scarcely longer than calyx cut 6320 Very smooth, Leaves linear-lanc. Pedunc. terminal dichotomous bracted, Pet. broad obovate 2-parted

8 1. Caps. 3-valved, Leaves linear, with scarious stipules at base.
6321 Smooth, Stem erect, Leaves subulate 1 -sided, Petals shorter than calyx
[calyx
6322 Hispid, Stem erect, Branches divaricating, Lvs, setaceous twice as short as joints, Pet, obt. shorter than 6323 Stems prostrate hairy, Leaves filiform shorter than the joint, Sepals lanceolate obtuse scarious at edge 6324 Like the last, but nearly smooth
6325 Stems prostrate, Leaves half cylindrical fleshy as long as joints, Seeds with a membranous wing 6326 Pilose subhispid, Leaves filiform longer than joint, Stamens 5, Seeds obcord, compressed, Caps. globose

\section*{82. Leaves grassy, linear, lanceolate or rounded, without stipules, Caps, 3-valved.}
* Leaves grassy.

6327 Stems erect simple, Lvs. subul. filiform rough, Panic. trichotomous pubescent lax, Calyxes very obtuse 6328 Leaves subulate-filiform serrulate, Stems erect simple, Panicle trichotomous smooth compact
6329 Leaves lin. setaceous ciliated rough, Stems erect rigid simple, Sepals acute scarcely longer than corolla 6330 Stems ascending few-f. pubescent, Lvs, setaceous rigid, Cauline straight, Sepals obtuse striated villous 6331 Leaves setaceous rigid mucronate striated, Stems panicled few-fl. Sepals lanc. much shorter than corolla
** Leaves subulate or linear.
6332 Lvs. subulate rigid spiny: lower fascicled; upper distant, Stems erect firm, Pet. obov. twice as long as cal. 6333 Erect smooth many-stemmed, Leaves subulate linear erect, Pan, few-fl. Petals conspicuously striated 6334 Leaves subulate tooth-ciliated, Stems ascending 3-6-ft. roughish, Cal, cylindrical, Sepals 3-nerved hairy

6335 Like the last, but stems rigid few-fl. Leaves long straight, Pedunc, and calyx viscid hairy
6336 Lvs. lin. subul. 3-nerved, Stem panicled, Pedunc, terminal very long twin downy, Pet. ubt. emarginate 6337 Like the last, but stems 24-4. Leaves narrow recurved
6338 Lvs, subulate broadish flat 3-nerved ciliated, Radical clustered, Stems 1-fl. Pedunc. very long pubescent
6339 Tufted many-stemmed, Leaves subulate obtuse nerved, Stems panicled elongated
6340 Erect branched, Leaves linear subulate 3-nerved, Pedunc. twin terminal 1-flowered
6341 Leaves subulate, Stems panicled, Sepals ovate
6342 Stems filiform rooting very long diffuse, Flowering branches erect few-fl. Lvs, lin. flat acute fascicled 6343 Leaves subulate setaceous, Stem branched dichotomous, Sepals subulate striated much longer than petals 6344 Stem much branched, Leaves lin, recurved, Sepals with a long point and membranous edge
6345 Radical lvs, clustered recurved subul. 1-sided, Stems tufted simple 3-fl. Sepals and peduncles hairy gland. 6346 Stem much branched, F1. panicled fastigiate, Leaves setaceous fascicled 1-sided ciliated at base 6347 Leaves subulate fascicled setaceous, Stems erect straight simple, Sepals acuminate with 2 lines 6348 Leaves setaceous fascicled with 2 stripes, Stems suffruticose dichotomous, Pedunc. term. 1-2-flowered 6349 Lvs. setaceous not ciliated at base, Stems tufted prostrate at base, Pedunc, longer than leaf, Sepals awned

6350 Procumbent, Leaves linear obt. Peduncles 2 or 31 -flowered with 2 bractes at base, Sepals without nerves 6351 Leaves subulate rigid spiny and flowers whorled, Pedunc. 4-f. capitate
*** Leaves lanceolate, oval or rounded.
6352 Leaves ovate carinate recurved edged imbricated 4 ways, Stems straight downy, Sepals rigid acute keeled 6353 Tufted villous, Branches ascending, Leaves lanceolate narrow acute rigid nerved
6354 Like the last, but smaller, with creeping and tufted stems, and imbricated leaves
6355 Pubescent, Leaves lanc. linear, Barren stems very long procumbent, Pedunc, terminal long l-flowered 6356 Leaves ovate acute sessile regular ciliated and smooth, Sepals lanceolate 3-nerved acute green opaque 6357 Pubescent, Lvs. ovate acute stalked, Stems spreading branched elongated, Sepals acute shorter than cor 6358 Leaves oblong acute 3-nerved ciliated imbricated, Stem prostrate, Sepals lanceolate acuminate striped
6359 Leaves lanc. acute spreading hard rough, Stem simple short, Sepals ovate acuminate striped
6360 Leaves ovate and obovate blistered rugose more or less nerved and ciliated, Stems procumbent 6361 Like the last, but leaves pulpy thick and sepals scarcely nerved
6362 Stem slender branched, Lvs, ovate acute stalked ciliated nerved, Pedunc. long bent down after flowering

unt Miscellaneous Farticulars.
considerably in the number of their stamens, more generally falling short of than exceeding the regulax number.

History, Use, Propagation, Culture,
1051. Cherleria. John Henry Cherler was an assistant of John Bauhin in preparing his Historia Plantarum, A little obscure weed.
1052. Brunnichia. A catalogue of the books upon natural history was published by one Mr. F. Brunnich, a Danish naturalist, in 1793.
1053. Garidella. So named by Tournefort, in honor of Pierre Garidel, M. D., physician at Aix in Provence, author of Histoire des Plantes qui naissent en Provence, 1719, with many figures. A plant of little curiosity or beauty. Small inconspicuous plants of the easiest management.
1054. Malpighia. So named by Plumier in honor of Marcello Malpighi, professor of medicine at Bologna, author of Anatome Plantarum, 1765 and 1769 ; a celebrated work, the best of its time on the structure of vegetables. The species are handsome evergreen trees and shrubs, some of them fruit-bearing and others climbers. M. glabra is grown for its fruit in the West Indies, and the fruit of M. urens is also eaten under the name of Barbadoes cherry, but that of both species is much inferior to European cherries. All the species have the under sides of their leaves covered with prickly bristles which when handled run into the fingers. Ripened cuttings root freely in sand under cover.
1055. Banisteria. So named by Dr. Houstoun, in memory of the Rev. John Banister, a curious botanist, who lost his life in search after plants in Virginia. The species are chiefly evergreen climbers and Iwiners; some of them, as B. fulgens and chrysophylla, have fine shewy foliage as well as beautiful flowers.

6363 Tufted creeping, Leaves ovate shining fleshy ciliated, Pedunc. long 1-f. Flowers cernumus
6364 Leaves ovate acute fleshy approximated, Fl. solitary on short stalks, Sepals obl. acute as long as cor.
\(63 \ldots 5\) All over pubescent, Leaves lin. lanceol. Stems prostrate much branched, Seeds very minute

\section*{6366 Leaves spreading}

6367 Leaves cordate sagittate
6368 Petals sessile spreading, Stamens 10-12
6369 Leaves ovate entire smooth, Peduncles umbelled
6370 Leaves ovate entire smooth, Peduncles 1 -flowered
6371 Leaves entire oblong acute smooth shining with 2 glands beneath at the base
6372 Leaves entire oblong lanceolate acute smooth with 2 glands at a distance from the base
6373 Leaves ovate nearly entire with hairs on both sides, Fl.-stalks with a truncate gland at top
6374 Leaves ovate elliptical acuminate entire smooth with 2 glands at base
6375 Leaves oblong acuminate entire smooth, Racemes axillary, Fl. monogynous
6376 Leaves elliptical shining hairy beneath, Fl. axillary corymbose
6377 Leaves obl. ovate with decumbent stiff bristles, Peduncles 1-fl. aggregate
6378 Leaves lin. lanceol. with decumbent bristles on each side, Peduncles umbelied
6379 Leaves obl. obtuse pubescent, Racemes axillary compound
6380 Leaves ovate entire obtuse downy beneath, Racemes terminal
6381 Leaves ovate downy beneath acute, Flowers yellow spiked
6382 Leaves obovate wedge-shaped entire veinless shining, Raceme terminal
6383 Leaves ovate acute entire smooth on each side, Racemes terminal spiked
6384 Leaves oval acuminate shining, Racemes corymbose terminal
6385 Leaves lanceol, toothed-spiny hispid beneath
6386 Leaves subovate toothed-spiny
6387 Leaves orbicular cordate ciliate toothletted smooth, Petioles with 2 glands
6388 Leaves roundish ovate obtuse smooth, Racemes axillary and terminal, Seeds erect
6389 Leaves ovate oblong acutish towards the end obsoletely ciliated beneath shining gold-colored 6390 Leaves ovate-oblong rigid, Racemes terminal
6391 Leaves ovate oblong entire beneath shining, Panicle terminal leafy
6392 Branches 2-edged, Leaves ovate downy beneath, Petioles with 2 glands
6393 Leaves subovate downy beneath, Racemes brachiate, Peduncles umbelled
6394 Leaves downy beneath orbicular cordate, Branches divaricating roundish, Petioles with 2 glands
6395 Leaves subovate, Branches brachiate, Seeds narrower inwards
6396 Leaves simple obovate obtuse pubescent above smooth beneath
6397 Leaves pinnated, Leafets ovate stalked smooth on each side, Racemes fascicled

PENTAGYNIA.
6398 Leaves pinnated, Leaflets ovate-lanceolate, Fruit oblong with obtuse angles 6399 Leaflets ovate unequal acuminate, Fruit obl, acute-angled

and Miscellaneous Particulars.
All of them root freely in ripened wood in sand under a hand-glass, In most respects they resemble the last genus.
1056. Hiraa. Named after John Nicholas de la Hire, a French physician, who died in 1727. Plants with the appearance of Banisteria.
1057. Cnestis. From xymit, to scratch. The capsules, covered with hairs, excite a troublesome itching. Fine evergreen stove shrubs.
1058. Averrhoa. So named in honor of Ebn Elvelid Ebn Rushad, commonly called Averrhoes, of Corduba in Spain, a famous commentator on Aristotle and Avicenna. He also published Calliget, or the plants used in food, \&c. He died at the beginning of the thirteenth century. The specific names are vernacular appellations. The species are evergreen trees, singular for the fruit growing frequently on the trunk itself, below the leaves: the flowers grow in racemes; the fruit is a five-celled pome. A. Bilimbi is a beautiful tree with a green fleshy oblong fruit the thickness of the finger, filled with a grateful acid juice; the substance and seeds not unlike those of cucumber. They make a syrup of the juice, and a conserve of the flowers, which are esteemed excellent in fevers and bilious disorders. A. carambola bears a fruit the size of a hen's egg, with a pulpy subacid juice, used ripe and also pickled green, and employed also in dying, and other economical purposes. The petioles and branches of this tree are said to have a peculiar sensitive quality, of which an account is given by Dr. Bruce in the Philosophical Transactions,

History, Use, Propagation, Culture,
Both species form handsome plants in our stoves; they grow freely, and ripened cuetings root readily in sand under a hand glass.
1059. Spondias. One of the Greek names of the plum. The plants of this genus bear fruit like plums, which are also called hog plums in the West Indies. These are deciduous fruit-bearing trees, natives or cultivated in both Indies. S. Mombin (the South American name) flowers from the sides of the branches, and is known by its oblong or ovate fruit like a plum, having a luscious thin pulp covering a large fibrous stone The skin is yellow, purple, or variegated; the pulp is yellow and thin, having a singular but not unpleasant taste, and a sweet smell. The seed scarcely ever ripens, but it is so easily increased by cuttings, that if a branch laden with young fruit be set in the ground, it will grow, and the fruit will soon come to maturity. In St. Domingo they make hedges of the boughs, which flower and bear fruit in a few months. It is also cultivated for the sake of the fruit, though it is not in much esteem in Jamaica.

The flowers of S. Myrobalanus (the Myrobalanus of Dioscorides was an Egyptian or Arabian tree, which

6400 Common petiole compressed
6401 Common petiole round, Leaves shining acuminate
6402 Common petiole round with 6 pairs of leaflets which are serrated and ribbed
6403 Leaves orbicular spatulate powdery obtuse with a point, Fl. panicled, Stem erect branched
6404 Leaves ovate spatulate obtuse powdery with a point edged with red, Fl. panicled, Stem erect branched
6405 Leaves opp. rounded ovate, Flowers corymbose
6406 Leaves obl. spatulate obtuse smooth with a point, Fl. panicled, Stem erect branched
6407 Leaves semicylindrical scattered, F1. panicled nodding, Tube curved
6408 Leaves ovate spatulate obtuse with a point powdery, Fl. panicled, Stem much branched divaricating
6409 Leaves wedge-shaped fascicled, Stem thickened, Branches fleshy conical
6410 Leaves obovate acute fleshy, Spike leafy terminal
6411 Leaves crossing rounded mucronate glaucous, F1. panicled pendulous
6412 Leaves half orbicular scurfy dotted flat above, Fl. few small sessile
6413 Leaves spatulate obtuse naked with a point
6414 Leaves glaucous narrow tongue-shaped at the end obcuneate mucronate, Fl. cymose, Stem leafy
6415 Leaves oval crenate, Stem spiked
6416 Leaves oblong nearly round, Flowers fascicled
6417 Leaves lanceolate acute fleshy, Spike cylindrical terminal leafiess
6418 Leaves peltate crenate, Stem nearly simple, Fl. pendulous, Bractes entire
6419 Leaves peltate crenate, Stem nearly simple, Flowers erect, Bractes toothed

\section*{6420 Leaves whorled 4}

6421 Leaves amplexicaul. cordate ovate obtuse unequally and deeply serrated
6422 Leaves amplexicaul. cordate oblong obtusely serrated whitish
6423 Leaves flattish serrated, Corymb leafy, Stem erect
6424 Leaves flat ovate acute at each end toothed, Flowers in corymbose fascicles
6425 Leaves wedge-shaped narrowed at the base subsessile, Stems decumbent, Fl. corymbose
6426 Leaves wedge-shaped rhomboid emarginate stalked, Stems branched, Pan. term. divaricating
6427 Leaves lanceolate serrated flat, Stem erect, Cyme sessile terminal
6428 Leaves roundish obovate flat crenated at end with a cartilaginous muricated edge
6429 Leaves flat opposite spatulate toothed
6430 Leaves wedge-shaped concave somewhat toothed aggregate, Branches creeping, Cyme terminal
